ally emerges in a form accessible to observation round about the third or fourth year of life.[2]

1 We are able to make use of the second of these two sources of material since we are justified in expecting that the early years of children who are later to become neurotic are not likely in this respect to differ *essentially* from those of children who are to grow up into normal adults, [*added* 1915:] but only in the intensity and clarity of the phenomena involved.

2 There is a possible anatomical analogy to what I believe to be the course of development of the infantile sexual function in Bayer's discovery (1902) that the internal sexual organs (i.e. the uterus) are as a rule larger in newborn children than in older ones. It is not certain, however, what view we should take of this involution that occurs after birth (which has been shown by Halban to apply also to other portions of the genital apparatus). According to Halban (1904) the process of involution comes to an end after a few weeks of extrauterine life. [*Added* 1920:] Those authorities who regard the interstitial portion of the sex gland as the organ that determines sex have on their side been led by anatomical researches to speak of infantile sexuality and a period of sexual latency. I quote a passage from Lipschütz's book (1919, 168), which I mentioned on p. 131 *n.*: 'We shall be doing more justice to the facts if we say that the maturation of the sexual characters which is accomplished at puberty is only due to a great acceleration which occurs at that time of processes which began much earlier – in my view as early as during intrauterine life.' 'What has hitherto been described in a summary way as puberty is probably only a second major phase of puberty which sets in about the middle of the second decade of life . . . Childhood, from birth until the beginning of this second major phase, might be described as "the intermediate phase of puberty"' (ibid., 170). Attention was drawn to this coincidence between anatomical findings and psychological observation in a review [of Lipschütz's book] by Ferenczi (1920). The agreement is marred only by the fact that the 'first peak' in the development of the sexual organ occurs during the early intrauterine period, whereas the early efflorescence of infantile sexual life must be ascribed to the third and fourth years of life. There is, of course, no need to expect that anatomical growth and psychical development must be exactly simultaneous. The researches in question were made on the sex glands of human beings. Since a period of latency in the psychological sense does not occur in animals, it would be very interesting to know whether the anatomical findings which have led these writers to assume the occurrence of two peaks in sexual development are also demonstrable in the higher animals.

Sexual Inhibitions[1]

It is during this period of total or only partial latency that are built up the mental forces which are later to impede the course of the sexual drive and, like dams, restrict its flow – disgust, feelings of shame and the claims of aesthetic and moral ideals. One gets an impression from civilized children that the construction of these dams is a product of education, and no doubt education has much to do with it. But in reality this development is organically determined and fixed by heredity, and it can
[178] occasionally occur without any help at all from education. Education will not be trespassing beyond its appropriate domain if it limits itself to following the lines which have already been laid down organically and to impressing them somewhat more clearly and deeply.

Reaction-formation and Sublimation

What is it that goes to the making of these constructions which are so important for the growth of a civilized and normal individual? They probably emerge at the cost of the infantile sexual impulses [*Sexualregungen*] themselves. Thus the activity of those impulses does not cease even during this period of latency, though their energy is diverted, wholly or in great part, from their sexual use and directed to other ends. Historians of civilization [*Kulturhistoriker*] appear to be at one in assuming that powerful components are acquired for every kind of cultural achievement [*kulturellen Leistungen*] by this diversion of sexual drive forces [*sexueller Triebkräfte*] from sexual aims and their direction to new ones – a process which deserves the name of 'sublimation'. To this we would add, accordingly, that the same process plays a part in the development of the individual and we would place its beginning in the period of sexual latency of childhood.[2]

It is possible further to form some idea of the mechanism of this process of sublimation. On the one hand, it would seem, the sexual impulses cannot be utilized during these years of childhood, since the reproductive functions have been deferred [*aufgeschoben*] – a fact which constitutes the main feature of the period of latency. On the other hand, these impulses would seem in themselves to be perverse – that is, to arise from erotogenic zones and to derive their activity from drives which, in view of the direction of the subject's development, can only arouse unpleasurable feelings. They consequently evoke opposing mental forces (reacting impulses) which, in order to suppress this unpleasure

Hemmung

1 [*Sexualhemmungen*.][T]

2 Once again, it is from Fliess that I have borrowed the term 'period of sexual latency'.

effectively, build up the mental dams that I have already mentioned – disgust, shame and morality.[1]

Interruptions of the Latency Period

We must not deceive ourselves as to the hypothetical nature and insufficient clarity of our knowledge concerning the processes of the infantile period of latency or deferment; but we shall be on firmer ground in pointing out that such an application of infantile sexuality represents an educational ideal from which individual development usually diverges at some point and often to a considerable degree. From time to time a fragmentary manifestation of sexuality which has evaded sublimation may break through; or some sexual activity may persist through the whole duration of the latency period until the sexual drive emerges with greater intensity at puberty. Insofar as educators pay any attention at all to infantile sexuality, they behave exactly as though they shared our views as to the construction of the moral defensive forces at the cost of sexuality, and as though they knew that sexual activity makes a child ineducable: for they stigmatize every sexual manifestation by children as a 'vice', without being able to do much against it. We, on the other hand, have every reason for turning our attention to these phenomena which are so much dreaded by education, for we may expect them to help us to discover the original configuration of the sexual drives. [179]

[2] THE MANIFESTATIONS OF INFANTILE SEXUALITY

Thumbsucking

For reasons which will appear later, I shall take thumbsucking (or sensual sucking) as a sample of the sexual manifestations of childhood. (An excellent study of this subject has been made by the Hungarian paediatrician Lindner, 1879.)[2]

1 [*Footnote added* 1915:] In the case which I am here discussing, the sublimation of sexual drive forces takes place along the path of reaction-formation. But in general it is possible to distinguish the concepts of sublimation and reaction-formation from each other as two different processes. Sublimation can also take place by other and simpler mechanisms. [Further theoretical discussions of sublimation can be found in Section III of Freud's paper on narcissism (1914*c*), *RSE*, **14**, 82, and at several points in *The Ego and the Id* (1923*b*, Chapters III, IV and V), ibid., **19**, 24–53.]

2 [There seems to be no nursery word in English equivalent to the German '*lutschen*' and '*ludeln*', used by Freud alongside '*wonnesaugen*' ('sensual sucking'). Conrad in *Struwwelpeter* was a '*Lutscher*'; but, as will be seen from the context, 'suck-a-thumbs' and 'thumbsucking' have in fact too narrow a connotation for the present purpose.]

Thumbsucking appears already in early infancy and may continue into maturity, or even persist all through life. It consists in the rhythmic repetition of a sucking contact by the mouth (or lips). [180] There is no question of the purpose of this procedure being the taking of nourishment. A portion of the lip itself, the tongue, or any other part of the skin within reach – even the big toe – may be taken as the object upon which this sucking is carried out. In this connection a grasping drive [*Greiftrieb*] may appear and may manifest itself as a simultaneous rhythmic tugging at the lobes of the ears or a catching hold of some part of another person (as a rule the ear) for the same purpose. Sensual sucking involves a complete absorption of the attention and leads either to sleep or even to a motor reaction in the nature of an orgasm.[1] It is not infrequently combined with rubbing some sensitive part of the body such as the breast or the external genitalia. Many children proceed by this path from sucking to masturbation.

Lindner himself[2] clearly recognized the sexual nature of this activity and emphasized it without qualification. In the nursery, sucking is often classed along with the other kinds of sexual 'naughtiness' of children. This view has been most energetically repudiated by numbers of paediatricians and nerve specialists, though this is no doubt partly due to a confusion between 'sexual' and 'genital'. Their objection raises a difficult question and one which cannot be evaded: what is the general characteristic which enables us to recognize the sexual manifestations of children? The concatenation of phenomena into which we have been given an insight by psychoanalytic investigation justifies us, in my [181] opinion, in regarding thumbsucking as a sexual manifestation and in choosing it for our study of the essential features of infantile sexual activity.[3]

1 Thus we find at this early stage, what holds good all through life, that sexual satisfaction is the best soporific. Most cases of nervous insomnia can be traced back to lack of sexual satisfaction. It is well known that unscrupulous nurses put crying children to sleep by stroking their genitals. [Cf. p. 87 *n.* 3 above.]

2 [This paragraph was added in 1915. In its place the following paragraph appears in the editions of 1905 and 1910 only: 'No observer has felt any doubt as to the sexual nature of this activity. Nevertheless, the best theories formed by adults in regard to this example of the sexual behaviour of children leave us in the lurch. Consider Moll's [1898] analysis of the sexual drive into a detumescence drive and a contrectation drive. [See above, p. 151 *n.*] The first of these factors cannot be concerned in our present instance, and the second one can only be recognized with difficulty, since, according to Moll, it emerges later than the detumescence drive and is directed towards other people.' – In 1910 the following footnote was attached to the first sentence of this cancelled paragraph: 'With the exception of Moll (1909).']

3 [*Footnote added* 1920:] In 1919, a Dr Galant published, under the title of 'Das Lutscherli', the confession of a grown-up girl who had never given up this infantile sexual activity and who represents the satisfaction to be gained from sucking as something completely analogous to sexual satisfaction, particularly when this is obtained from a lover's kiss: 'Not every kiss is equal to a "*Lutscherli*" – no, no, not by any means! It is impossible to describe what a lovely feeling

Auto-erotism

We are duty bound to make a thorough examination of this example. It must be insisted that the most striking feature of this sexual activity is that the drive is not directed towards other people, but obtains satisfaction from the subject's own body. It is 'auto-erotic', to call it by a happily chosen term introduced by Havelock Ellis [1898*a*].[1]

Furthermore, it is clear that the behaviour of a child who indulges in thumbsucking is determined by a search for some pleasure which has already been experienced and is now remembered. In the simplest case he proceeds to find this satisfaction by sucking rhythmically at some part of the skin or mucous membrane. It is also easy to guess the occasions on which the child had his first experiences of the pleasure which he is now striving to renew. It was the child's first and most vital activity, his sucking at his mother's breast, or at substitutes for it, that must have familiarized him with this pleasure. The child's lips, in our view, behave like an erotogenic zone, and no doubt stimulation by the warm flow of milk is the cause of the pleasurable sensation. The satisfaction of the erotogenic zone is associated, in the first instance, with the satisfaction of the need for nourishment. To begin with, sexual activity attaches itself [182] *Anlehnung*
to [*lehnt sich an*][T] one of the functions serving the purpose of self-preservation and does not become independent of them until later.[2] No-one who has seen a baby sinking back satiated from the breast and falling asleep with flushed cheeks and a blissful smile can escape the reflection that this picture persists as a prototype of the expression of sexual satisfaction in later life. The need for repeating the sexual satisfaction now becomes detached from the need for taking nourishment – a separation which becomes inevitable when the teeth appear and food is no longer taken in only by sucking, but is also chewed up. The child does not make use of an extraneous body for his sucking, but prefers a part of his own skin because it is more convenient, because it makes him independent of the external world, which he is not yet able to control, and because in that way he provides himself, as it were, with a second

goes through your whole body when you suck; you are right away from this world. You are absolutely satisfied, and happy beyond desire. It is a wonderful feeling; you long for nothing but peace – uninterrupted peace. It is just unspeakably lovely: you feel no pain and no sorrow, and ah! you are carried into another world.'

1 [*Footnote added* 1920:] Havelock Ellis, it is true, uses the word 'auto-erotic' in a somewhat different sense, to describe an excitation which is not provoked from outside but arises internally. What psychoanalysis regards as the essential point is not the genesis of the excitation, but the question of its relation to an object. – [In all editions before 1920 this footnote read as follows: 'Havelock Ellis, however, has spoilt the meaning of the term he invented by including the whole of hysteria and all the manifestations of masturbation among the phenomena of auto-erotism.']

2 [This sentence was added in 1915. Cf. Section II of Freud's paper on narcissism (1914*c*), *RSE*, **14**, 72 f.]

erotogenic zone, though one of an inferior kind. The inferiority of this second region is among the reasons why at a later date he seeks the corresponding part – the lips – of another person. ('It's a pity I can't kiss myself', he seems to be saying.)

It is not every child who sucks in this way. It may be assumed that those children do so in whom there is a constitutional intensification of the erotogenic significance of the labial region. If that significance persists, these same children when they are grown up will become epicures in kissing, will be inclined to perverse kissing, or, if males, will have a powerful motive for drinking and smoking. If, however, repression ensues, they will feel disgust at food and will produce hysterical vomiting. The repression extends to the nutritional drive owing to the dual purpose served by the labial zone. Many[1] of my women patients who suffer from disturbances of eating, *globus hystericus*, constriction of the throat and vomiting, have indulged energetically in sucking during their childhood.

Our study of thumbsucking or sensual sucking has already given us the three essential characteristics of an infantile sexual manifestation. At its origin it attaches itself to [*in Anlehnung an*] one of the vital somatic functions;[2] it has as yet no sexual object, and is thus auto-erotic; and its
[183] sexual aim is dominated by an erotogenic zone. It is to be anticipated that these characteristics will be found to apply equally to most of the other activities of the infantile sexual drives.

[3] THE SEXUAL AIM OF INFANTILE SEXUALITY

Characteristics of Erotogenic Zones

The example of thumbsucking shows us still more about what constitutes an erotogenic zone. It is a part of the skin or mucous membrane in which stimuli of a certain sort evoke a feeling of pleasure possessing a particular quality. There can be no doubt that the stimuli which produce the pleasure are governed by special conditions, though we do not know what those are. A rhythmic character must play a part among them and the analogy of tickling is forced upon our notice. It seems less certain whether the character of the pleasurable feeling evoked by the stimulus should be described as a 'specific' one – a 'specific' quality in which the sexual factor would precisely lie. Psychology is still so much in the dark in questions of pleasure and unpleasure that the most cautious

1 [In the first edition only this reads 'all'.]

2 [This clause was added in 1915; and in the earlier editions the word 'three' in the last sentence is replaced with 'two'.]

assumption is the one most to be recommended. We may later come upon reasons which seem to support the idea that the pleasurable feeling does in fact possess a specific quality.

The character of erotogenicity can be attached to some parts of the body in a particularly marked way. There are predestined erotogenic zones, as is shown by the example of sucking. The same example, however, also shows us that any other part of the skin or mucous membrane can take over the functions of an erotogenic zone, and must therefore have some aptitude in that direction. Thus the quality of the stimulus has more to do with producing the pleasurable feeling than has the nature of the part of the body concerned. A child who is indulging in sensual sucking searches about his body and chooses some part of it to suck – a part which is afterwards preferred by him from force of habit; if he happens to hit upon one of the predestined regions (such as the nipples or genitals) no doubt it retains the preference. A precisely analogous tendency to displacement is also found in the symptomatology of hysteria. In that neurosis repression affects most of all the actual genital zones and these transmit their susceptibility to stimulation to other erotogenic zones (normally neglected in adult life), which then behave exactly like genitals. But besides this, precisely as in the case of sucking, [184] any other part of the body can acquire the same susceptibility to stimulation as is possessed by the genitals and can become an erotogenic zone. Erotogenic and hysterogenic zones show the same characteristics.[1]

The Infantile Sexual Aim

The sexual aim of the infantile drive consists in obtaining satisfaction by means of an appropriate stimulation of the erotogenic zone which has been selected in one way or another. This satisfaction must have been previously experienced in order to have left behind a need for its repetition; and we may expect that Nature will have made safe provisions so that this experience of satisfaction shall not be left to chance.[2] We have already learnt what the contrivance is that fulfils this purpose in the case of the labial zone: it is the simultaneous connection which links this part of the body with the taking in of nourishment. We shall come across

1 [*Footnote added* 1915:] After further reflection and after taking other observations into account, I have been led to ascribe the quality of erotogenicity to all parts of the body and to all the internal organs. Cf. also in this connection what is said below on narcissism [p. 191 f.]. [In the 1910 edition only, the following footnote appeared at this point: 'The biological problems relating to the hypothesis of erotogenic zones have been discussed by Alfred Adler (1907).']

2 [*Footnote added* 1920:] In biological discussions it is scarcely possible to avoid a teleological way of thinking, even though one is aware that in any particular instance one is not secure against error. [Cf. p. 139 *n*. 1 above and p. 167 *n*. 1 below.]

other, similar contrivances as sources of sexuality. The state of being in need of a repetition of the satisfaction reveals itself in two ways: by a peculiar feeling of tension, possessing, rather, the character of unpleasure, and by a sensation of itching or stimulation which is centrally conditioned and projected on to the peripheral erotogenic zone. We can therefore formulate a sexual aim in another way: it consists in replacing the projected sensation of stimulation in the erotogenic zone with an external stimulus which removes that sensation by producing a feeling of satisfaction. This external stimulus will usually consist in some kind of manipulation that is analogous to the sucking.[1]

[185] The fact that the need can also be evoked peripherally, by a real modification of the erotogenic zone, is in complete harmony with our physiological knowledge. This strikes us as somewhat strange only because, in order to remove one stimulus, it seems necessary to adduce a second one at the same spot.

[4] MASTURBATORY SEXUAL MANIFESTATIONS[2]

It must come as a great relief to find that, when once we have understood the nature of the drive arising from a single one of the erotogenic zones, we shall have very little more to learn of the sexual activity of children. The clearest distinctions as between one zone and another concern the nature of the contrivance necessary for satisfying the drive; in the case of the labial zone it consisted of sucking, and this has to be replaced by other muscular actions according to the position and nature of the other zones.

Activity of the Anal Zone

Like the labial zone, the anal zone is well suited by its position to act as a medium through which sexuality may attach itself to [*eine Anlehnung zu*] other somatic functions. It is to be presumed that the erotogenic

1 [This account of the way in which a particular sexual desire becomes established on the basis of an 'experience of satisfaction' is only a special application of Freud's general theory of the mechanism of wishes, as explained in Section C of Chapter VII of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 505 f. This theory had already been sketched out by him in his posthumously published 'Project for a Scientific Psychology' (Freud, 1950*a*, Part I, Section 16; ibid., **1**). In both these passages the example chosen as an illustration is in fact that of an infant at the breast. The whole topic links up with Freud's views on 'reality-testing', as discussed, for instance, in his paper on 'Negation' (1925*h*), ibid., **19**, 239–40.]

2 Cf. the very copious literature on the subject of masturbation, which for the most part, however, is at sea upon the main issues, e.g. Rohleder (1899). [*Added* 1915:] See also the report of the discussion on the subject in the Vienna Psychoanalytical Society (*Diskussionen*, 1912) – [and especially Freud's own contributions to it (1912*f*), *RSE*, **12**, 239 ff.].

significance of this part of the body is very great from the first. We learn with some astonishment from psychoanalysis of the transmutations normally undergone by the sexual excitations arising from this zone and of the frequency with which it retains a considerable amount of susceptibility to genital stimulation throughout life.[1] The intestinal disturbances which are so common in childhood see to it that the zone shall not lack [186] intense excitations. Intestinal catarrhs at the tenderest age make children 'nervy', as people say, and in cases of later neurotic illness they have a determining influence on the symptoms in which the neurosis is expressed, and they put at its disposal the whole range of intestinal disturbances. If we bear in mind the erotogenic significance of the outlet of the intestinal canal, which persists, at all events in a modified form, we shall not be inclined to scoff at the influence of haemorrhoids, to which old-fashioned medicine used to attach so much importance in explaining neurotic conditions.

Children who are making use of the susceptibility to erotogenic stimulation of the anal zone betray themselves by holding back their stool till its accumulation brings about violent muscular contractions and, as it passes through the anus, is able to produce powerful stimulation of the mucous membrane. In so doing it must no doubt cause not only painful but also highly pleasurable sensations. One of the clearest signs of subsequent eccentricity or nervousness is to be seen when a baby obstinately refuses to empty his bowels when he is put on the pot – that is, when his nurse wants him to – and holds back that function till he himself chooses to exercise it. He is naturally not concerned with dirtying the bed, he is only anxious not to miss the subsidiary pleasure attached to defaecating. Educators are once more right when they describe children who keep the process back as 'naughty'.

The contents of the bowels,[2] which act as a stimulating mass upon a sexually sensitive portion of mucous membrane, behave like forerunners of another organ, which is destined to come into action after the phase of childhood. But they have other important meanings for the infant. They are clearly treated as a part of the infant's own body and represent his first 'gift': by producing them he can express his active compliance with his environment and, by withholding them, his disobedience. From being a 'gift' they later come to acquire the meaning of 'baby' – for

1 [*Footnote added* 1910:] Cf. my papers on 'Character and Anal Erotism' (1908*b*) [*RSE*, **9**, 149 ff.] [*added* 1920:] and 'On Transformations of Drive as Exemplified in Anal Erotism' (1916–17*e*) [ibid., **17**, 115 ff.].

2 [This paragraph was added in 1915. Its subject was expanded on in one of the papers (1916–17*e*) mentioned in footnote 1 above.]

babies, according to one of the sexual theories of children [see below, p. 173], are acquired by eating and are born through the bowels.

The retention of the faecal mass, which is thus carried out intentionally by the child to begin with, in order to serve, as it were, as a masturbatory stimulus upon the anal zone or to be employed in his relation to the people looking after him, is also one of the roots of the constipation which is so common among neuropaths. Further, the whole significance of the anal zone is reflected in the fact that few neurotics are to be found without their special scatological practices, ceremonies, and so on, which they carefully keep secret.[1]

[187]

Actual masturbatory stimulation of the anal zone by means of the finger, provoked by a centrally determined or peripherally maintained sensation of itching, is by no means rare among older children.

Activity of the Genital Zones

Among the erotogenic zones that form part of the child's body there is one which certainly does not play the opening part, and which cannot be the vehicle of the oldest sexual impulses, but which is destined to great things in the future. In both male and female children it is brought into connection with micturition (in the glans and clitoris) and in the former is enclosed in a pouch of mucous membrane, so that there can be no lack of stimulation of it by secretions which may give an early start to sexual excitation. The sexual activities of this erotogenic zone, which forms part of the sexual organs proper, are the beginning of what is later to become 'normal' sexual life. The anatomical situation of this region, the secretions in which it is bathed, the washing and rubbing to which it is subjected in the course of a child's toilet, as well as accidental stimulation (such as the movement of intestinal worms in the case of girls), make it inevitable that the pleasurable feeling which this part of the body is capable of producing should be noticed by children even during their earliest infancy, and should give rise to a need for its repetition. If we

[188]

1 [*Footnote added* 1920:] Lou Andreas-Salomé (1916), in a paper which has given us a very much deeper understanding of the significance of anal erotism, has shown how the history of the first prohibition which a child comes across – the prohibition against getting pleasure from anal activity and its products – has a decisive effect on his whole development. This must be the first occasion on which the infant has a glimpse of an environment hostile to his drive impulses, on which he learns to separate his own entity from this alien one and on which he carries out the first 'repression' of his possibilities for pleasure. From that time on, what is 'anal' remains the symbol of everything that is to be repudiated and excluded from life. The clear-cut distinction between anal and genital processes which is later insisted upon is contradicted by the close anatomical and functional analogies and relations which hold between them. The genital apparatus remains the neighbour of the cloaca, and actually [to quote Lou Andreas-Salomé] 'in the case of women is only taken from it on lease'.

consider this whole range of contrivances and bear in mind that both making a mess and measures for keeping clean are bound to operate in much the same way, it is scarcely possible to avoid the conclusion that the foundations for the future primacy over sexual activity exercised by this erotogenic zone are established by early infantile masturbation, which scarcely a single individual escapes.[1] The action which disposes of the stimulus and brings about satisfaction consists in a rubbing movement with the hand or in the application of pressure (no doubt on the lines of a pre-existing reflex) either from the hand or by bringing the thighs together. This last method is by far the more common in the case of girls. The preference for the hand which is shown by boys is already evidence of the important contribution which the drive to mastery is destined to make to masculine sexual activity.[2]

It will be in the interests of clarity[3] if I say at once that three phases of [189] infantile masturbation are to be distinguished. The first of these belongs to early infancy, and the second to the brief efflorescence of sexual activity about the fourth year of life; only the third phase corresponds to pubertal masturbation, which is often the only kind taken into account.

Second Phase of Infantile Masturbation

The masturbation of early infancy seems to disappear after a short time; but it may persist uninterruptedly until puberty, and this would constitute the first great deviation from the course of development laid down for civilized men. At some point of childhood after early infancy, as a rule before the fourth year, the sexual drive belonging to the genital

1 [In the editions of 1905 and 1910 the last part of this sentence read: 'it is difficult to overlook Nature's purpose of establishing the future primacy over sexual activity exercised by this erotogenic zone by means of early infantile masturbation, which scarcely a single individual escapes.' The teleological nature of this argument in favour of the universality of infantile masturbation was sharply criticized by Rudolf Reitler in the course of the discussions on that topic in the Vienna Psychoanalytical Society in 1912 (*Diskussionen*, 1912, 92 f.). In his own contribution to the discussion (ibid., 134; = Freud, 1912*f*), Freud agreed that the phrasing he had used was unfortunate, and undertook to alter it in later reprints. The present version of the sentence was accordingly substituted in 1915. Cf. pp. 139 and *n*. 1 and 163 and *n*. 2 above.]

2 [*Footnote added* 1915:] Unusual techniques in carrying out masturbation in later years seem to point to the influence of a prohibition against masturbation which has been overcome.

3 [This paragraph was added in 1915. In the edition of that year there were also added the title of the next paragraph and the parenthesis 'as a rule before the fourth year' in its second sentence. Moreover, in the first sentence of the same paragraph the words 'after a short time' were substituted for the words 'at the onset of the latency period' which had appeared in 1905 and 1910. Finally, in those first two editions, the *following* paragraph began with the words 'During the years of childhood (it has not yet been possible to generalize as to the chronology) the sexual excitation of early infancy returns . . .' The motive for all these changes made in 1915 was evidently to distinguish more sharply between the second and first phases of infantile sexual activity and to assign a more precise date – 'about the fourth year' – to the second phase.]

zone usually revives and persists again for a time until it is once more suppressed, or it may continue without interruption. This second phase of infantile sexual activity may assume a variety of different forms which can only be determined by a precise analysis of individual cases. But all its details leave behind the deepest (unconscious) impressions in the subject's memory, determine the development of his character, if he is to remain healthy, and the symptomatology of his neurosis, if he is to fall ill after puberty.[1] In the latter case we find that this sexual period has been forgotten and that the conscious memories that bear witness to it have been displaced. (I have already mentioned that I am also inclined to relate normal infantile amnesia to this infantile sexual activity.) Psychoanalytic investigation enables us to make what has been forgotten conscious and thus do away with a compulsion that arises from the unconscious psychical material.

Return of Early Infantile Masturbation

[190] During the years of childhood with which I am now dealing, the sexual excitation of early infancy returns, either as a centrally determined tickling stimulus which seeks satisfaction in masturbation, or as a process in the nature of a nocturnal emission which, like the nocturnal emissions of adult years, achieves satisfaction without the help of any action by the subject. The latter case is the more frequent with girls and in the second half of childhood; its determinants are not entirely intelligible and often, though not invariably, it seems to be conditioned by a period of earlier *active* masturbation. The symptoms of these sexual manifestations are scanty; they are mostly displayed on behalf of the still undeveloped sexual apparatus by the *urinary* apparatus, which thus acts, as it were, as the former's trustee. Most of the so-called bladder disorders of this period are sexual disturbances: nocturnal enuresis, unless it represents an epileptic fit, corresponds to a nocturnal emission.

The reappearance of sexual activity is determined by internal causes and external contingencies, both of which can be guessed in cases of neurotic illness from the form taken by their symptoms and can be discovered with certainty by psychoanalytic investigation. I shall have to speak presently of the internal causes; great and lasting importance attaches at this period to the accidental *external* contingencies. In the

1 [*Footnote added* 1915:] The problem of why the sense of guilt of neurotics is, as Bleuler [1913*a*] recently recognized, regularly attached to the memory of some masturbatory activity, usually at puberty, still awaits an exhaustive analytic explanation. [*Added* 1920:] The most general and most important factor concerned must no doubt be that masturbation represents the executive agency of the whole of infantile sexuality and is, therefore, able to take over the sense of guilt attaching to it. [Cf. Freud (1919*e*), *RSE*, **17**, 189.]

foreground we find the effects of seduction, which treats a child as a sexual object prematurely and teaches him, in highly emotional circumstances, how to obtain satisfaction from his genital zones, a satisfaction which he is then usually obliged to repeat again and again by masturbation. An influence of this kind may originate either from adults or from other children. I cannot admit that in my paper on 'The Aetiology of Hysteria' (1896*c*) I exaggerated the frequency or importance of that influence, though I did not then know that persons who remain normal may have had the same experiences in their childhood, and though I consequently overrated the importance of seduction in comparison with the factors of sexual constitution and development.[1] Obviously seduction is not required in order to arouse a child's sexual life; that can also come [191] about spontaneously from internal causes.

Polymorphously Perverse Disposition

It is an instructive fact that under the influence of seduction children can become polymorphously perverse, and can be led into all possible kinds of sexual irregularities. This shows that an aptitude for them is innately present in their disposition. There is consequently little resistance towards carrying them out, since the mental dams against sexual excesses – shame, disgust and morality – have either not yet been constructed at all or are only in course of construction, according to the age of the child. In this respect children behave in the same kind of way as an average uncultivated woman in whom the same polymorphously perverse disposition persists. Under ordinary conditions she may remain normal sexually, but if she is led on by a clever seducer she will find every sort of perversion to her taste, and will retain them as part of her own sexual activities. Prostitutes exploit the same polymorphous, that is, infantile, disposition for the purposes of their profession; and, considering the immense number of women who are prostitutes or who must be supposed to have an aptitude for prostitution without becoming engaged in it, it becomes impossible not to recognize that this same

1 [See Freud's detailed discussion of this in his second paper on the part played by sexuality in the neuroses (1906*a*: this volume, p. 283 f.).] Havelock Ellis [1903, Appendix B] has published a number of autobiographical narratives written by people who remained predominantly normal in later life and describing the first sexual impulses of their childhood and the occasions which gave rise to them. These reports naturally suffer from the fact that they omit the prehistoric period of the writers' sexual lives, which is veiled by infantile amnesia and which can only be filled in by psychoanalysis in the case of an individual who has developed a neurosis. In more than one respect, nevertheless, the statements are valuable, and similar narratives were what led me to make the modification in my aetiological hypotheses which I have mentioned in the text. [Cf. Freud (1908*c*), *RSE*, **9**, 184 f.]

disposition to perversions of every kind is a general and fundamental human characteristic.

Component Drives

Moreover, the effects of seduction do not help to reveal the early history of the sexual drive; they rather confuse our view of it by presenting children prematurely with a sexual object for which the infantile sexual drive at first shows no need. It must, however, be admitted that infantile
[192] sexual life, in spite of the preponderating dominance of erotogenic zones, exhibits components which from the very first involve other people as sexual objects. Such are the drives to scopophilia, exhibitionism and cruelty, which appear in a sense independently of erotogenic zones; these drives do not enter into intimate relations with genital[1] life until later, but are already to be observed in childhood as independent impulses, distinct in the first instance from erotogenic sexual activity. Small children are essentially without shame, and at some periods of their earliest years show an unmistakable satisfaction in exposing their bodies, with special emphasis on the sexual parts. The counterpart of this supposedly perverse inclination, curiosity to see other people's genitals, probably does not become manifest until somewhat later in childhood, when the obstacle set up by a sense of shame has already reached a certain degree of development.[2] Under the influence of seduction the scopophilic perversion can attain great importance in the sexual life of a child. But my researches into the early years of normal people, as well as of neurotic patients, force me to the conclusion that scopophilia can also appear in children as a spontaneous manifestation. Small children whose attention has once been drawn – as a rule by masturbation – to their own genitals usually take the further step without help from outside and develop a lively interest in the genitals of their playmates. Since opportunities for satisfying curiosity of this kind usually occur only in the course of satisfying the two kinds of need for excretion, children of this kind turn into voyeurs, eager spectators of the processes of micturition and defaecation. When repression of these inclinations sets in, the desire to see other people's genitals (whether of their own or the opposite sex) persists as a tormenting compulsion,

1 ['Sexual' in 1905 and 1910.]

2 [In the first (1905) edition this sentence read: 'The counterpart . . . does not join in until later in childhood, when . . .'. In 1910 the word 'probably' was inserted; in 1915 'join in' was replaced with 'become manifest'; and in 1920 'somewhat' was inserted before 'later'. – The subject of exhibitionism in young children had been discussed at some length by Freud in his *Interpretation of Dreams* (1900*a*), Chapter V, Section D (*α*); *RSE*, **4**, 217 f.]

which in some cases of neurosis later affords the strongest driving force [*Triebkraft*] for the formation of symptoms [*Symptombildung*].

The cruel component of the sexual drive develops in childhood even more independently of the sexual activities that are attached to erotogenic zones. Cruelty in general comes easily to the childish nature, since [193] the obstacle that brings the drive to mastery to a halt at another person's pain – namely a capacity for pity – is developed relatively late. The fundamental psychological analysis of this drive has, as we know, not yet been satisfactorily achieved. It may be assumed that the impulse of cruelty arises from the drive to mastery and appears at a period of sexual life at which the genitals have not yet taken over their later role. It then dominates a phase of sexual life which we shall later describe as a pregenital organization.[1] Children who distinguish themselves by special cruelty towards animals and playmates usually give rise to a just suspicion of an intense and precocious sexual activity arising from erotogenic zones; and, though all the sexual drives may display simultaneous precocity, *erotogenic* sexual activity seems, nevertheless, to be the primary one. The absence of the barrier of pity brings with it a danger that the connection between the cruel and the erotogenic drives, thus established in childhood, may prove unbreakable in later life. Ever since Jean-Jacques Rousseau's *Confessions*, it has been well known to all educationalists that the painful stimulation of the skin of the buttocks is one of the erotogenic roots of the *passive* drive to cruelty (masochism). The conclusion has rightly been drawn by them that corporal punishment, which is usually applied to this part of the body, should not be inflicted upon any children whose libido is liable to be forced into collateral channels by the later demands of cultural education.[2]

1 [The last two sentences were given their present form in 1915. In 1905 and 1910 they read as follows: 'It may be assumed that the impulses of cruelty arise from sources which are in fact independent of sexuality, but may become united with it at an early stage owing to an anastomosis [cross-connection] near their points of origin. Observation teaches us, however, that sexual development and the development of the drive to scopophilia and cruelty are subject to mutual influences which limit this presumed independence of the two sets of drives.']

2 [*Footnote added* 1910:] When the account which I have given above of infantile sexuality was first published in 1905, it was founded for the most part on the results of psychoanalytic research upon adults. At that time it was impossible to make full use of direct observation on children: only isolated hints and some valuable pieces of confirmation came from that source. Since then it has become possible to gain direct insight into infantile psychosexuality by the analysis of some cases of neurotic illness during the early years of childhood. It is gratifying to be able to report that direct observation has fully confirmed the conclusions arrived at by psychoanalysis – which is incidentally good evidence of the trustworthiness of that method of research. In addition to this, the 'Analysis of a Phobia in a Five-Year-Old Boy' (1909*b*) has taught us much that is new for which we have not been prepared by psychoanalysis: for instance, the fact that sexual symbolism – the representation of what is sexual by nonsexual objects and relations – extends back into the first years of possession of the power of speech. I was further made aware of a defect in the account I have given in the text, which, in the interests of lucidity, describes the conceptual distinction

[5] THE SEXUAL RESEARCHES OF CHILDHOOD[1]

The Drive to Knowledge

[194] At about the same time as the sexual life of children reaches its first peak, between the ages of three and five, they also begin to show signs of the activity which may be ascribed to the drive to knowledge or research [*Wiss- oder Forschertrieb*]. This drive cannot be counted among the elementary drive components, nor can it be classed as exclusively belonging to sexuality. Its activity corresponds on the one hand to a sublimated manner of obtaining mastery, while on the other hand it makes use of the energy of scopophilia. Its relations to sexual life, however, are of particular importance, since we have learnt from psychoanalysis that the drive to knowledge in children is attracted unexpectedly early and intensively to sexual problems and is in fact possibly first aroused by them.

The Riddle of the Sphinx

It is not by theoretical interests but by practical ones that activities of research are set going in children. The threat to the bases of a child's [195] existence offered by the discovery or the suspicion of the arrival of a new baby and the fear that he may, as a result of it, cease to be cared for and loved make him thoughtful and clear-sighted. And this history of the drive's origin is in line with the fact that the first problem with which it deals is not the question of the distinction between the sexes but the riddle of where babies come from.[2] (This, in a distorted form which can easily be rectified, is the same riddle that was propounded by the Theban Sphinx.) On the contrary, the existence of two sexes does not to begin with arouse any difficulties or doubts in children. It is self-evident to a male child that a genital like his own is to be attributed to everyone he knows, and he cannot make its absence tally with his picture of these other people.

between the two phases of auto-erotism and object love as though it were also a separation in time. But the analyses that I have just mentioned, as well as the findings of Bell quoted on p. 154 *n.* 2 above, show that children between the ages of three and five are capable of very clear object choice, accompanied by strong affects. – [In 1910 only, this footnote continued as follows: 'Another addition to our knowledge of infantile sexual life which has not yet been mentioned in the text relates to the sexual researches of children, to the theories to which children are led by them (cf. my paper on the subject, 1908*c*), to the important bearing of these theories upon later neuroses, to the outcome of these infantile researches and to their relation to the development of children's intellectual powers.']

1 [The whole of this section on the sexual researches of children first appeared in 1915.]

2 [In a later work, Freud (1925*j*), *RSE*, **19**, corrected this statement, saying that it is not true of girls, and not always true of boys.]

Castration Complex and Penis Envy

This conviction is energetically maintained by boys, is obstinately defended against the contradictions which soon result from observation, and is only abandoned after severe internal struggles (the castration complex). The substitutes for this penis which they feel is missing in women play a great part in determining the form taken by many perversions.[1]

The assumption that all human beings have the same (male) form of genital is the first of the many remarkable and momentous sexual theories of children. It is of little use to a child that the science of biology justifies his prejudice and has been obliged to recognize the female clitoris as a true substitute for the penis.

Little girls do not resort to denial of this kind when they see that boys' genitals are formed differently from their own. They are ready to recognize them immediately and are overcome by envy for the penis – an envy culminating in the wish, which is so important in its consequences, to be boys themselves.

Theories of Birth

Many people can remember clearly what an intense interest they took [196]
during the prepubertal period in the question of where babies come from. The anatomical answers to the question were at the time very various: babies come out of the breast, or are cut out of the body, or the navel opens to let them through.[2] Outside analysis, there are very seldom memories of any similar researches having been carried out in the *early* years of childhood. These earlier researches fell victim to repression long since, but all their findings were of a uniform nature: people get babies by eating some particular thing (as they do in fairy tales) and babies are born through the bowel like a discharge of faeces. These infantile theories remind us of conditions that exist in the animal kingdom – and especially of the cloaca in types of animals lower than mammals.

1 [*Footnote added* 1920:] We are justified in speaking of a castration complex in women as well. Both male and female children form a theory that women no less than men originally had a penis, but that they have lost it by castration. The conviction which is finally reached by males that women have no penis often leads them to an enduringly low opinion of the other sex.

2 [*Footnote added* 1924:] In these later years of childhood there is a great wealth of sexual theories, of which only a few examples are given in the text.

Sadistic View of Sexual Intercourse

If children at this early age witness sexual intercourse between adults – for which an opportunity is provided by the conviction of grown-up people that small children cannot understand anything sexual – they inevitably regard the sexual act as a sort of ill-treatment or act of subjugation: they view it, that is, in a sadistic sense. Psychoanalysis also shows us that an impression of this kind in early childhood contributes a great deal towards a predisposition to a subsequent sadistic displacement of the sexual aim. Furthermore, children are much concerned with the problem of what sexual intercourse – or, as they put it, being married – consists in: and they usually seek a solution to the mystery in some common activity concerned with the function of micturition or defaecation.

Typical Failure of Infantile Sexual Researches

We can say in general of the sexual theories of children that they are reflections of their own sexual constitution, and that in spite of their grotesque errors the theories show more understanding of sexual processes than one would have given their creators credit for. Children also
[197] perceive the alterations that take place in their mother owing to pregnancy and are able to interpret them correctly. The fable of the stork is often told to an audience that receives it with deep, though mostly silent, mistrust. There are, however, two elements that remain undiscovered by the sexual researches of children: the fertilizing role of semen and the existence of the female sexual orifice – the same elements, incidentally, in which the infantile organization is itself undeveloped. It therefore follows that the efforts of the childish investigator are habitually fruitless, and end in a renunciation which not infrequently leaves behind it a permanent injury to the drive to knowledge. The sexual researches of these early years of childhood are always carried out in solitude. They constitute a first step towards taking an independent attitude in the world, and imply a high degree of alienation of the child from the people in his environment who formerly enjoyed his complete confidence.

[6] THE PHASES OF DEVELOPMENT OF THE SEXUAL ORGANIZATION[1]

The characteristics of infantile sexual life which we have hitherto emphasized are the facts that it is essentially auto-erotic (i.e. that it finds

1 [The whole of this section, too, first appeared in 1915. The concept of a 'pregenital organization' of sexual life seems to have been first introduced by Freud in his paper on 'The

its object in the infant's own body) and that its individual component drives are upon the whole disconnected and independent of one another in their search for pleasure. The final outcome of sexual development lies in what is known as the normal sexual life of the adult, in which the pursuit of pleasure comes under the sway of the reproductive function and in which the component drives, under the primacy of a single erotogenic zone, form a firm organization directed towards a sexual aim attached to some extraneous sexual object.

Pregenital Organizations

The study, with the help of psychoanalysis, of the inhibitions and disturbances of this process of development enables us to recognize abortive beginnings and preliminary stages of a firm organization of the component drives such as this – preliminary stages which themselves [198]
constitute a sexual regime of a sort. These phases of sexual organization are normally passed through smoothly, without giving more than a hint of their existence. It is only in pathological cases that they become active and recognizable to superficial observation.

We shall give the name of 'pregenital' to organizations of sexual life in which the genital zones have not yet taken over their predominant part. We have hitherto identified two such organizations, which almost seem as though they were harking back to early animal forms of life.

The first of these is the *oral* or, as it might be called, *cannibalistic* pregenital sexual organization. Here sexual activity has not yet been separated from the ingestion of food; nor are opposite currents within the activity differentiated. The *object* of both activities is the same; the sexual *aim* consists in the *incorporation* of the object – the prototype of a process which, in the form of *identification*, is later to play such an important psychological part. A relic of this constructed phase of organization, which is forced upon our notice by pathology, may be seen in thumbsucking, in which the sexual activity, detached from the nutritive activity, has substituted for the extraneous object one situated in the subject's own body.[1]

A second pregenital phase is that of the *sadistic-anal* organization.

Disposition to Obsessional Neurosis' (1913*i*), *RSE*, **12**, 316 f., which, however, deals only with the sadistic-anal organization. The oral organization was apparently recognized as such for the first time in the present passage.]

1 [*Footnote added* 1920:] For remnants of this phase in adult neurotics, cf. Abraham (1916). [*Added* 1924:] In another, later work (1924) the same writer has divided both this oral phase, and also the later sadistic-anal one, into two subdivisions, which are characterized by differing attitudes towards the object.

Here the opposition between two currents, which runs through all sexual life, is already developed: they cannot yet, however, be described as 'masculine' and 'feminine', but only as 'active' and 'passive'. The *activity* is put into operation by the drive to mastery through the agency of the somatic musculature; the organ which, more than any other, represents the *passive* sexual aim is the erotogenic mucous membrane of the anus. Both of these currents have objects, which, however, are not identical. Alongside these, other component drives operate in an auto-erotic
[199] manner. In this phase, therefore, sexual polarity and an extraneous object are already observable. But organization and subordination to the reproductive function are still absent.[1]

Ambivalence

This form of sexual organization can persist throughout life and can permanently attract a large portion of sexual activity to itself. The predominance in it of sadism and the cloacal part played by the anal zone give it a quite peculiarly archaic colouring. It is further characterized by the fact that in it the opposing pairs of drives are developed to an approximately equal extent, a state of affairs described by Bleuler's happily chosen term 'ambivalence'.

The assumption of the existence of pregenital organizations of sexual life is based on the analysis of the neuroses, and without a knowledge of them can scarcely be appreciated. Further analytic investigation may be expected to provide us with far more information on the structure and development of the normal sexual function.

In order to complete our picture of infantile sexual life, we must also suppose that the choice of an object, such as we have shown to be characteristic of the pubertal phase of development, has already frequently or habitually been effected during the years of childhood: that is to say, the whole of the sexual currents have become directed towards a single person in relation to whom they seek to achieve their aims. This then is the closest approximation possible in childhood to the final form taken by sexual life after puberty. The only difference lies in the fact that in childhood the combination of the component drives and their subordination under the primacy of the genitals have been effected only very incompletely or not at all. Thus the establishment of that primacy in the

1 [*Footnote added* 1924:] Abraham, in the paper last quoted (1924), points out that the anus is developed from the embryonic blastopore – a fact which seems like a biological prototype of psychosexual development.

service of reproduction is the last phase through which the organization of sexuality passes.[1]

Diphasic Choice of Object

It may be regarded as typical of the choice of an object that the process is [200] diphasic, that is, that it occurs in two waves. The first of these begins between the ages of two[2] and five, and is brought to a halt or to a retreat by the latency period; it is characterized by the infantile nature of the sexual aims. The second wave sets in with puberty and determines the final outcome of sexual life.

Although the diphasic nature of object choice comes down in essentials to no more than the operation of the latency period, it is of the highest importance in regard to disturbances of that final outcome. The resultants of infantile object choice are carried over into the later period. They either persist as such or are revived at the actual time of puberty. But as a consequence of the repression which has developed between the two phases they prove unutilizable. Their sexual aims have become mitigated and they now represent what may be described as the 'affectionate current' of sexual life. Only psychoanalytic investigation can show that behind this affection, admiration and respect there lie concealed the old sexual longings of the infantile component drives which have now become unserviceable. The object choice of the pubertal period is obliged to dispense with the objects of childhood and to start afresh as a 'sensual current'. Should these two currents fail to converge, the result is often that one of the ideals of sexual life, the focusing of all desires upon a single object, will be unattainable.[3]

[7] THE SOURCES OF INFANTILE SEXUALITY

Our efforts to trace the origins of the sexual drive have shown us so far that sexual excitation arises (*a*) as a reproduction of a satisfaction experienced in connection with other organic processes, (*b*) through

1 [*Footnote added* 1924:] At a later date (1923), I myself modified this account by inserting a third phase in the development of childhood, subsequent to the two pregenital organizations. This phase, which already deserves to be described as genital, presents a sexual object and some degree of convergence of the sexual impulses upon that object; but it is differentiated from the final organization of sexual maturity in one essential respect. For it knows only one kind of genital: the male one. For that reason I have named it the 'phallic' stage of organization. (Freud, 1923*e* [where almost the whole of this paragraph of the text is quoted; *RSE*, **19**, 131–2].) According to Abraham [1924], it has a biological prototype in the embryo's undifferentiated genital disposition, which is the same for both sexes.

2 [In 1915 this figure was 'three'; it was altered to 'two' in 1920. Cf. also the end of footnote 2, p. 196 below.]

3 [The two currents were discussed at length in the second of Freud's 'Contributions to the Psychology of Love' (1912*d*), *RSE*, **11**, 168–74.]

appropriate peripheral stimulation of erotogenic zones and (*c*) as an
[201] expression of certain 'drives' (such as the scopophilic drive and the drive to cruelty) of which the origin is not yet completely intelligible. Psychoanalytic investigation, reaching back into childhood from a later time, and contemporary observation of children combine to indicate to us still other regularly active sources of sexual excitation. The direct observation of children has the disadvantage of working upon data which are easily misunderstandable; psychoanalysis is made difficult by the fact that it can only reach its data, as well as its conclusions, after long detours. But by cooperation the two methods can attain a satisfactory degree of certainty in their findings.

We have already discovered in examining the erotogenic zones that these regions of the skin merely show a special intensification of a kind of susceptibility to stimulus which is possessed in a certain degree by the whole cutaneous surface. We shall therefore not be surprised to find that very definite erotogenic effects are to be ascribed to certain kinds of general stimulation of the skin. Among these we may especially mention thermal stimuli, whose importance may help us to understand the therapeutic effects of warm baths.

Mechanical Excitations

At this point we must also mention the production of sexual excitation by rhythmic mechanical agitation of the body. Stimuli of this kind operate in three different ways: on the sensory apparatus of the vestibular nerves, on the skin, and on the deeper parts (e.g. the muscles and articular structures). The existence of these pleasurable sensations – and it is worth emphasizing the fact that in this connection the concepts of 'sexual excitation' and 'satisfaction' can to a great extent be used without distinction, a circumstance which we must later endeavour to explain [p. 188 below] – the existence, then, of these pleasurable sensations, caused by forms of mechanical agitation of the body, is confirmed by the fact that children are so fond of games of passive movement, such as swinging and being thrown up into the air, and insist on such games
[202] being incessantly repeated.[1] It is well known that rocking is habitually used to induce sleep in restless children. The shaking produced by driving in carriages and later by railway travel exercises such a fascinating effect upon older children that every boy, at any rate, has at one time or other in his life wanted to be an engine driver or a coachman. It is a puzzling fact that boys take such an extraordinarily intense interest in

1 Some people can remember that in swinging they felt the impact of moving air upon their genitals as an immediate sexual pleasure. [A specific instance of this is quoted in a footnote to a passage in *The Interpretation of Dreams* (1900*a*, in Chapter V) in which this whole topic is discussed (*RSE*, **4**, 241 *n.* 3).]

things connected with railways, and, at the age at which the production of phantasies is most active (shortly before puberty), use those things as the nucleus of a symbolism that is peculiarly sexual. A compulsive link of this kind between railway travel and sexuality is clearly derived from the pleasurable character of the sensations of movement. In the event of repression, which turns so many childish preferences into their opposite, these same individuals, when they are adolescents or adults, will react to rocking or swinging with a feeling of nausea, will be terribly exhausted by a railway journey, or will be subject to attacks of anxiety on the journey and will protect themselves against a repetition of the painful experience by railway anxiety.

Here again we must mention the fact, which is not yet understood, that the combination of fright and mechanical agitation produces the severe, hysteriform, traumatic neurosis. It may at least be assumed that these influences, which, when they are of small intensity, become sources of sexual excitation, lead to a profound disorder in the sexual mechanism or chemistry[1] if they operate with exaggerated force.

Muscular Activity

We are all familiar with the fact that children feel a need for a large amount of active muscular exercise and derive extraordinary pleasure from satisfying it. Whether this pleasure has any connection with sexuality, whether it itself comprises sexual satisfaction or whether it can become the occasion of sexual excitation – all of this is open to critical questioning, which may indeed also be directed against the view maintained in the previous paragraphs that the pleasure derived from sensations of *passive* movement is of a sexual nature or may produce sexual excitation. It is, however, a fact that a number of people report that they experienced the first signs of excitement in their genitals while they were romping or wrestling with playmates – a situation in which, [203]
apart from general muscular exertion, there is a large amount of contact with the skin of the opponent. An inclination to physical struggles with some one particular person, just as in later years an inclination to *verbal* disputes,[2] is a convincing sign that object choice has fallen on him. One of the roots of the sadistic drive would seem to lie in the encouragement of sexual excitation by muscular activity. In many people the infantile connection between romping and sexual excitation is among the determinants of the direction subsequently taken by their sexual drive.[3]

1 [The last two words were added in 1924.]

2 'Was sich liebt, das neckt sich.' [Lovers' quarrels are proverbial.]

3 [*Footnote added* 1910:] The analysis of cases of neurotic abasia and agoraphobia removes all doubt as to the sexual nature of pleasure in movement. Modern education, as we know, makes

Affective Processes

The further sources of sexual excitation in children are open to less doubt. It is easy to establish, whether by contemporary observation or by subsequent research, that all comparatively intense affective processes, including even terrifying ones, trench upon sexuality – a fact which may incidentally help to explain the pathogenic effect of emotions of that kind. In schoolchildren dread [*Angst*][T] of going in for an examination or tension over a difficult piece of work can be important not only in affecting the child's relations at school but also in bringing about an irruption of sexual manifestations. For quite often in such circumstances a stimulus may be felt which urges the child to touch his genitals, or something may take place akin to a nocturnal emission with all its bewildering consequences. The behaviour of children at school, which confronts a teacher with plenty of puzzles, deserves in general to be brought into relation with their budding sexuality. The sexually exciting effect of many emotions which are in themselves unpleasurable, such as feelings of apprehension, fright or horror [*Ängstigens*, *Schauderns*, *Grausens*], persists in a great number of people throughout their adult life. There is no doubt that this is the explanation of why so many people seek opportunities for sensations of this kind, subject to the proviso that the seriousness of the unpleasurable feeling is damped
[204] down by certain qualifying facts, such as its occurring in an imaginary world, in a book or in a play.

If we assume that a similar erotogenic effect attaches even to intensely painful feelings, especially when the pain is toned down or kept at a distance by some accompanying condition, we should here have one of the main roots of the masochistic-sadistic drive, into whose numerous complexities we are very gradually gaining some insight.[1]

Intellectual Work

Finally, it is an unmistakable fact that concentration of the attention upon an intellectual task and intellectual strain in general produce a concomitant sexual excitation in many young people as well as adults. This is no doubt the only justifiable basis for what is in other respects the questionable practice of ascribing nervous disorders to intellectual 'overwork'.[2]

great use of games in order to divert young people from sexual activity. It would be more correct to say that in these young people it replaces sexual enjoyment with pleasure in movement – and forces sexual activity back to one of its auto-erotic components.

1 [*Footnote added* 1924:] I am here referring to what is known as 'erotogenic' masochism. [See footnote 2, p. 141 above.]

2 [Some earlier remarks by Freud on this subject can be found in his first paper on 'Sexuality in the Aetiology of the Neuroses' (1898*a*), *RSE*, **3**, 267, and some later ones in a footnote to Section III of 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 204 *n.* 2.]

If we now cast our eyes over the tentative suggestions which I have made as to the sources of infantile sexual excitation, though I have not described them completely nor enumerated them fully, the following conclusions emerge with more or less certainty. It seems that the fullest provisions are made for setting in motion the process of sexual excitation – a process the nature of which has, it must be confessed, become highly obscure to us. The setting in motion of this process is first and foremost provided for in a more or less direct fashion by the excitations of the sensory surfaces – the skin and the sense organs – and, most directly of all, by the operation of stimuli on certain areas known as erotogenic zones. The decisive element in these sources of sexual excitation is no doubt the *quality* of the stimuli, though the factor of intensity, in the case of pain, is not a matter of complete indifference. But apart from these sources there are present in the organism contrivances which bring it about that in the case of a great number of internal processes sexual excitation arises as a concomitant effect, as soon as the intensity of those processes passes beyond certain quantitative limits. [205]
What we have called the component drives of sexuality are either derived directly from these internal sources or are composed of elements both from those sources and from the erotogenic zones. It may well be that nothing of considerable importance can occur in the organism without contributing some component to the excitation of the sexual drive.[1]

It does not seem to me possible at present to state these general conclusions with any greater clarity or certainty. For this I think two factors are responsible: first, the novelty of the whole method of approach to the subject, and secondly, the fact that the whole nature of sexual excitation is completely unknown to us. Nevertheless, I am tempted to make two observations which promise to open out wide future prospects:

(*a*) *Varieties of Sexual Constitution*

Just as we saw previously [p. 152 f. above] that it was possible to derive a multiplicity of innate sexual constitutions from variety in the development of the erotogenic zones, so we can now make a similar attempt by including the *indirect* sources of sexual excitation. It may be assumed that, although contributions are made from these sources in the case of everyone, they are not in all cases of equal strength, and that further help

1 [Freud quoted this passage in his paper on 'The Economic Problem of Masochism' (1924*c*), *RSE*, **19**, 154.]

towards the differentiation of sexual constitutions may be found in the varying development of the individual sources of sexual excitation.[1]

(*b*) *Pathways of Mutual Influence*

If we now drop the figurative expression that we have so long adopted in speaking of the 'sources' of sexual excitation, we are led to the suspicion that all the connecting pathways that lead from other functions to sexuality must also be traversable in the reverse direction. If, for instance, the common possession of the labial zone by the two functions is the reason why sexual satisfaction arises during the taking of nourishment,
[206] then the same factor also enables us to understand why there should be disorders of nutrition if the erotogenic functions of the common zone are disturbed. Or again, if we know that concentration of attention may give rise to sexual excitation, it seems plausible to assume that by making use of the same path, but in a contrary direction, the condition of sexual excitation may influence the possibility of directing the attention. A good portion of the symptomatology of the neuroses, which I have traced to disturbances of the sexual processes, is expressed in disturbances of other, nonsexual, somatic functions; and this circumstance, which has hitherto been unintelligible, becomes less puzzling if it is only the counterpart of the influences which bring about the production of sexual excitation.[2]

The same pathways, however, along which sexual disturbances trench upon the other somatic functions must also perform another important function in normal health. They must serve as paths for the attraction of sexual drive forces to aims that are other than sexual, that is to say, for the sublimation of sexuality. But we must end with a confession that very little is as yet known with certainty of these pathways, though they certainly exist and can probably be traversed in both directions.[3]

1 [*Footnote added* 1920:] An inevitable consequence of these considerations is that we must regard each individual as possessing an oral erotism, an anal erotism, a urethral erotism, etc., and that the existence of mental complexes corresponding to these implies no judgement of abnormality or neurosis. The differences separating the normal from the abnormal can lie only in the relative strength of the individual components of the sexual drive and in the use to which they are put in the course of development.

2 [Freud took up this point again, with special reference to disorders of vision, in his paper 'The Psychoanalytic View of Psychogenic Disturbance of Vision' (1910*i*), *RSE*, **11**, 205–6.]

3 [In a letter to Freud of May 14, 1911, Abraham asked for a few words of comment on this paragraph. Freud replied on May 18, 1911: 'The passage in the *Theory of Sexuality* was bound to turn out in an oracular fashion because no clear idea lay behind it, only a construction. There are pathways of an unknown nature, along which the sexual processes produce an effect on digestion, haematopoiesis, etc. The disturbing influences from sexuality travel by these pathways and thus, normally, the beneficial and otherwise utilizable affluxes probably do so, too.' (Freud, 1965*a*).]

III

THE TRANSFORMATIONS OF PUBERTY

With the arrival of puberty, changes set in which are destined to give [207]
infantile sexual life its final, normal shape. The sexual drive has hitherto been predominantly auto-erotic; it now finds a sexual object. Its activity has hitherto been derived from a number of separate drives and erotogenic zones, which, independently of one another, have pursued a certain sort of pleasure as their sole sexual aim. Now, however, a new sexual aim appears, and all the component drives combine to attain it, while the erotogenic zones become subordinated to the primacy of the genital zone.[1] Since the new sexual aim assigns very different functions to the two sexes, their sexual development now diverges greatly. That of males is the more straightforward and the more understandable, while that of females actually enters upon a kind of involution. A normal sexual life is only assured by an exact convergence of the two currents directed towards the sexual object and the sexual aim, the affectionate current and the sensual one.[2] (The former, the affectionate current, comprises what remains over of the infantile efflorescence of sexuality.)[3] It is like the completion of a tunnel which has been driven through a hill from both directions.

The new sexual aim in men consists in the discharge of the sexual products. The earlier one, the attainment of pleasure, is by no means alien to it; on the contrary, the highest degree of pleasure is attached to this final act of the sexual process. The sexual drive is now subordinated to the reproductive function; it becomes, so to say, altruistic. If this transformation is to succeed, the original dispositions and all the other characteristics of the drives must be taken into account in the process. Just as on any other occasion on which the organism should by rights [208]

1 [*Footnote added* 1915:] The schematic picture which I have given in the text aims at emphasizing differences. I have already shown on p. 176 f. the extent to which infantile sexuality approximates to the final sexual organization, owing to its choice of object [*added* 1924:] and to the development of the phallic phase.

2 [The last seven words were added in 1915.]

3 [This sentence was added in 1920.]

make new combinations and adjustments leading to complicated mechanisms, here too there are possibilities of pathological disorders if these new arrangements are not carried out. Every pathological disorder of sexual life is rightly to be regarded as an inhibition in development.

[1] THE PRIMACY OF THE GENITAL ZONES AND FORE-PLEASURE

The starting point and the final aim of the process which I have described are clearly visible. The intermediate steps are still in many ways obscure to us. We shall have to leave more than one of them as an unsolved riddle.

The most striking of the processes at puberty has been picked upon as constituting its essence: the manifest growth of the external genitalia. (The latency period of childhood is, on the other hand, characterized by a relative cessation of their growth.) In the meantime the development of the internal genitalia has advanced far enough for them to be able to discharge the sexual products or, as the case may be, to bring about the formation of a new living organism. Thus a highly complicated apparatus has been made ready and awaits the moment of being put into operation.

This apparatus is to be set in motion by stimuli, and observation shows us that stimuli can impinge on it from three directions: from the external world by means of the excitation of the erotogenic zones with which we are already familiar, from the organic interior by ways which we have still to explore, and from mental life, which is itself a storehouse for external impressions and a receiving post for internal excitations. All three kinds of stimuli produce the same effect, namely a condition described as 'sexual excitement', which shows itself by two sorts of indication, mental and somatic. The mental indications consist in a peculiar feeling of tension of an extremely compelling character; and among the numerous somatic ones are first and foremost a number of changes in the genitals, which have the obvious sense of being preparations for the sexual act – the erection of the male organ and the lubrication of the vagina.

Sexual Tension

[209] The fact that sexual excitement possesses the character of tension raises a problem the solution to which is no less difficult than it would be important in helping us to understand the sexual processes. In spite of all the differences of opinion that reign on the subject among psychologists, I must insist that a feeling of tension necessarily involves unpleasure

[*Unlust*][T]. What seems to me decisive is the fact that a feeling of this kind is accompanied by an impulsion to make a change in the psychological situation, that it operates in an urgent way which is wholly alien to the nature of the feeling of pleasure [*Lust*]. If, however, the tension of sexual excitement is counted as an unpleasurable feeling, we are at once brought up against the fact that it is also undoubtedly felt as pleasurable. In every case in which tension is produced by sexual processes it is accompanied by pleasure; even in the preparatory changes in the genitals a feeling of satisfaction of some kind is plainly to be observed. How, then, are this unpleasurable tension and this feeling of pleasure to be reconciled?

Everything relating to the problem of pleasure and unpleasure touches upon one of the sorest spots of present-day psychology. It will be my aim to learn as much as possible from the circumstances of the instance with which we are at present dealing, but I shall avoid any approach to the problem as a whole.[1]

Let us begin by casting a glance at the way in which the erotogenic zones fit themselves into the new arrangement. They have to play an important part in introducing sexual excitation. The eye is perhaps the zone most remote from the sexual object, but it is the one which, in the situation of wooing an object, is liable to be the most frequently stimulated by the particular quality of excitation whose cause, when it occurs in a sexual object, we describe as beauty. (For the same reason the merits of a sexual object are described as 'attractions' [*Reize*].)[2] This stimulation [*Reizung*] is, on the one hand, already accompanied by pleasure, while, on the other hand, it leads to an increase of sexual excitement or produces it if it is not yet present. If the excitation now spreads to another erotogenic zone – to the hand, for instance, through tactile sensations – [210]
the effect is the same: a feeling of pleasure on the one side, which is quickly intensified by pleasure arising from the preparatory changes [in the genitals], and on the other side an increase of sexual tension, which soon passes over into the most obvious unpleasure if it cannot be met by a further accession of pleasure. Another instance will perhaps make this even clearer. If an erotogenic zone in a person who is not sexually excited (e.g. the skin of a woman's breast) is stimulated by touch, the contact produces a pleasurable feeling; but it is at the same time better calculated than anything to arouse a sexual excitation that demands an increase of

1 [*Footnote added* 1924:] I have made an attempt at solving this problem in the first part of my paper on 'The Economic Problem of Masochism' (1924*c*) [*RSE*, **19**, 151 f.].

2 [See footnote 2, p. 139 above.]

pleasure. The problem is how it can come about that an experience of pleasure can give rise to a need for greater pleasure.

The Mechanism of Fore-pleasure

The part played in this by the erotogenic zones, however, is clear. What is true of one of them is true of all. They are all used to provide a certain amount of pleasure by being stimulated in the way appropriate to them. This pleasure then leads to an increase in tension which in its turn is responsible for producing the necessary motor energy for the conclusion of the sexual act. The penultimate stage of that act is once again the appropriate stimulation of an erotogenic zone (the genital zone itself, in the glans penis) by the appropriate object (the mucous membrane of the vagina); and from the pleasure yielded by this excitation the motor energy is obtained, this time by a reflex path, which brings about the discharge of the sexual substances. This last pleasure is the highest in intensity, and its mechanism differs from that of the earlier pleasure. It is brought about entirely by discharge: it is wholly a pleasure of satisfaction and with it the tension of the libido is for the time being extinguished.

This distinction between the one kind of pleasure due to the excitation of erotogenic zones and the other kind due to the discharge of the sexual substances deserves, I think, to be made more concrete by a difference in nomenclature. The former may be suitably described as 'fore-pleasure' in contrast to the 'end-pleasure' or pleasure of satisfaction derived from the sexual act. Fore-pleasure is thus the same pleasure that has already been produced, although on a smaller scale, by the infantile sexual drive;
[211] end-pleasure is something new and is thus probably conditioned by circumstances that do not arise till puberty. The formula for the new function of the erotogenic zones runs therefore: they are used to make possible, through the medium of the fore-pleasure which can be derived from them (as it was during infantile life), the production of the greater pleasure of satisfaction.

I was able recently to throw light upon another instance, in a quite different department of mental life, of a slight feeling of pleasure similarly making possible the attainment of a greater resultant pleasure, and thus operating as an 'incentive bonus'. In the same connection I was also able to go more deeply into the nature of pleasure.[1]

1 See my volume on *Jokes and their Relation to the Unconscious* which appeared in 1905 [in Chapter IV; *RSE*, **8**, 120]. The 'fore-pleasure' attained by the technique of joking is used in order to liberate a greater pleasure derived from the removal of internal inhibitions. [In a later paper, on creative writing (1908*e*), ibid., **9**, 131, Freud attributed a similar mechanism to aesthetic pleasure.]

Dangers of Fore-pleasure

The connection between fore-pleasure and infantile sexual life is, however, made clearer by the pathogenic part which it can come to play. The attainment of the normal sexual aim can clearly be endangered by the mechanism in which fore-pleasure is involved. This danger arises if at any point in the preparatory sexual processes the fore-pleasure turns out to be too great and the element of tension too small. The motive for proceeding further with the sexual process then disappears, the whole path is cut short, and the preparatory act in question takes the place of the normal sexual aim. Experience has shown that the precondition for this damaging event is that the erotogenic zone concerned or the corresponding component drive shall already during childhood have contributed an unusual amount of pleasure. If further factors then come into play, tending to bring about a fixation, a compulsion may easily arise in later life which resists the incorporation of this particular fore-pleasure into a new context. Such is in fact the mechanism of many perversions, which consist in a lingering over the preparatory acts of the sexual process.

This failure of the function of the sexual mechanism owing to fore-pleasure is best avoided if the primacy of the genitals too is adumbrated [212]
in childhood; and indeed things seem actually arranged to bring this about in the second half of childhood (from the age of eight to puberty). During these years the genital zones already behave in much the same way as in maturity; they become the seat of sensations of excitation and of preparatory changes whenever any pleasure is felt from the satisfaction of other erotogenic zones, though this result is still without a purpose – that is to say, contributes nothing to a continuation of the sexual process. Already in childhood, therefore, alongside of the pleasure of satisfaction there is a certain amount of sexual tension, although it is less constant and less in quantity. We can now understand why, in discussing the sources of sexuality, we were equally justified in saying of a given process that it was sexually satisfying or sexually exciting. [See p. 178 above.] It will be noticed that in the course of our enquiry we began by exaggerating the distinction between infantile and mature sexual life, and that we are now setting this right. Not only the deviations from normal sexual life but its normal form as well are determined by the infantile manifestations of sexuality.

[2] THE PROBLEM OF SEXUAL EXCITATION

We remain in complete ignorance both of the origin and of the nature of the sexual tension which arises simultaneously with the pleasure when erotogenic zones are satisfied.[1] The most obvious explanation, that this tension arises in some way out of the pleasure itself, is not only extremely improbable in itself but becomes untenable when we consider that in connection with the greatest pleasure of all, that which accompanies the discharge of the sexual products, no tension is produced, but on the contrary all tension is removed. Thus pleasure and sexual tension can only be connected in an indirect manner.

Part Played by the Sexual Substances

[213] Apart from the fact that normally it is only the discharge of the sexual substances that brings sexual excitation to an end, there are other points of contact between sexual tension and the sexual products. In the case of a man living an abstinent life, the sexual apparatus, at varying intervals, which, however, are not ungoverned by rules, discharges the sexual substances during the night, to the accompaniment of a pleasurable feeling and in the course of a dream which hallucinates a sexual act. And in regard to this process (nocturnal emission) it is difficult to avoid the conclusion that the sexual tension, which succeeds in making use of the shortcut of hallucination as a substitute for the act itself, is a function of the accumulation of semen in the vesicles containing the sexual products. Our experience in connection with the exhaustibility of the sexual mechanism argues in the same sense. If the store of semen is exhausted, not only is it impossible to carry out the sexual act, but the susceptibility of the erotogenic zones to stimulus ceases, and their appropriate excitation no longer gives rise to any pleasure. We thus learn incidentally that a certain degree of sexual tension is required even for the excitability of the erotogenic zones.

This would seem to lead to what is, if I am not mistaken, the fairly widespread hypothesis that the accumulation of the sexual substances creates and maintains sexual tension; the pressure of these products upon the walls of the vesicles containing them might be supposed to act as a stimulus upon a spinal centre, the condition of which would be

1 It is a highly instructive fact that the German language in its use of the word '*Lust*' takes into account the part played by the preparatory sexual excitations which, as has been explained above, simultaneously produce an element of satisfaction and a contribution to sexual tension. '*Lust*' has two meanings, and is used to describe the sensation of sexual tension ('*Ich habe Lust*' = 'I should like to', 'I feel an impulse to') as well as the feeling of satisfaction. [Cf. footnote 2, p. 121 above, and *RSE*, **24**, 74–5.]

perceived by higher centres and would then give rise in consciousness to the familiar sensation of tension. If the excitation of the erotogenic zones increases sexual tension, this could only come about on the supposition that the zones in question are in an anatomical connection that has already been laid down with these centres, that they increase the tonus of the excitation in them, and, if the sexual tension is sufficient, set the sexual act in motion or, if it is insufficient, stimulate the production of the sexual substances.[1]

The weakness of this theory, which we find accepted, for instance, in Krafft-Ebing's account of the sexual processes, lies in the fact that, having been designed to account for the sexual activity of adult males, it takes too little account of three sets of conditions which it should also be able to explain. These are the conditions in children, in females and in castrated males. In none of these three cases can there be any question of an accumulation of sexual products in the same sense as in males, and this makes a smooth application of the theory difficult. Nevertheless, it may at once be admitted that it is possible to find means by which the theory may be made to cover these cases as well. In any case we are warned not to lay more weight on the factor of the accumulation of the sexual products than it is able to bear. [214]

Importance of the Internal Sexual Organs

Observations on castrated males seem to show that sexual excitation can occur to a considerable degree independently of the production of the sexual substances. The operation of castration occasionally fails to bring about a limitation of libido, although such limitation, which provides the motive for the operation, is the usual outcome. Moreover, it has long been known that diseases which abolish the production of the masculine sex cells leave the patient, though he is now sterile, with his libido and potency undamaged.[2] It is therefore by no means as astonishing as Rieger [1900] represents it to be that the loss of the masculine sex glands in an adult may have no further effect upon his mental behaviour.[3] It is true that if castration is performed at a tender age, before

1 [This hypothesis had been discussed by Freud earlier: in Section III of his first paper on anxiety neurosis (1895*b*), *RSE*, **3**, 96–7.]

2 [This sentence was added in 1920.]

3 [The following sentence occurs at this point in editions before 1920, when it was omitted: 'For the sex glands do not constitute sexuality, and the observations on castrated males merely confirm what had been shown long before by removal of the ovaries – namely that it is impossible to obliterate the sexual characters by removing the sex glands.' Before 1920, too, the second half of the next sentence began: 'but it seems that what is in question here is not the actual loss of the sex glands but an inhibition . . .']

puberty, it approximates in its effect to the aim of obliterating the sexual characters; but here too it is possible that what is in question is, besides the actual loss of the sex glands, an inhibition (connected with that loss) in the development of other factors.

Chemical Theory

[215] Experiments in the removal of the sex glands (testes and ovaries) of animals, and in the grafting into vertebrates of sex glands from other individuals of the opposite sex,[1] have at last thrown a partial light on the origin of sexual excitation, and have at the same time still further reduced the significance of a possible accumulation of cellular sexual products. It has become experimentally possible (E. Steinach) to transform a male into a female, and conversely a female into a male. In this process the psychosexual behaviour of the animal alters in accordance with the somatic sexual characters and simultaneously with them. It seems, however, that this sex-determining influence is not an attribute of that part of the sex glands which gives rise to the specific sex cells (spermatozoa and ovum) but of their interstitial tissue, upon which special emphasis is laid by being described in the literature as the 'puberty gland'. It is quite possible that further investigation will show that this puberty gland has normally a hermaphrodite disposition. If this were so, the theory of the bisexuality of the higher animals would be given anatomical foundation. It is already probable that the puberty gland is not the only organ concerned with the production of sexual excitation and sexual characters. In any case, what we already know of the part played by the thyroid gland in sexuality fits in with this new biological discovery. It seems probable, then, that special chemical substances are produced in the interstitial portion of the sex glands; these are then taken up in the blood stream and cause particular parts of the central nervous system to be charged with sexual tension. (We are already familiar with the fact that other toxic substances, introduced into the body from outside, can bring about a similar transformation of a toxic condition into a stimulus acting on a particular organ.) The question of how sexual excitation arises from the stimulation of erotogenic zones, when the central apparatus has been previously charged, and the question of what interplay arises in the course of these sexual processes between the effects of purely toxic stimuli and of physiological ones – none of this can be treated, even hypothetically, in the present state of our knowledge. It must suffice us to hold firmly to what is essential in this view of

1 Cf. Lipschütz's work [1919], quoted on p. 157 *n.* 2.

the sexual processes: the assumption that substances of a peculiar kind [216]
arise from the sexual metabolism.[1] For this apparently arbitrary supposition is supported by a fact which has received little attention but deserves the closest consideration. The neuroses, which can be derived only from disturbances of sexual life, show the greatest clinical similarity to the phenomena of intoxication and abstinence that arise from the habitual use of toxic, pleasure-producing substances (alkaloids [e.g. cocaine]).

[3] THE LIBIDO THEORY[2]

The conceptual scaffolding which we have set up to help us in dealing [217]
with the psychical manifestations of sexual life tallies well with these hypotheses as to the chemical basis of sexual excitation. We have defined the concept of libido as a quantitatively variable force which could serve as a measure of processes and transformations occurring in the field of

1 [The whole of this paragraph as far as this point dates in its present form from 1920. In the first edition (1905) and the two subsequent ones the following passage appears in its place: 'The truth is that we can give no information on the nature of sexual excitation, especially since (having found that the importance of the sex glands in this respect has been overestimated) we are in the dark as to the organ or organs to which sexuality is attached. After the surprising discoveries of the important part played by the thyroid gland in sexuality, it is reasonable to suspect that we are still ignorant of the essential factors of sexuality. Anyone who feels the need of a provisional hypothesis to fill this wide gap in our knowledge may well take as his starting point the powerful substances which have been found to be present in the thyroid gland and may proceed along some such lines as the following. It may be supposed that, as a result of an appropriate stimulation of erotogenic zones, or in other circumstances that are accompanied by an onset of sexual excitation, some substance that is disseminated generally throughout the organism becomes decomposed and the products of its decomposition give rise to a specific stimulus which acts on the reproductive organs or upon a spinal centre related to them. (We are already familiar with the fact that other toxic substances, introduced into the body from outside, can bring about a similar transformation of a toxic condition into a stimulus acting on a particular organ.) The question of what interplay arises in the course of the sexual processes between the effects of purely toxic stimuli and of physiological ones cannot be treated, even hypothetically, in the present state of our knowledge. I may add that I attach no importance to this particular hypothesis and should be ready to abandon it at once in favour of another, provided that its fundamental nature remained unchanged – that is, the emphasis which it lays upon sexual chemistry.' – It is worth remarking how small a modification was made necessary in Freud's hypothesis by the discovery of the sex hormones, which, indeed, he had anticipated not merely in 1905 but at least as early as in 1896, as may be seen from his two letters to Fliess, of March 1 and April 2 of that year (Freud, 1950*a*, Letters 42 and 44). He further insisted upon the importance of the chemical factor in his second paper on the part played by sexuality in the neuroses, published at about the same time as the first edition of the *Three Essays* (1906*a*, this volume, p. 288). Cf. also some remarks in the 'Dora' case (1905*e* [1901]) and in Section III of the paper on 'Female Sexuality' (1931*b*), *RSE*, **21**, 228 f. Curiously, especially in light of the theory described in the next section to the effect that libido cathects the ego as its first *object*, the discovery that chemical substances produced in the sex glands are taken up in the blood stream and cause particular parts of the central nervous system to be charged with sexual tension did not prompt Freud to question his view of the erotogenic zones as the *sources* of libidinal drive. Cf. the second paragraph on p. 150 above.]

2 [This whole section, except for its last paragraph, dates from 1915. It is largely based on Freud's paper on narcissism (1914*c*), *RSE*, **14**, 63 ff.]

sexual excitation. We distinguish this libido in respect of its special origin from the energy which must be supposed to underlie mental processes in general, and we thus also attribute a *qualitative* character to it. In thus distinguishing between libidinal and other forms of psychical energy we are giving expression to the presumption that the sexual processes occurring in the organism are distinguished from the nutritive processes by a special chemistry. The analysis of the perversions and psychoneuroses has shown us that this sexual excitation is derived not from the so-called sexual parts alone, but from all the bodily organs. We thus reach the idea of a quantity of libido, to the mental representation of which we give the name of 'ego libido', and whose production, increase or diminution, distribution and displacement should afford us possibilities for explaining the psychosexual phenomena observed.

This ego libido is, however, only conveniently accessible to analytic study when it has been put to the use of cathecting [*Besetzung*] sexual objects, that is, when it has become 'object libido'. We can then perceive it concentrating upon objects,[1] becoming fixated upon them or abandoning them, moving from one object to another and, from these situations, directing the subject's sexual activity, which leads to the satisfaction, that is, to the partial and temporary extinction, of the libido. The psychoanalysis of what are termed transference neuroses (hysteria and obsessional neurosis) affords us a clear insight at this point.

We can follow the object libido through still further vicissitudes.
[218] When it is withdrawn from objects, it is held in suspense in peculiar conditions of tension and is finally drawn back into the ego, so that it becomes ego libido once again. In contrast to object libido, we also describe ego libido as 'narcissistic' libido. From the vantage-point of psychoanalysis we can look across a frontier, which we may not pass, at the activities of narcissistic libido, and may form some idea of the relation between it and object libido.[2] Narcissistic or ego libido seems to be the great reservoir from which the object cathexes are sent out and into which they are withdrawn once more; the narcissistic libidinal cathexis of the ego is the original state of things, realized in earliest childhood, and is merely covered by the later extrusions of libido, but in essentials persists behind them.

It should be the task of a libido theory of neurotic and psychotic

1 [It is scarcely necessary to explain that here as elsewhere, in speaking of the libido concentrating on 'objects', withdrawing from 'objects', etc., Freud has in mind the mental presentations (*Vorstellungen*) of objects and not, of course, objects in the external world.]

2 [*Footnote added* 1924:] Since neuroses other than the transference neuroses have become to a greater extent accessible to psychoanalysis, this limitation has lost its earlier validity.

disorders to express all the observed phenomena and inferred processes in terms of the economics of the libido. It is easy to guess that the vicissitudes of the ego libido will have the major part to play in this connection, especially when it is a question of explaining the deeper psychotic disturbances. We are then faced with the difficulty that our method of research, psychoanalysis, for the moment affords us assured information only on the transformations that take place in the object libido,[1] but is unable to make any immediate distinction between the ego libido and the other forms of energy operating in the ego.[2]

For the present, therefore,[3] no further development of the libido theory is possible, except upon speculative lines. It would, however, be sacrificing all that we have gained hitherto from psychoanalytic observation, if we were to follow the example of C. G. Jung and water down the meaning of the concept of libido itself by equating it with psychical drive force [*Triebkraft*] in general. The distinguishing of the sexual drive impulses from the rest and the consequent restriction of the concept of libido to the former receives strong support from the assumption which [219]
I have already discussed that there is a special chemistry of the sexual function.

[4] THE DIFFERENTIATION BETWEEN MEN AND WOMEN

As we all know, it is not until puberty that the sharp distinction is established between the masculine and feminine characters. From that time on, this contrast has a more decisive influence than any other upon the shaping of human life. It is true that the masculine and feminine dispositions are already easily recognizable in childhood. The development of the inhibitions of sexuality (shame, disgust, pity, etc.) takes place in little girls earlier and in the face of less resistance than in boys; the tendency to sexual repression seems in general to be greater; and, where the component drives of sexuality appear, they prefer the passive form. The auto-erotic activity of the erotogenic zones is, however, the same in both sexes, and owing to this uniformity there is no possibility of a distinction between the two sexes such as arises after puberty. So far as the

1 [*Footnote added* 1924:] See my previous footnote.

2 [*Footnote added* 1915:] Cf. my paper on narcissism (1914*c*). [*RSE*, **14**, 65–8. *Added* 1920:] The term 'narcissism' was not introduced, as I erroneously stated in that paper, by Näcke, but by Havelock Ellis. [Ellis himself subsequently (1927) discussed this point in detail and considered that the honours should be divided.]

3 [This paragraph was added in 1920.]

auto-erotic and masturbatory manifestations of sexuality are concerned, we might lay it down that the sexuality of little girls is of a wholly masculine character. Indeed, if we were able to give a more definite connotation to the concepts of 'masculine' and 'feminine', it would even be possible to maintain that libido is invariably and necessarily of a masculine nature, whether it occurs in men or in women and irrespectively of whether its object is a man or a woman.[1]

[220] Since I have become acquainted[2] with the notion of bisexuality I have regarded it as the decisive factor, and without taking bisexuality into account I think it would scarcely be possible to arrive at an understanding of the sexual manifestations that are actually to be observed in men and women.

Leading Zones in Men and Women

Apart from this I have only the following to add. The leading erotogenic zone in female children is located at the clitoris, and is thus homologous to the masculine genital zone of the glans penis. All my experience concerning masturbation in little girls has related to the clitoris and not to the regions of the external genitalia that are important in later sexual functioning. I am even doubtful whether a female child can be led by the influence of seduction to anything other than clitoridal masturbation. If such a thing occurs, it is quite exceptional. The spontaneous discharges

1 [Before 1924 the words from 'libido' to the end of the sentence were printed in spaced type. – *Footnote added* 1915:] It is essential to understand clearly that the concepts of 'masculine' and 'feminine', whose meaning seems so unambiguous to ordinary people, are among the most confused that occur in science. It is possible to distinguish at least three uses. 'Masculine' and 'feminine' are used sometimes in the sense of activity and passivity, sometimes in a biological, and sometimes, again, in a sociological sense. The first of these three meanings is the essential one and the most serviceable in psychoanalysis. When, for instance, libido was described in the text above as being 'masculine', the word was being used in this sense, for a drive is always active even when it has a passive aim in view. The second, or biological, meaning of 'masculine' and 'feminine' is the one whose applicability can be determined most easily. Here 'masculine' and 'feminine' are characterized by the presence of spermatozoa or ova respectively and by the functions proceeding from them. Activity and its concomitant phenomena (more powerful muscular development, aggressiveness, greater intensity of libido) are as a rule linked with biological masculinity; but they are not necessarily so, for there are animal species in which these qualities are on the contrary assigned to the female. The third, or sociological, meaning receives its connotation from the observation of actually existing masculine and feminine individuals. Such observation shows that in human beings pure masculinity or femininity is not to be found either in a psychological or a biological sense. Every individual on the contrary displays a mixture of the character traits belonging to his own and to the opposite sex; and he shows a combination of activity and passivity whether or not these last character traits tally with his biological ones. [A later discussion of this point can be found in a footnote to Chapter IV of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 95–6 *n.* 3.]

2 [In 1905 only: 'through Wilhelm Fliess'. Cf. end of footnote 2, p. 128 above.]

of sexual excitement which occur so often precisely in little girls are expressed in spasms of the clitoris. Frequent erections of that organ make it possible for girls to form a correct judgement, even without any instruction, of the sexual manifestations of the other sex: they merely transfer on to boys the sensations derived from their own sexual processes.

If we are to understand how a little girl turns into a woman, we must follow the further vicissitudes of this excitability of the clitoris. Puberty, which brings about so great an accession of libido in boys, is marked in girls by a fresh wave of *repression*, in which it is precisely clitoridal sexuality that is affected. What is thus overtaken by repression is a piece of [221]
masculine sexuality. The intensification of the brake upon sexuality brought about by pubertal repression in women serves as a stimulus to the libido in men and causes an increase of its activity. Along with this heightening of libido there is also an increase of sexual overvaluation which only emerges in full force in relation to a woman who holds herself back and who denies her sexuality. When at last the sexual act is permitted and the clitoris itself becomes excited, it still retains a function: the task, namely, of transmitting the excitation to the adjacent female sexual parts, just as – to use a simile – pine shavings can be kindled in order to set a log of harder wood on fire. Before this transference [*Übertragung*] can be effected, a certain interval of time must often elapse, during which the young woman is anaesthetic. This anaesthesia may become permanent if the clitoridal zone refuses to abandon its excitability, an event for which the way is prepared precisely by an extensive activity of that zone in childhood. Anaesthesia in women, as is well known, is often only apparent and local. They are anaesthetic at the vaginal orifice but are by no means incapable of excitement originating in the clitoris or even in other zones. Alongside these erotogenic determinants of anaesthesia must also be set the psychical determinants, which equally arise from repression.

When erotogenic susceptibility to stimulation has been successfully transferred by a woman from the clitoris to the vaginal orifice, it implies that she has adopted a new leading zone for the purposes of her later sexual activity. A man, on the other hand, retains his leading zone unchanged from childhood. The fact that women change their leading erotogenic zone in this way, together with the wave of repression at puberty, which, as it were, puts aside their childish masculinity, are the chief determinants of the greater proneness of women to neurosis and especially to hysteria.

These determinants, therefore, are intimately related to the essence of femininity.[1]

[5] THE FINDING OF AN OBJECT

[222] The processes at puberty thus establish the primacy of the genital zones; and, in a man, the penis, which has now become capable of erection, presses forward insistently towards the new sexual aim – penetration into a cavity in the body which excites his genital zone. Simultaneously on the psychical side the process of finding an object, for which preparations have been made from earliest childhood, is completed. At a time at which the first beginnings of sexual satisfaction are still linked with the taking of nourishment, the sexual drive has a sexual object outside the infant's own body in the shape of his mother's breast. It is only later that the drive loses that object, just at the time, perhaps, when the child is able to form a total idea of the person to whom the organ that is giving him satisfaction belongs. As a rule the sexual drive then becomes auto-erotic, and not until the period of latency has been passed through is the original relation restored. There are thus good reasons why a child sucking at his mother's breast has become the prototype of every relation of love. The finding of an object is in fact a refinding of it.[2]

The Sexual Object During Early Infancy

But even after sexual activity has become detached from the taking of nourishment, an important part of this first and most significant of all sexual relations is left over, which helps to prepare for the choice of an object and thus to restore the happiness that has been lost. All through the period of latency children learn to feel for other people who help them in their helplessness and satisfy their needs a love which is on the

1 [The course of development of sexuality in women was further examined by Freud more particularly on four later occasions: in his case history of a homosexual woman (1920*a*), *RSE*, **18**, 139 ff., in his discussion of the consequences of the anatomical distinction between the sexes (1925*j*), ibid., **19**, 249 ff., in his paper on female sexuality (1931*b*), ibid., **21**, 215 ff., and in Lecture XXXIII of his *New Introductory Lectures* (1933*a*), ibid., **22**, 99 ff. The importance of the clitoris in the childhood of girls is already mentioned in a letter to Fliess of November 14, 1897 (Freud, 1950*a*, Letter 75; ibid., **1**, 296).]

2 [*Footnote added* 1915:] Psychoanalysis informs us that there are two methods of finding an object. The first, described in the text, is the 'anaclitic' [*Anlehnung*] one, based on attachment to early infantile prototypes. The second is the narcissistic one, which seeks the subject's own ego and finds it again in other people. This latter method is of particularly great importance in cases where the outcome is a pathological one, but it is not relevant to the present context. [The point is elaborated in Section II of Freud's paper on narcissism (1914*c*), ibid., **14**, 75 ff. – The paragraph in the text above, written in 1905, does not appear to harmonize with the remarks on the subject on pp. 177 above and 206 f. below, written in 1915 and 1920 respectively.]

model of, and a continuation of, their relation as sucklings to their nursing mother. There may perhaps be an inclination to dispute the possibility of identifying a child's affection and esteem for those who look after him with sexual love. I think, however, that a closer psychological examination may make it possible to establish this identity beyond any doubt. A child's intercourse with anyone responsible for his care affords him an unending source of sexual excitation and satisfaction from her erotogenic zones. This is especially so since the person in charge of him, who, after all, is as a rule his mother, herself regards him with feelings that are derived from her own sexual life: she strokes him, kisses him, rocks him and quite clearly treats him as a substitute for a complete sexual object.[1] A mother would probably be horrified if she were made aware that all her marks of affection were rousing her child's sexual drive and preparing for its later intensity. She regards what she does as asexual, 'pure' love, since, after all, she carefully avoids applying more excitations to the child's genitals than are unavoidable in nursery care. As we know, however, the sexual drive is not aroused only by direct excitation of the genital zone. What we call affection will unfailingly show its effects one day on the genital zones as well. Moreover, if the mother understood more of the high importance of the part played by drives in mental life as a whole – in all its ethical and psychical achievements – she would spare herself any self-reproaches even after her enlightenment. She is only fulfilling her task in teaching the child to love. After all, he is meant to grow up into a strong and capable person with vigorous sexual needs and to accomplish during his life all the things that human beings are urged to do by their drives. It is true that an excess of parental affection does harm by causing precocious sexual maturity and also because, by spoiling the child, it makes him incapable in later life of temporarily doing without love or of being content with a smaller amount of it. One of the clearest indications that a child will later become neurotic is to be seen in an insatiable demand for his parents' affection. And on the other hand neuropathic parents, who are inclined as a rule to display excessive affection, are precisely those who are most likely by their caresses to arouse the child's disposition to neurotic illness. Incidentally, this example shows that there are ways more direct than inheritance by which neurotic parents can hand their disorder on to their children.

[223]

[224]

1 Anyone who considers this 'sacrilegious' may be recommended to read Havelock Ellis's views [1903, 18] on the relation between mother and child, which agree almost completely with mine.

Infantile Anxiety

Children themselves behave from an early age as though their dependence on the people looking after them were in the nature of sexual love. Anxiety in children is originally nothing other than an expression of the fact that they are feeling the loss of the person they love. It is for this reason that they are frightened of every stranger. They are afraid in the dark because in the dark they cannot see the person they love; and their fear is soothed if they can take hold of that person's hand in the dark. To attribute to bogeys and blood-curdling stories told by nurses the responsibility for making children timid is to overestimate their efficacy. The truth is merely that children who are inclined to be timid are affected by stories which would make no impression whatever upon others, and it is only children with a sexual drive that is excessive or has developed prematurely or has become vociferous owing to too much petting who are inclined to be timid. In this respect a child, by turning his libido into anxiety when he cannot satisfy it, behaves like an adult. On the other hand an adult who has become neurotic owing to his libido being unsatisfied behaves in his anxiety like a child: he begins to be frightened when he is alone, that is to say when he is away from someone of whose love he had felt secure, and he seeks to assuage this fear by the most childish measures.[1]

The Barrier Against Incest[2]

[225] We see, therefore, that the parents' affection for their child may awaken his sexual drive prematurely (i.e. before the somatic conditions of puberty are present) to such a degree that the mental excitation breaks through in an unmistakable fashion to the genital system. If, on the other hand, they are fortunate enough to avoid this, then their affection can perform its task of directing the child in his choice of a sexual object

1 For this explanation of the origin of infantile anxiety I have to thank a three-year-old boy whom I once heard calling out of a dark room: 'Auntie, speak to me! I'm frightened because it's so dark.' His aunt answered him: 'What good would that do? You can't see me.' 'That doesn't matter,' replied the child, 'if anyone speaks, it gets light.' Thus what he was afraid of was not the dark, but the absence of someone he loved; and he could feel sure of being soothed as soon as he had evidence of that person's presence. [*Added* 1920:] One of the most important results of psychoanalytic research is this discovery that neurotic anxiety arises out of libido, that it is the product of a transformation of it, and that it is thus related to it in the same kind of way as vinegar is to wine. A further discussion of this problem can be found in my *Introductory Lectures on Psychoanalysis* (1916–17*a*), Lecture XXV, though even there, it must be confessed, the question is not finally cleared up. [*RSE*, **16**, 346 ff. For Freud's latest views on the subject of anxiety see his *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 142 ff., and his *New Introductory Lectures* (1933*a*), Lecture XXXII, ibid., **22**, 72 ff.]

2 [This side-heading was omitted, probably by an oversight, from 1924 onwards.]

when he reaches maturity. No doubt the simplest course for the child would be to choose as his sexual objects the same persons whom, since his childhood, he has loved with what may be described as damped-down libido.[1] But, by the postponing of sexual maturation, time has been gained in which the child can erect, among other restraints on sexuality, the barrier against incest, and can thus take up into himself the moral precepts which expressly exclude from his object choice, as being blood relations, the persons whom he has loved in his childhood. Respect for this barrier is essentially a cultural demand made by society. Society must defend itself against the danger that the interests which it needs for the establishment of higher social units may be swallowed up by the family; and for this reason, in the case of every individual, but in particular of adolescent boys, it seeks by all possible means to loosen their connection with their family – a connection which, in their childhood, is the only important one.[2]

It is in the world of ideas, however, that the choice of an object is accomplished at first; and the sexual life of maturing youth is almost [226] entirely restricted to indulging in phantasies [*Phantasien*][T], that is, in ideas that are not destined to be carried into effect.[3] In these phantasies

1 [*Footnote added* 1915:] Cf. what has been said on p. 177 about children's object choice and the 'affectionate current'.

2 [*Footnote added* 1915:] The barrier against incest is probably among the historical acquisitions of mankind, and, like other moral taboos, has no doubt already become established in many persons by organic inheritance. (Cf. my *Totem and Taboo*, 1912–13*a* [*RSE*, **13**, 11 ff.].) Psychoanalytic investigation shows, however, how intensely the individual struggles with the temptation to incest during his period of growth and how frequently the barrier is transgressed in phantasies and even in reality. – [Though this is its first published appearance, the 'horror of incest' had been discussed by Freud on May 31, 1897 (Draft N in Freud, 1950*a*) – some months, that is, before his first revelation of the Oedipus complex. In that draft too he accounts for it on the ground that incest is 'antisocial'.]

3 [*Footnote added* 1920:] The phantasies of the pubertal period have as their starting point the infantile sexual researches that were abandoned in childhood. No doubt, too, they are also present before the end of the latency period. They may persist wholly, or to a great extent, unconsciously and for that reason it is often impossible to date them accurately. They are of great importance in the origin of many symptoms, since they precisely constitute preliminary stages of these symptoms and thus lay down the forms in which the repressed libidinal components find satisfaction. In the same way, they are the prototypes of the nocturnal phantasies which become conscious as dreams. Dreams are often nothing more than revivals of pubertal phantasies of this kind under the influence of, and in relation to, some stimulus left over from the waking life of the previous day (the 'day's residues'). [See Chapter VI, Section I, of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 440 f.] Some among the sexual phantasies of the pubertal period are especially prominent, and are distinguished by their very general occurrence and by being to a great extent independent of individual experience. Such are the adolescent's phantasies of overhearing his parents in sexual intercourse, of having been seduced at an early age by someone he loves and of having been threatened with castration [cf. the discussion of 'primal phantasies' in Lecture XXIII of Freud's *Introductory Lectures* (1916–17*a*), ibid., **16**, 325 f.]; such, too, are his phantasies of being in the womb, and even of experiences there, and the so-called 'family romance', in which he reacts to the difference between his attitude towards his parents now and in his childhood. The close relations existing between

[227] the infantile tendencies invariably emerge once more, but this time with intensified pressure from somatic sources. Among these tendencies the first place is taken with uniform frequency by the child's sexual impulses towards his parents, which are as a rule already differentiated owing to the attraction of the opposite sex – the son being drawn towards his mother and the daughter towards her father.[1] At the same time as these plainly incestuous phantasies are overcome and repudiated, one of the most significant, but also one of the most painful, psychical achievements of the pubertal period is completed: detachment from parental authority, a process that alone makes possible the opposition, which is so important for the progress of civilization, between the new generation and the old. At every stage in the course of development through which all human beings ought by rights to pass, a certain number are held back; so there are some who have never got over their parents' authority and have withdrawn their affection from them either very incompletely or not at all. They are mostly girls, who, to the delight of their parents, have persisted in all their childish love far beyond puberty. It is most instructive to find that it is precisely these girls who in their later marriage lack the capacity to give their husbands what is due to them; they make cold wives and remain sexually anaesthetic. We learn from this that sexual love and what appears to be nonsexual love for parents are fed from the same sources; the latter, that is to say, merely corresponds to an infantile fixation of the libido.

The closer one comes to the deeper disturbances of psychosexual development, the more unmistakably the importance of incestuous object choice emerges. In psychoneurotics a large portion or the whole of their psychosexual activity in finding an object remains in the unconscious as a result of their repudiation of sexuality. Girls with an

these phantasies and myths has been demonstrated in the case of the last instance by Otto Rank (1909). [Cf. also Freud's own paper on 'Family Romances' (1909*c*), *RSE*, **9**, 211 ff., and his long footnote to Section G of Part I of his case history of the 'Rat Man' (1909*d*), ibid., **10**, 158 f. *n*.]

It has justly been said that the Oedipus complex is the nuclear complex of the neuroses, and constitutes the essential part of their content. It represents the peak of infantile sexuality, which, through its after-effects, exercises a decisive influence on the sexuality of adults. Every new arrival on this planet is faced with the task of mastering the Oedipus complex; anyone who fails to do so falls victim to neurosis. With the progress of psychoanalytic studies the importance of the Oedipus complex has become more and more clearly evident; its recognition has become the shibboleth that distinguishes the adherents of psychoanalysis from its opponents.

[*Added* 1924:] In another work (1924), Rank has traced attachment to the mother back to the prehistoric intrauterine period and has thus indicated the biological foundation of the Oedipus complex. He differs from what has been said above, by deriving the barrier against incest from the traumatic effect of anxiety at birth. [See Chapter X of *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 133.]

1 Cf. my remarks in *The Interpretation of Dreams* (1900*a*), on the inevitability of Fate in the fable of Oedipus [Chapter V, Section D (*β*); *RSE*, **4**, 231 ff.]

exaggerated need for affection and an equally exaggerated horror of the real demands made by sexual life have an irresistible temptation, on the one hand, to realize the ideal of asexual love in their lives and, on the other hand, to conceal their libido behind an affection which they can express without self-reproaches, by holding fast throughout their lives to their infantile fondness, revived at puberty, for their parents or [228]
brothers and sisters. Psychoanalysis has no difficulty in showing persons of this kind that they are *in love*, in the everyday sense of the word, with these blood relations of theirs; for, with the help of their symptoms and other manifestations of their illness, it traces their unconscious thoughts and translates them into conscious ones. In cases in which someone who has previously been healthy falls ill after an unhappy experience in love it is also possible to show with certainty that the mechanism of his illness consists in a turning back of his libido on to those whom he preferred in his infancy.

After-effects of Infantile Object Choice

Even a person who has been fortunate enough to avoid an incestuous fixation of his libido does not entirely escape its influence. It often happens that a young man falls in love seriously for the first time with a mature woman, or a girl with an elderly man in a position of authority; this is clearly an echo of the phase of development that we have been discussing, since these figures are able to reanimate pictures of their mother or father.[1] There can be no doubt that every object choice whatever is based, though less closely, on these prototypes. A man, especially, looks for someone who can represent his picture of his mother, as it has dominated his mind from his earliest childhood; and accordingly, if his mother is still alive, she may well resent this new version of herself and meet her with hostility. In view of the importance of a child's relations to his parents in determining his later choice of a sexual object, it can easily be understood that any disturbance of those relations will produce the gravest effects upon his adult sexual life. Jealousy in a lover is never without an infantile root or at least an infantile reinforcement. If there are quarrels between the parents or if their marriage is unhappy, the ground will be prepared in their children for the severest predisposition to a disturbance of sexual development or to a neurotic illness.

A child's affection for his parents is no doubt the most important infantile trace which, after being revived at puberty, points the way to his

1 [*Footnote added* 1920:] Cf. my paper 'A Special Type of Choice of Object Made by Men' (1910*h*) [*RSE*, **11**, 153 ff.].

choice of an object; but it is not the only one. Other starting points with
[229] the same early origin enable a man to develop more than one sexual line, based no less upon his childhood, and to lay down very various conditions for his object choice.[1]

Prevention of Inversion

One of the tasks implicit in object choice is that it should find its way to the opposite sex. This, as we know, is not accomplished without a certain amount of fumbling. Often enough the first impulses after puberty go astray, though without any permanent harm resulting. Dessoir [1894] has justly remarked upon the regularity with which adolescent boys and girls form sentimental friendships with others of their own sex. No doubt the strongest force working against a permanent inversion of the sexual object is the attraction which the opposing sexual characters exercise upon one another. Nothing can be said within the framework of the present discussion to throw light upon it.[2] This factor is not in itself, however, sufficient to exclude inversion; there are no doubt a variety of other contributory factors. Chief among these is its authoritative prohibition by society. Where inversion is not regarded as a crime it will be found that it answers fully to the sexual inclinations of no small number of people. It may be presumed, in the next place, that in the case of men a childhood recollection of the affection shown them by their mother and others of the female sex who looked after them when they were children contributes powerfully to directing their choice towards women;[3] on the other hand, their early experience of being deterred by their father from sexual activity and their competitive relation with him deflect them from their own sex. Both of these two factors apply equally
[230] to girls, whose sexual activity is particularly subject to the watchful guardianship of their mother. They thus acquire a hostile relation to their own sex which influences their object choice decisively in what is regarded as the normal direction. The education of boys by male persons

1 [*Footnote added* 1915:] The innumerable peculiarities of the erotic life of human beings as well as the compulsive character of the process of falling in love itself are quite unintelligible except by reference back to childhood and as being residual effects of childhood.

2 [*Footnote added* 1924:] This is the place at which to draw attention to Ferenczi's *Versuch einer Genitaltheorie* (1924), a work which, though somewhat fanciful, is nevertheless of the greatest interest, and in which the sexual life of the higher animals is traced back to their biological evolution.

3 [The rest of this sentence and the two following ones date from 1915. In the editions of 1905 and 1910 the following passage takes their place: 'while in the case of girls, who in any case enter a period of repression at puberty, impulses of rivalry play a part in discouraging them from loving members of their own sex.']

(by slaves, in antiquity) seems to encourage homosexuality. The frequency of inversion among the present-day aristocracy is made somewhat more intelligible by their employment of menservants, as well as by the fact that their mothers give less personal care to their children. In the case of some hysterics it is found that the early loss of one of their parents, whether by death, divorce or separation, with the result that the remaining parent absorbs the whole of the child's love, determines the sex of the person who is later to be chosen as a sexual object, and may thus open the way to permanent inversion.

SUMMARY

[231] The time has arrived for me to attempt to summarize what I have said. We started out from the aberrations of the sexual drive in respect of its object and of its aim and we were faced with the question of whether these arise from an innate disposition or are acquired as a result of experiences in life. We arrived at an answer to this question from an understanding, derived from psychoanalytic investigation, of the workings of the sexual drive in psychoneurotics, a numerous class of people and one not far removed from the healthy. We found that in them tendencies to every kind of perversion can be shown to exist as unconscious forces and betray their presence as factors leading to the formation of symptoms. It was thus possible to say that neurosis is, as it were, the negative of perversion. In view of what was now seen to be the wide dissemination of tendencies to perversion we were driven to the conclusion that a disposition to perversions is an original and universal disposition of the human sexual drive and that normal sexual behaviour is developed out of it as a result of organic changes and psychical inhibitions occurring in the course of maturation; we hoped to be able to show the presence of this original disposition in childhood. Among the forces restricting the direction taken by the sexual drive we laid emphasis upon shame, disgust, pity and the structures of morality and authority erected by society. We were thus led to regard any established aberration from normal sexuality as an instance of developmental inhibition and infantilism. Though it was necessary to place in the foreground the importance of the variations in the original disposition, a cooperative and not an opposing relation was to be assumed as existing between them and the influences of actual life. It appeared, on the other hand, that since the original disposition is necessarily a complex one, the sexual drive itself must be something put together from various factors, and that in the perversions it falls apart, as it were, into its components. The perversions were thus seen to be, on the one hand, inhibitions and, on the other hand, dissociations of normal development. Both these aspects

[*Auffassungen*] were brought together in the supposition that the sexual drive of adults arises from a combination of a number of impulses of [232]
childhood into a unity, an impulsion with a single aim.

After having explained the preponderance of perverse tendencies in psychoneurotics by recognizing it as a collateral filling of subsidiary channels when the main current of the drive stream has been blocked by 'repression',[1] we proceeded to a consideration of sexual life in childhood. We found it a regrettable thing that the existence of the sexual drive in childhood has been denied and that the sexual manifestations not infrequently to be observed in children have been described as irregularities. It seemed to us on the contrary that children bring germs of sexual activity with them into the world, that they already enjoy sexual satisfaction when they begin to take nourishment and that they persistently seek to repeat the experience in the familiar activity of 'thumbsucking'. The sexual activity of children, however, does not, it appeared, develop *pari passu* with their other functions, but, after a short period of efflorescence from the ages of two to five,[2] enters upon the so-called period of latency. During that period the production of sexual excitation is not by any means stopped but continues and produces a store of energy which is employed to a great extent for purposes other than sexual – namely, on the one hand, in contributing the sexual components to social feelings and, on the other hand (through repression and reaction-formation), in building up the subsequently developed barriers against sexuality. On this view, the forces destined to retain the sexual drive upon certain lines are built up in childhood chiefly at the cost of perverse sexual impulses and with the assistance of education. A certain portion of the infantile sexual impulses would seem to evade these uses and succeed in expressing itself as sexual activity. We next found that sexual excitation in children springs from a multiplicity of forces. Satisfaction[3] arises first and foremost from the appropriate sen- [233]
sory excitation of what we have described as erotogenic zones. It seems probable that any part of the skin and any sense organ – probably, indeed, *any* organ[4] – can function as an erotogenic zone, though there

1 [*Footnote added* 1915:] This does not apply only to the 'negative' tendencies to perversion which appear in neuroses but equally to the 'positive', properly so-called, perversions. Thus these latter are to be derived not merely from a fixation of infantile tendencies but also from a regression to those tendencies as a result of other channels of the sexual current being blocked. It is for this reason that the positive perversions also are accessible to psychoanalytic therapy.

2 [The last seven words were first inserted in 1915. In the edition of that year, however, the ages given were 'three to five'. The 'two' was substituted in 1920.]

3 [See Editors' comment at the end of the long footnote on p. 191 above.]

4 [This parenthesis was added in 1915.]

are some particularly marked erotogenic zones whose excitation would seem to be secured from the very first by certain organic contrivances. It further appears that sexual excitation arises as a by-product, as it were, of a large number of processes that occur in the organism, as soon as they reach a certain degree of intensity, and most especially of any relatively powerful emotion, even though it is of a distressing nature. The excitations from all these sources are not yet combined; but each follows its own separate aim, which is merely the attainment of a certain sort of pleasure. In childhood, therefore, the sexual drive is not unified and is at first[1] without an object, that is, auto-erotic.

The erotogenic zone of the genitals begins to make itself noticeable, it seems, even during the years of childhood. This may happen in two ways. Either, like any other erotogenic zone, it yields satisfaction in response to appropriate sensory stimulation; or, in a manner which is not quite understandable, when satisfaction is derived from other sources, a sexual excitation is simultaneously produced which has a special relation to the genital zone. We were reluctantly obliged to admit that we could not satisfactorily explain the relation between sexual satisfaction and sexual excitation, or that between the activity of the genital zone and the activity of the other sources of sexuality.

We found from the study of neurotic disorders[2] that beginnings of an organization of the sexual drive components can be detected in the sexual life of children from its very beginning. During a first, very early phase, oral erotism occupies most of the picture. A second of these pregenital organizations is characterized by the predominance of sadism and anal erotism. It is not until a third phase has been reached that the genital zones proper contribute their share in determining sexual life, and in children this last phase is developed only so far as to a primacy of the phallus.[3]

[234] We were then obliged to recognize, as one of our most surprising findings, that this early efflorescence of infantile sexual life (between the ages of two and five) already gives rise to the choice of an object, with all the wealth of mental activities which such a process involves.[4] Thus, in spite of the lack of synthesis between the different drive components and the uncertainty of the sexual aim, the phase of development

1 [The words 'not unified and is at first' were added in 1920.]

2 [This and the next two paragraphs were added in 1920.]

3 [The last clause was added in 1924.]

4 [Cf. the end of footnote 2, p. 196 above.]

corresponding to that period must be regarded as an important precursor to the subsequent final sexual organization.

The fact that the onset of sexual development in human beings occurs in two phases, i.e. that the development is interrupted by the period of latency, seemed to call for particular notice. This appears to be one of the necessary conditions of the aptitude of men for developing a higher civilization, but also of their tendency to neurosis. So far as we know, nothing analogous is to be found in man's animal relatives. It would seem that the origin of this peculiarity of man must be looked for in the prehistory of the human species.

It was not possible to say what amount of sexual activity can occur in childhood without being described as abnormal or detrimental to further development. The nature of these sexual manifestations was found to be predominantly masturbatory. Experience further showed that the external influences of seduction are capable of provoking interruptions of the latency period or even its cessation, and that in this connection the sexual drive of children proves in fact to be polymorphously perverse; it seems, moreover, that any such premature sexual activity diminishes a child's educability.

In spite of the gaps in our knowledge of infantile sexual life, we had to proceed to an attempt at examining the alterations brought about in it by the arrival of puberty. We selected two of these as being the decisive ones: the subordination of all the other sources of sexual excitation under the primacy of the genital zones and the process of finding an object. Both of these are already adumbrated in childhood. The first is accomplished by the mechanism of exploiting fore-pleasure: what were formerly self-contained sexual acts, attended by pleasure and excitation, become acts preparatory to the new sexual aim (the discharge of the sexual products), the attainment of which is enormously pleasurable and brings the sexual excitation to an end. In this connection we had to take [235] into account the differentiation of sexuality into masculine and feminine; and we found that in order to become a woman a further stage of repression is necessary, which discards a portion of infantile masculinity and prepares the woman for changing her leading genital zone. As regards object choice, we found that it is given its orientation by the childhood hints (revived at puberty) of the child's sexual inclination towards his parents and others in charge of him, but that it is diverted away from them, on to other people who resemble them, owing to the barrier against incest which has meanwhile been erected. Finally, it must be added that during the transition period of puberty the processes of

somatic and of psychical development continue for a time side by side independently, until the irruption of an intense mental erotic impulse, leading to the innervation of the genitals, brings about the unity of the erotic function which is necessary for normality.

Factors Interfering with Development

Every step on this long path of development can become a point of fixation, every juncture in this involved combination can be an occasion for a dissociation of the sexual drive, as we have already shown from numerous instances.[1] It remains for us to enumerate the various factors, internal and external, that interfere with development, and to indicate the place in the mechanism on which the disturbance arising from each of them impinges. The factors that we shall enumerate can evidently not be of equal importance, and we must be prepared for difficulties in assigning an appropriate value to each.

[1] *Constitution and Heredity*

First and foremost we must name the innate variety of sexual constitutions, upon which it is probable that the principal weight falls, but which can clearly only be inferred from their later manifestations and even then not always with great certainty. We picture this variety as a preponder-
[236] ance of one or another of the many sources of sexual excitation, and it is our view that a difference in disposition of this kind is always bound to find expression in the final result, even though that result may not overstep the limits of what is normal. No doubt it is conceivable that there may also be variations in the original disposition of a kind which must necessarily, and without the concurrence of any other factors, lead to the development of an abnormal sexual life. These might be described as 'degenerative' and be regarded as an expression of inherited degeneracy. In this connection I have a remarkable fact to record. In more than half of the severe cases of hysteria, obsessional neurosis, etc., which I have treated psychotherapeutically, I have been able to prove with certainty that the patient's father suffered from syphilis before marriage, whether there was evidence of tabes or general paralysis, or whether the anamnesis indicated in some other way the presence of syphilitic disease. I

1 [The further problem of a possible relation between the point of fixation and the type of neurosis developed – the problem of the 'choice of neurosis' – is not dealt with in these essays, though it had long been in Freud's thoughts. See, for instance, his letters to Fliess of May 30, 1896, and of December 9, 1899 (Freud, 1950*a*, Letters 46 and 125). The subject was touched on in a paper almost contemporary with the present work (1906*a*, p. 285 of the present volume) and discussed more fully in a later paper on 'The Disposition to Obsessional Neurosis' (1913*i*), *RSE*, **12**, 313 ff.]

should like to make it perfectly plain that the children who later became neurotic bore no physical signs of hereditary syphilis, so that it was their abnormal sexual constitution that was to be regarded as the last echo of their syphilitic heritage. Though I am far from wishing to assert that descent from syphilitic parents is an invariable or indispensable aetiological condition of a neuropathic constitution, I am nevertheless of the opinion that the coincidence which I have observed is neither accidental nor unimportant.

The hereditary conditions in the case of positive perverts are less well known, for they know how to avoid investigation. Yet there are good reasons to suppose that what is true of the neuroses applies also to the perversions. For it is no rare thing to find perversions and psychoneuroses occurring in the same family, and distributed between the two sexes in such a way that the male members of the family, or one of them, are positive perverts, while the females, true to the tendency of their sex to repression, are negative perverts, that is, hysterics.[1] This is good evidence of the essential connections which we have shown to exist between the two disorders.

Further Modification

On the other hand, it is not possible to adopt the view that the form to be [237]
taken by sexual life is unambiguously decided, once and for all, with the inception of the different components of the sexual constitution. On the contrary, the determining process continues, and further possibilities arise according to the vicissitudes of the tributary streams of sexuality springing from their separate sources. This further modification is clearly what brings the decisive outcome, and constitutions which might be described as the same can lead to three different final results:

[(a) *Genital Weakness*]

If the relation between all the different dispositions – a relation which we will assume to be abnormal – persists and grows stronger at maturity, the result can only be a perverse sexual life. The analysis of abnormal constitutional disposition of this kind has not yet been properly taken in hand. But we already know cases which can easily be explained on such a basis as this. Writers on the subject, for instance, have asserted [see p. 127 f. above] that the necessary precondition of a whole number of perverse fixations lies in an innate weakness of the sexual drive. In this

1 [A detailed family tree of this kind is given in a letter to Fliess of January 11, 1897 (Freud, 1950*a*, Letter 55).]

form the view seems to me untenable. It makes sense, however, if what is meant is a constitutional weakness of one particular factor in the sexual drive, namely the genital zone – a zone which takes over the function of combining the separate sexual activities for the purposes of reproduction. For if the genital zone is weak, this combination, which is required to take place at puberty, is bound to fail, and the strongest of the other components of sexuality will continue its activity as a perversion.[1]

[(b)] *Repression*

A different result is brought about if in the course of development some of the components which are of excessive strength in the disposition are submitted to the process of repression (which, it must be insisted, is not equivalent to their being abolished). If this happens, the excitations concerned continue to be generated as before; but they are prevented by
[238] psychical obstruction from attaining their aim and are diverted into numerous other channels till they find their way to expression as symptoms. The outcome may be an approximately normal sexual life – though usually a restricted one – but there is in addition psychoneurotic illness.[2] These particular cases have become familiar to us from the psychoanalytic investigation of neurotics. Their sexual life begins like that of perverts, and a considerable part of their childhood is occupied with perverse sexual activity which occasionally extends far into maturity. A reversal due to repression then occurs, owing to internal causes (usually before puberty, but now and then even long afterwards), and from that time onwards neurosis takes the place of perversion, without the old impulses being extinguished. We are reminded of the proverb 'Junge Hure, alte Betschwester',[3] only that here youth has lasted all too short a time. The fact that perversion can be replaced by neurosis in the life of the same person, like the fact which we have already mentioned that perversion and neurosis can be distributed among different members of the same family, tallies with the view that neurosis is the negative of perversion.

1 [*Footnote added* 1915:] In such circumstances one often finds that at puberty a normal sexual current begins to operate at first, but that, as a result of its internal weakness, it breaks down in face of the first external obstacles and is then replaced by regression to the perverse fixation.

2 [Freud argued elsewhere that an approximately normal sexual life – albeit a restricted one – is transformed into a psychoneurosis only when the repression fails.]

3 ['A young whore makes an old nun.']

[(c)] *Sublimation*

The third alternative result of an abnormal constitutional disposition is made possible by the process of sublimation. This enables excessively strong excitations arising from particular sources of sexuality to find an outlet and use in other fields, so that a not inconsiderable increase in psychical efficiency results from a disposition which in itself is perilous. Here we have one of the origins of artistic activity; and, according to the completeness or incompleteness of the sublimation, a characterological analysis of a highly gifted individual, and in particular of one with an artistic disposition, may reveal a mixture, in every proportion, of efficiency, perversion and neurosis. A subspecies of sublimation is to be found in suppression by reaction-formation, which, as we have seen, begins during a child's period of latency and continues in favourable cases throughout his whole life. What we describe as a person's 'character' is built up to a considerable extent from the material of sexual excitations and is composed of drives that have been fixed since childhood, of constructions achieved by means of sublimation, and of other constructions, employed for effectively holding in check perverse [239]
impulses which have been recognized as being unutilizable.[1] The multifariously perverse sexual disposition of childhood can accordingly be regarded as the source of a number of our virtues, insofar as through reaction-formation it stimulates their development.[2]

[2] *Accidental Experiences*

No other influences on the course of sexual development can compare in importance with releases of sexuality, waves of repression and sublimations – the two latter being processes of which the inner causes are quite unknown to us. It might be possible to include repressions and sublimations as a part of the constitutional disposition, by regarding them as manifestations of it in life; and anyone who does so is justified in asserting that the final shape taken by sexual life is principally the outcome of the innate constitution. No-one with perception will, however, dispute that an interplay of factors such as this also leaves room for the modifying effects of accidental events experienced in childhood and

1 [*Footnote added* 1920:] In the case of some character traits it has even been possible to trace a connection with particular erotogenic components. Thus, obstinacy, thrift and orderliness arise from an exploitation of anal erotism, while ambition is determined by a strong urethral-erotic disposition. [See Freud, 1908*b*; *RSE*, **9**, 153–4 (last paragraph).]

2 Émile Zola, a keen observer of human nature, describes in *La joie de vivre* how a girl, cheerfully and selflessly and without thought of reward, sacrificed to those she loved everything that she possessed or could lay claim to – her money and her hopes. This girl's childhood was dominated by an insatiable thirst for affection, which was transformed into cruelty on an occasion when she found herself slighted in favour of another girl.

later. It is not easy[1] to estimate the relative efficacy of the constitutional and accidental factors. In theory one is always inclined to overestimate the former; therapeutic practice emphasizes the importance of the latter. It should, however, on no account be forgotten that the relation between the two is a cooperative and not a mutually exclusive one. The constitutional factor must await experiences before it can make itself felt; the accidental factor must have a constitutional basis in order to come into operation. To cover the majority of cases we can picture what has
[240] been described as a 'complemental series',[2] in which the diminishing intensity of one factor is balanced by the increasing intensity of the other; there is, however, no reason to deny the existence of extreme cases at the two ends of the series.

We shall be in even closer harmony with psychoanalytic research if we give a place of preference among the accidental factors to the experiences of early childhood. The single aetiological series then falls into two, which may be called the dispositional and the definitive. In the first the constitution and the accidental experiences of childhood interact in the same manner as do the disposition and later traumatic experiences in the second. All the factors that impair sexual development show their effects by bringing about a *regression*, a return to an earlier phase of development.

Let us now resume our task of enumerating the factors which we have found to exercise an influence on sexual development, whether they are themselves operative forces or merely manifestations of such forces.

[3] *Precocity*

One such factor is spontaneous sexual precocity whose presence at least can be demonstrated with certainty in the aetiology of the neuroses though, like other factors, it is not in itself a sufficient cause. It is manifested in the interruption, abbreviation or bringing to an end of the infantile period of latency; and it is a cause of disturbances by occasioning sexual manifestations which, owing, on the one hand, to the sexual inhibitions being incomplete and, on the other hand, to the genital system being undeveloped, are bound to be in the nature of perversions. These tendencies to perversion may thereafter either persist as such or, after

1 [The remainder of this paragraph and the whole of the next one were added in 1915.]

2 [In 1915 the term used was 'aetiological series' [*ätiologische Reihe*], which was altered to 'complemental series' [*Ergänzungsreihe*] in 1920. The latter term seems to have been first used by Freud in Lecture XXII of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 306. The correction of the phrase was not carried out where it occurs again a few lines lower down.]

repressions have set in, become the driving forces of neurotic symptoms. In any case sexual precocity makes more difficult the later control of the sexual drive by the higher mental agencies which is so desirable, and it increases the impulsive quality which, quite apart from this, characterizes the psychical representations [*Vertretungen*] of the drive. Sexual precocity often runs parallel with premature intellectual development and, linked in this way, is to be found in the childhood history of persons of the greatest eminence and capacity; under such conditions its effects do not seem to be so pathogenic as when it appears in isolation.[1] [241]

[*Other*] *Temporal Factors*

Other factors which, along with precocity, may be classed as temporal also deserve attention. The order in which the various drive impulses come into activity seems to be phylogenetically determined; so, too, does the length of time during which they are able to manifest themselves before they succumb to the effects of some freshly emerging drive impulse or to some typical repression. Variations, however, seem to occur both in temporal sequence and in duration, and these variations must exercise a determining influence upon the final result. It cannot be a matter of indifference whether a given current makes its appearance earlier or later than a current flowing in the opposite direction, for the effect of a repression cannot be undone. Divergences in the temporal sequence in which the components come together invariably produce a difference in the outcome. On the other hand, drive impulses which emerge with special intensity often run a surprisingly short course – as, for instance, the heterosexual attachment of persons who later become manifest homosexuals. There is no justification for the fear that trends which set in with the greatest violence in childhood will permanently dominate the adult character; it is just as likely that they will disappear and make way for an opposite tendency. ('Gestrenge Herren regieren nicht lange.')[2]

We are not in a position to give so much as a hint as to the causes of these temporal disturbances of the process of development. A prospect opens before us at this point upon a whole phalanx of biological and perhaps, too, of historical problems of which we have not even come within striking distance.

1 [Cf. some remarks on this point in the case history of 'Little Hans' (1909*b*), in the third section of Chapter III; *RSE*, **10**, 108. – The two following paragraphs were added in 1915.]

2 ['Harsh rulers have short reigns.']

[4] *Pertinacity of Early Impressions*

[242] The importance of all early sexual manifestations is increased by a psychical factor of unknown origin, which at the moment, it must be admitted, can only be brought forward as a provisional psychological concept. I have in mind the fact that, in order to account for the situation, it is necessary to assume that these early impressions of sexual life are characterized by an increased pertinacity or susceptibility to fixation in persons who are later to become neurotics or perverts. For the same premature sexual manifestations, when they occur in other persons, fail to make so deep an impression; they do not tend in a compulsive manner towards repetition nor do they lay down the path to be taken by the sexual drive for a whole lifetime. Part of the explanation of this pertinacity of early impressions may perhaps lie in another psychical factor which we must not overlook in the causation of the neuroses, namely the preponderance attaching in mental life to memory traces in comparison with recent impressions. This factor is clearly dependent on intellectual education and increases in proportion to the degree of individual culture. The savage has been described in contrast as 'das unglückselige Kind des Augenblickes'.[1] In consequence of the inverse relation holding between civilization and the free development of sexuality, of which the consequences can be followed far into the structure of our existences, the course taken by the sexual life of a child is just as unimportant for later life where the cultural or social level is relatively low as it is important where that level is relatively high.

Fixation

The ground prepared by the psychical factors which have just been enumerated affords a favourable basis for such stimulations of infantile sexuality as are experienced accidentally. The latter (first and foremost, seduction by other children or by adults) provide the material which, with the help of the former, can become fixated as a permanent disorder. A good proportion of the deviations from normal sexual life which are later observed both in neurotics and in perverts are thus established from the very first by the impressions of childhood – a period which is
[243] regarded as being devoid of sexuality. The causation is shared between a compliant constitution, precocity, the characteristic of increased

1 ['The hapless child of the moment.'] Increase in pertinacity may also possibly be the effect of an especially intense somatic manifestation of sexuality in early years. [Cf. an Editors' footnote at the end of 'A Case of Paranoia' (1915*f*), *RSE*, **14**, 269 *n*.]

pertinacity of early impressions and the chance stimulation of the sexual drive by extraneous influences.

The unsatisfactory conclusion, however, that emerges from these investigations of the disturbances of sexual life is that we know far too little of the biological processes constituting the essence of sexuality to be able to construct from our fragmentary information a theory adequate to the understanding alike of normal and of pathological conditions.

APPENDIX

LIST OF WRITINGS BY FREUD DEALING PREDOMINANTLY OR LARGELY WITH SEXUALITY

[244] *References to sexuality are, of course, to be found in a large majority of Freud's writings. The following list comprises those which are more directly concerned with the subject. The date at the beginning of each entry gives the year of publication. Fuller particulars of each work can be found in the Bibliography at the end of the present volume.*

1895*i* Review of Hegar's *Der Geschlechtstrieb.*
1898*a* 'Sexuality in the Aetiology of the Neuroses.'
1905*d* *Three Essays on the Theory of Sexuality*.
1905*g* Statement on Marriage Law Reform.
1905*h* Statement on Homosexuality.
1906*a* 'My Views on the Part Played by Sexuality in the Aetiology of the Neuroses.'
1907*c* 'The Sexual Enlightenment of Children.'
1908*b* 'Character and Anal Erotism.'
1908*c* 'On the Sexual Theories of Children.'
1908*d* '"Civilized" Sexual Morality and Modern Nervous Illness.'
1910*a* *Five Lectures on Psychoanalysis*, Lecture IV.
1910*c* *Leonardo da Vinci*, Chapter III.
1910*h* 'A Special Type of Choice of Object Made by Men.'
1910–11*a* 'More Children.'
1912*d* 'On the Universal Tendency to Debasement in the Sphere of Love.'
1912*f* 'Contributions to a Discussion on Masturbation.'
1913*i* 'The Disposition to Obsessional Neurosis.'
1913*j* 'The Claims of Psychoanalysis to Scientific Interest', Part II (C).
1913*k* Preface to Bourke's *Scatalogic Rites of All Nations*.
1914*c* 'On Narcissism: an Introduction.'
1916–17*a* *Introductory Lectures on Psychoanalysis*, Lectures XX, XXI, XXII and XXVI.

1916–17*e* 'On Transformations of Drive as Exemplified in Anal Erotism.'
1918*a* 'The Taboo of Virginity.'
1919*e* '"A Child is Being Beaten."'
1920*a* 'The Psychogenesis of a Case of Homosexuality in a Woman.'
1922*b* 'Some Neurotic Mechanisms in Jealousy, Paranoia and Homosexuality', Section C. [245]
1923*a* Two Encyclopaedia Articles: (2) 'The Libido Theory.'
1923*e* 'The Infantile Genital Organization.'
1924*c* 'The Economic Problem of Masochism.'
1924*d* 'The Dissolution of the Oedipus Complex.'
1925*j* 'Some Psychical Consequences of the Anatomical Distinction between the Sexes.'
1927*e* 'Fetishism.'
1931*a* 'Libidinal Types.'
1931*b* 'Female Sexuality.'
1933*a* *New Introductory Lectures on Psychoanalysis*, Lectures XXXII and XXXIII.
1940*a* *An Outline of Psychoanalysis*, Chapters III and VII.
1940*e* 'Splitting of the Ego in the Process of Defence.'
1951*a* Letter on Homosexuality.
1966*b* *Thomas Woodrow Wilson: A Psychological Study*, Draft of The Opening Chapter.

FREUD'S PSYCHOANALYTIC PROCEDURE

(1904 [1903])

EDITORS' NOTE

DIE FREUDSCHE PSYCHOANALYTISCHE METHODE

GERMAN EDITIONS

(1903 Probable date of composition.) [248]
1904 In Löwenfeld's *Die psychischen Zwangserscheinungen*, 545–51. (Wiesbaden: Bergmann.)
1906 *SKSN*, **1**, 218–24. (1911, 2nd ed., 213–19; 1920, 3rd ed.; 1922., 4th ed.)
1924 *Technik und Metapsychol.*, 3–10.
1925 *GS*, **6**, 3–10.
1942 *GW*, **5**, 3–10.
1975 *SA*, **Erg.**, 99–106. (Revised reprint of the *GW* edition.)

ENGLISH TRANSLATIONS

'Freud's Psycho-Analytic Method'
1924 *CP*, **1**, 264–71. (Tr. J. Bernays.)
'Freud's Psycho-Analytic Procedure'
1953 *SE*, **7**, 249–54. (Tr. James Strachey. Considerably altered version of the 1924 translation.)

The present translation is a revised and corrected reprint of the *SE* version.

Löwenfeld's book on compulsive phenomena, to which this paper was originally contributed, is spoken of by Freud in his case history of the 'Rat Man' (1909*d*, in a footnote in Part II; *RSE*, **10**, 168 *n.* 2) as the 'standard textbook' on obsessional neurosis. The book was reviewed by Freud himself (Freud, 1904*f*); see p. 233 ff. below. Löwenfeld explains that he persuaded Freud to make this contribution because his technique had been so greatly modified since it was described in *Studies on Hysteria* (1895*d*), *RSE*, **2**. Löwenfeld's preface is dated 'November, 1903'; so that Freud's paper was presumably written earlier in the same year.

The present account shows that the only remaining trace of the original hypnotic procedure was Freud's requirement that the patient should lie down. As regards externals, his technique remained unchanged from now onwards.

FREUD'S PSYCHOANALYTIC PROCEDURE

The particular psychotherapeutic procedure which Freud practises and [249]
describes as 'psychoanalysis' is an outgrowth of what was known as the 'cathartic' method and was discussed by him in collaboration with Josef Breuer in their *Studies on Hysteria* (1895*d*). This cathartic therapy was a discovery of Breuer's, and was first used by him some ten years earlier in the successful treatment of a hysterical woman patient, in the course of which he obtained an insight into the pathogenesis of her symptoms. As the result of a personal suggestion from Breuer, Freud revived this procedure and tested it on a considerable number of patients.

The cathartic method of treatment presupposed that the patient could be hypnotized, and was based on the widening of consciousness that occurs under hypnosis. Its aim was the removal of the pathological symptoms, and it achieved this by inducing the patient to return to the psychical state in which the symptom had appeared for the first time. When this was done, there emerged in the hypnotized patient memories, thoughts and impulses which had previously dropped out of his consciousness; and, as soon as he had related these mental [*seelischen*][T] processes of his to the physician, to the accompaniment of intense expressions of emotion, the symptom was overcome and its return prevented. This experience, which could be regularly repeated, was taken by the authors in their joint paper to signify that the symptom takes the place of suppressed [*unterdrückten*] processes which have not reached consciousness, that is, that it represents a transformation ('conversion') of these processes. They explained the therapeutic effectiveness of their treatment as due to the discharge [*Abfuhr*][T] of what had previously been, as it were, 'strangulated' affect attaching to the suppressed mental acts ('abreaction'). But in practice the simple schematic outline of the therapeutic operation was almost always complicated by the circumstance that it was not a *single* ('traumatic') impression, but in most cases a *series* of impressions – not easily scanned – which had participated in the creation of the symptom.

Seele

[250] The main characteristic of the cathartic method, in contrast to all other methods used in psychotherapy, consists in the fact that its therapeutic efficacy does not lie in a prohibitive suggestion by the physician. The expectation is rather that the symptoms will disappear automatically as soon as the operation, based on certain hypotheses concerning the psychical mechanism, succeeds in diverting the course of mental processes from their previous channel, which found an outlet in the formation of the symptom.

The changes which Freud introduced in Breuer's cathartic method of treatment were at first changes in technique; these, however, led to new findings and have finally necessitated a different though not contradictory conception [*Auffassung*][T] of the therapeutic process.

The cathartic method had already renounced suggestion; Freud went a step further and gave up hypnosis as well. At the present time he treats his patients as follows. Without exerting any other kind of influence, he invites them to lie down in a comfortable attitude on a sofa, while he himself sits on a chair behind them outside their field of vision. He does not even ask them to close their eyes,[1] and avoids touching them in any way, as well as any other procedure which might be reminiscent of hypnosis. The session thus proceeds like a conversation between two people equally awake, but one of whom is spared every muscular exertion and every distracting sensory impression which might divert his attention from his own mental activity.

Since, as we all know, it depends upon the choice of the patient whether or not he can be hypnotized, no matter what the skill of the physician may be, and since a large number of neurotic patients cannot be hypnotized by any means whatever, it followed that with the abandonment of hypnosis the applicability of the treatment was assured to an unlimited number of patients. On the other hand, the widening of consciousness, which had supplied the physician with precisely the psychical material of memories and images [*Vorstellungen*][T] by the help of which the transformation of the symptoms and the liberation of the affects was accomplished, was now missing. Unless a substitute could [251] be produced for this missing element, any therapeutic effect was out of the question.

Freud found such a substitute – and a completely satisfactory one – in the 'associations' [*Einfällen*][T] of his patients; that is, in the involuntary thoughts (most frequently regarded as disturbing elements and

1 [In his account of his procedure given in *The Interpretation of Dreams* (1900*a*), Chapter II; *RSE*, **4**, 90, Freud still recommended that the subject should keep his eyes closed.]

therefore ordinarily pushed aside) which so often break across the continuity of a consecutive narrative.

In order to secure these ideas and associations he asks the patient to 'let himself go' in what he says, 'as you would do in a conversation in which you were rambling on quite disconnectedly and at random'. Before he asks them for a detailed account of their case history he insists that they must include in it whatever comes into their heads, even if they think it unimportant or irrelevant or nonsensical; he lays special stress on their not omitting any thought or idea from their story because to relate it would be embarrassing or distressing to them. In the course of collecting this material of otherwise neglected ideas Freud made the observations which became the determining factor of his entire theory. Gaps appear in the patient's memory even while he narrates his case: actual occurrences are forgotten, the chronological order is confused, or causal connections are broken, with unintelligible results. No neurotic case history is without amnesia of some kind or other. If the patient is urged to fill these gaps in his memory by an increased application of attention, it is noticed that all the ideas which occur to him are pushed back by every possible critical expedient, until at last he feels positive discomfort [*Unbehagen*]^{t} when the memory really returns. From this experience Freud concludes that the amnesias are the result of a process which he calls '*repression*' [*Verdrängung*]^{T} and the motive [*Motiv*]^{T} for which he finds in feelings of unpleasure [*Unlustgefühle*]^{T}. The psychical forces [*Kräfte*]^{T} which have brought about this repression can also be detected, according to him, in the '*resistance*' which operates against the recovery of the lost memories. *Unlust*

The factor of resistance has become one of the cornerstones of his theory. The ideas which are normally pushed aside on every sort of excuse – such as those mentioned above – are regarded by him as derivatives of the repressed psychical phenomena [*Gebilde*]^{T} (thoughts and impulses [*Regungen*]^{T}), distorted owing to the resistance against their reproduction.

The greater the resistance, the greater is the distortion. The value of [252] these unintentional thoughts for the purposes of therapeutic technique lies in this relation of theirs to the repressed psychical material. If one possesses a procedure which makes it possible to arrive at the repressed material from the associations, at the distorted material from the distortions, then what was formerly unconscious in mental life can be made accessible to consciousness even without hypnosis.

Freud has developed on this basis an *art of interpretation* [*Deutungskunst*]^{T} which takes on the task of, as it were, extracting the *Deutung*

pure metal of the repressed thoughts from the ore of the unintentional ideas. This work of interpretation is applied not only to the patient's ideas but also to his dreams, which open up the most direct approach to a knowledge of the unconscious, to his unintentional as well as to his purposeless actions (symptomatic acts) and to the blunders he makes in everyday life (slips of the tongue [*Versprechen*]^{T}, bungled actions [*Vergreifen*]^{T}, and so on). The details of this technique of interpretation or translation [*Übersetzungstechnik*]^{T} have not yet been published by Freud. According to indications he has given, they comprise a number of rules, reached empirically, of how the unconscious material may be reconstructed from the associations, directions on how to know what it means when the patient's ideas cease to flow, and experiences of the most important typical resistances that arise in the course of such treatments. A bulky volume called *The Interpretation of Dreams*, published by Freud in 1900, may be regarded as the forerunner of an initiation into his technique.

Übersetzung

From these remarks on the technique of the psychoanalytic method the conclusion might be drawn that its inventor has given himself needless trouble and has made a mistake in abandoning the less complicated hypnotic mode of procedure. However, in the first place, the technique of psychoanalysis is much easier in practice, when once one has learnt it, than any description of it would indicate; and, secondly, there is no other way which leads to the desired goal, so that the hard road is still the shortest one to travel. The objection to hypnosis is that it conceals the resistance and for that reason has obstructed the physician's insight into the play of psychical forces. Hypnosis does not do away with the resistance but only evades it and therefore yields only incomplete information and transitory therapeutic success.

[253] The task which the psychoanalytic method seeks to perform may be formulated in different ways, which are, however, in their essence equivalent. It may, for instance, be stated thus: the task of the treatment is to remove the amnesias. When all gaps in memory have been filled in, all the enigmatic products of mental life elucidated, the continuance and even a renewal of the morbid condition are made impossible. Or the formula may be expressed in this fashion: all repressions must be undone. The mental condition is then the same as one in which all amnesias have been removed. Another formulation reaches further: the task consists in making the unconscious accessible to consciousness, which is done by overcoming the resistances. But it must be remembered that an ideal condition such as this is not present even in the normal, and further that

it is only rarely possible to carry the treatment to a point approaching it. Just as health and sickness are not different from each other in essence but are only separated by a quantitative line of demarcation which can be determined in practice, so the aim of the treatment will never be anything else but the *practical* recovery of the patient, the restoration of his ability to lead an active life and of his capacity for enjoyment. In a treatment which is incomplete or in which success is not perfect, one may at any rate achieve a considerable improvement in the general mental condition, while the symptoms (though now of smaller importance to the patient) may continue to exist without stamping him as a sick man.

The therapeutic procedure remains the same, apart from insignificant modifications, for all the various clinical pictures that may be presented in hysteria, and all forms of obsessional neurosis [*Zwangsneurose*][T]. This does not imply, however, that it can have an unlimited application. The nature of the psychoanalytic method involves indications and contra-indications with respect to the person to be treated as well as with respect to the clinical picture. Chronic cases of psychoneuroses without any very violent or dangerous symptoms are the most favourable ones for psychoanalysis: thus in the first place every species of obsessional neurosis, obsessive thinking and acting [*Zwangsdenken und Zwangshandeln*], and cases of hysteria in which phobias and abulias play the most important part; further, all somatic expressions of hysteria whenever they do not, as in anorexia, require the physician to attend promptly to the speedy removal of symptoms. In acute cases of hysteria it will be necessary to wait for a calmer stage; in all cases where nervous exhaustion dominates [254]
the clinical picture a treatment which in itself demands effort, brings only slow improvement and for a time cannot take the persistence of the symptoms into account will have to be avoided.

Various qualifications are required of anyone who is to be beneficially affected by psychoanalysis. To begin with, he must be capable of a psychically normal condition; during periods of confusion or melancholic depression nothing can be accomplished even in cases of hysteria. Furthermore, a certain measure of natural intelligence and ethical development are to be required of him; if the physician has to deal with a worthless character, he soon loses the interest which makes it possible for him to enter profoundly into the patient's mental life. Deep-rooted malformations of character, traits of an actually degenerate constitution, show themselves during treatment as sources of a resistance that can scarcely be overcome. In this respect the constitution of the patient sets a general limit to the curative effect of psychotherapy. If the patient's age

is in the neighbourhood of the fifties the conditions for psychoanalysis become unfavourable. The mass of psychical material is then no longer manageable; the time required for recovery is too long; and the ability to undo psychical processes begins to grow weaker.

In spite of all these limitations, the number of persons suitable for psychoanalytic treatment is extraordinarily large and the extension which has come to our therapeutic powers from this method is, according to Freud, very considerable. Freud requires long periods, six months to three years, for an effective treatment; yet he informs us that up to the present, owing to various circumstances which can easily be guessed, he has for the most part been in a position to try his treatment only on very severe cases: patients have come to him after many years of illness, completely incapacitated for life, and, after being disappointed by all kinds of treatments, have had recourse as a last resort to a method which is novel and has been greeted with many doubts. In cases of less severe illness the duration of the treatment might well be much shorter, and very great advantage in the direction of future prevention might be achieved.

REVIEW OF LÖWENFELD'S *PSYCHICAL COMPULSIVE PHENOMENA* (1904)

EDITORS' NOTE

REVIEW OF L. LÖWENFELD, *DIE PSYCHISCHEN ZWANGSERSCHEINUNGEN*

GERMAN EDITIONS

1904 *J. Psychol. Neurol.*, **3** (4), 190–1.
1987 *GW*, **Nachtr.**, 496–9.

ENGLISH TRANSLATION

'An unknown review by Freud'
1967 *Int. J. Psycho-Anal.*, **48**, 319–20. (Tr. J. Strachey.)

The present translation is a substantially revised version of the one printed in 1967.

This forgotten review by Freud was unearthed by Professor Saul Rosenzweig of Washington University, St Louis, Missouri, too late for inclusion in the *SE*.

The book under review is of historical interest insofar as it contained the first announcement in print of Freud's renunciation of the 'seduction hypothesis' (see *RSE*, **1**, 278 *n*. 2, and p. 113 *n*. above). The book actually contained an essay by Freud himself, 'Freud's Psychoanalytic Procedure' (1904*a*), p. 223 ff. above. Here, however, Freud goes back further to his 'Reply to Criticisms of my Paper on Anxiety Neurosis' (1895*f*), *RSE*, **3**, 109 ff., which was largely concerned with objections raised by Löwenfeld. The present review is, in fact, little more than a summary of some of the points made in Freud's earlier paper.

Leopold Löwenfeld (1847–1923) was a well-known psychiatrist, practising in Munich. He attended the first two International Psychoanalytical Congresses, in 1908 and 1910, but never fully accepted Freud's ideas. In spite of this, however, he remained on friendly terms with Freud, a fact which Freud commented on in Lecture XVI of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 216–17.

REVIEW OF LÖWENFELD'S *PSYCHICAL COMPULSIVE PHENOMENA*

This work by Löwenfeld which, under the title *Psychical Compulsive Phenomena*,[1] deals with a considerable portion of the clinical aspects and symptomatology of the neuroses again combines all the merits that have made the comprehensive exegeses of this Munich neuropathologist so valuable, indeed indispensable, to his fellow specialists. The quite extraordinary mastery of the literature on the subject, the wealth of personal observations, and the clarity of style should not, however, allow the reader to forget that the chief value of the work lies not in these characteristics of a compiler, but rather in the impartially considered criticism and in the thoroughly independent conception of the author. What seems to me to be particularly commendable is that Löwenfeld did not direct his efforts to the presentation of a subject that has already been dealt with countless times before, but rather has tackled the examination and organization of a still little-researched area.

The difficulties which confront the investigator under such circumstances are of an uncommon sort. All definitions are shaky and no agreement has been achieved as to the [nosological] delimitations. What Löwenfeld deals with as 'psychical compulsion' [*Zwang*][T] extends far beyond the bounds of so-called obsessional pathology [*Zwangsvorstellungskrankheit*] and incorporates the phobias, an aspect of the abulias, all neurotic anxiety states, and also attacks of 'free-floating'[2] anxiety. This is an unexpected bonus for the reader of the book, but it makes it impossible for the author to say anything generally applicable about the mechanism, aetiology and course of 'psychical compulsive phenomena', for these affections – widely disparate in their nature – are far apart in regard to all of these factors as well.

Löwenfeld holds together his unity (in this reviewer's opinion, an artificial one) by his definition of the psychical compulsions – 'immobility, deficient susceptibility to repression through the influence of the will'

1 [*Die psychischen Zwangserscheinungen*. Wiesbaden: J. F. Bergmann, 1904.]

2 ['*inhaltsloser Angst*[T]. Literally anxiety 'without content'.]

is considered to be their fundamental characteristic. However, he also recognizes (certainly with justification) compulsive sensations and compulsive affects, whereas we are accustomed to demand from the normal activity of our will the repression [*Verdrängung*][T] only of ideas [*Vorstellungen*][T] and ideational complexes, not the nullification of sensations or feelings as well. Anyone who suffers from an anxiety attack is liable to complain that he 'feels so bad', but will not be surprised that he cannot get rid of a 'compulsion'. Incidentally, with consistent application of his criteria, the author would also have had to deal with a good part of hysterical symptomatology, which befits the characteristic of 'immobility, deficient susceptibility to repression through the influence of the will', in a most pronounced way.

It was therefore perhaps not expedient to use the concept of 'compulsion' in its logical sense for purposes of [nosographic] delimitation. It is, however, difficult at present to put something better in its place. In reality, it is easier to suspect and, on the basis of certain signs, to guess at the internal difference of the affections combined by the author than to lay it bare. The correct distinctions might only reveal themselves once the psychological mechanisms of the individual forms are more accurately known. At the centre of all questions concerning the interpretation of compulsive phenomena lies the problem of neurotic anxiety. If the source of this anxiety and the conditions under which it arises were elucidated, the key to an understanding of the psychoneuroses would be found. This reviewer can only regret that the author has once again not accepted the formula proposed by him (the reviewer), which states that neurotic anxiety is somatic in origin, has its source in sexual life,[1] and corresponds to a transformed libido. The reviewer attempted on a previous occasion [1895][2] to demonstrate the correctness, or at least the heuristic value, of this proposal on the example of his 'anxiety neurosis'. Löwenfeld raises the objection to this derivation of anxiety that he cannot detect sexual noxae in the aetiology of all cases of anxiety neurosis, but in only approximately 75 per cent. The reviewer accepts this figure, but he would like to defend himself against the implicit reproach that he became blinded to observation for the sake of theory. The reviewer recognized and acknowledged the cases of anxiety neurosis without sexual aetiology in 1895 already, for he expressly stated in the paper on anxiety neurosis cited above: 'The last of the aetiological conditions I have to bring forward appears at first sight not to be of a sexual nature at all.

1 [This last phrase was – no doubt inadvertently – omitted in Strachey's (1967) translation.]

2 [Square brackets in the original.]

Anxiety neurosis also arises – and in both sexes – as a result of the factor of overwork or exhausting exertion – as, for instance, after nightwatching, sick-nursing, or even after severe illness.' [*RSE*, **3**, 92.] Critics are in the habit of overlooking this passage in the interests of simplification.

If the theory of this reviewer nevertheless derives neurotic anxiety quite generally from the libido [i.e. in these cases as well],[1] then it seems inevitable that there has been either an inconsistency on his part, or a misunderstanding on the part of his critics. It is not difficult to demonstrate the latter. The reviewer has drawn a sharp conceptual distinction between aetiology and mechanism, which is something that his critics do not do. He believes that, in anxiety neurosis, a sexual noxa is not invariably the *aetiology* of a case of the illness, but that the *mechanism* of the disturbance does affect sexuality quite regularly. This distinction leads to the (certainly not implausible) assumption that the sexual-organic process can just as easily be disturbed by noxae from sexual life itself as by deep-reaching general noxae – similar to, for example, the process of digestive activity, which can be pathologically modified by ingestion on the one hand, and by general toxic diseases, cachexias and haemological changes, on the other.

The reviewer is also familiar with the cases of anxiety neurosis, cited against him by Löwenfeld, which present with a considerable increase, as opposed to a diminution, of the libido; but he knows that they represent nothing other than an oscillation between libidinal excitation [*Erregung*][T] and excitation (partly) transformed into anxiety.

Further, Löwenfeld emphasizes fright and other emotional noxae among the causes of anxiety neurosis. The reviewer must insist, in accordance with the results of his investigations, that these cases (which occur very frequently) amount in every respect to hysterical reactions, and are therefore classifiable with that neurosis.

It is impossible to convey within the framework of a review what an abundance of contributions and challenges are contained in Löwenfeld's book on psychical compulsive phenomena. It is to be hoped that its publication will result in an extraordinary increase of interest in these remarkable forms of illness of practical significance.

PSYCHISCHE BEHANDLUNG (SEELENBEHANDLUNG)

GERMAN EDITIONS

1905 In *Die Gesundheit*, ed. R. Kossmann & J. Weiss, 1st ed., **1**, 368–84. Stuttgart, Berlin & Leipzig: Union Deutsche Verlagsgesellschaft. (1918/19, 2nd ed.) [282]
1937 *Zeitschr. psychoanal. Pädagogik*, **11**, 133–47.
1942 *GW*, **5**, 289–315.
1975 *SA*, **Erg.**, 13–35.

ENGLISH TRANSLATION

'Psychical (or Mental) Treatment'
1953 *SE*, **7**, 283–302. (Tr. James Strachey.)

The present translation is a revised and corrected reprint of the *SE* version.

Die Gesundheit was a collective work on medicine of a semi-popular character in two volumes with a large number of collaborators. In a letter to Pfister of June 17, 1910 (1963*a*) Freud says: 'The book which I put in my children's hands is a popular medical work, *Die Gesundheit*, to which I myself contributed. It is quite dry and factual.' Freud's contribution formed part of a section dealing with various methods of treatment.

In the first volume of the *SE* (which was published in 1966, thirteen years after the seventh volume) Strachey declared that he had mistakenly assigned this paper to the year 1905 – and therefore to the seventh volume. He explained that Professor Saul Rosenzweig of Washington University had subsequently discovered two earlier editions of Kossmann & Weiss's *Die Gesundheit*, the book in which 'Psychical (or Mental) Treatment' was originally published, dated 1890 and 1900 respectively. On this basis Strachey recommended that the article be redated and removed to the first volume of the *SE*, 'where it properly belongs'.

Rosenzweig's discovery neatly accounted for the curious fact that an article by Freud devoted to the state of the art of mental treatment in 1905 should centre on hypnotism, and make no mention of Freud's own discoveries apart from a possible obscure hint at cathartic treatment. The word 'psychoanalysis', which Freud first used publicly in 1896, also does not appear in this article. More recent research by Gerhard Fichtner (2007), however, has revealed that the earlier editions discovered

by Rosenzweig were illusory – products of a librarian's error. The mystery surrounding the precise date of composition of the 1905 article therefore remains. Fichtner now suggests (on textual grounds) that it was written sometime between 1894 and 1895, and that publication was delayed by the editors, probably due to the rapid advances that were occurring in various medical fields during the intervening period.

An important additional outcome of Fichtner's research into the provenance of this article was his discovery that Freud had after all substantially updated it for a revised edition of *Die Gesundheit*. This second edition was not published in 1900, as Rosenzweig had thought, but rather in 1918/19. (Freud may have forgotten that he had updated the article, as in 1937 he permitted the 1905 version to be reprinted – unaltered – in the *Zeitschrift für psychoanalytische Pädagogik*.)

The 1918/19 addendum to the original article is published here, for the first time in English translation, in the form of an Appendix.

PSYCHICAL (OR MENTAL) TREATMENT

'Psyche' is a Greek word which may be translated 'mind' [*Seele*].[1] Thus [283]
'psychical treatment' ['*psychische Behandlung*'] means 'mental treatment' ['*Seelenbehandlung*']. The term might accordingly be supposed to signify 'treatment of the pathological phenomena of mental life' [*Seelenlebens*]. This, however, is *not* its meaning. 'Psychical treatment' denotes, rather, treatment taking its start in the mind, treatment (whether of mental or physical disorders) by measures which operate in the first instance and immediately upon the human mind.

Foremost among such measures is the use of words; and words are the essential tool of mental treatment. A layman will no doubt find it hard to understand how pathological disorders of the body and mind can be eliminated by 'mere' words. He will feel that he is being asked to believe in magic. And he will not be so very wrong, for the words which we use in our everyday speech are nothing other than watered-down magic. But we shall have to follow a roundabout path in order to explain how science sets about restoring to words a part at least of their former magical power.

It is only comparatively recently, too, that physicians with a scientific training have learnt to appreciate the value of mental treatment. And we can easily see why this was so when we reflect on the evolution of medicine during the last half-century. After a somewhat unfruitful period during which it was dependent on what was known as 'Philosophy of Nature',[2] it came under the happy influence of the natural sciences and has achieved the greatest advances alike as a science and as an art: it has shown that the organism is built up from microscopically small elements (the cells), it has learnt to understand the physics and chemistry of the various vital processes (functions), it has distinguished the visible and observable modifications which are brought about in the bodily organs

1 [A German word which is in fact nearer to the Greek 'psyche' than is the English 'mind'.][T] *Seele*

2 [This was a school of thought of a pantheistic type, associated chiefly with the name of Schelling, which was predominant in Germany during the first half of the nineteenth century. Cf. Bernfeld, 1944.]

[284] by different morbid processes, and has discovered, on the other hand, the signs that reveal the operation of deep-lying morbid processes in the living body; moreover, it has identified a great number of the micro-organisms which cause illness and, with the help of its newly acquired knowledge, it has reduced to a quite extraordinary degree the dangers arising from severe surgical operations. All of these advances and discoveries were related to the *physical* side of man, and it followed, as a result of an incorrect though easily understandable trend of thought, that physicians came to restrict their interest to the physical side of things and were glad to leave the mental field to be dealt with by the philosophers whom they despised.

Modern medicine, it is true, had reason enough for studying the indisputable connection between the body and the mind; but it never ceased to represent mental events as determined by physical ones and dependent on them. Thus stress was laid on the fact that intellectual [*geistigen*] functioning was conditional upon the presence of a normally developed and sufficiently nourished brain, that any disease of that organ led to disturbances of intellectual functioning, that the introduction of toxic substances into the circulation could produce certain states of mental illness [*Geisteskrankheit*], or – to descend to more trivial matters – that dreams could be modified by stimuli brought to bear upon a sleeper for experimental purposes.[1]

The relation between body and mind (in animals no less than in human beings) is a reciprocal one; but in earlier times the other side of this relation, the effect of the mind upon the body, found little favour in the eyes of physicians. They seemed to be afraid of granting mental life any independence, for fear of that implying an abandonment of the scientific ground on which they stood.

This one-sided attitude of medicine towards the body has undergone a gradual change in the course of the last decade and a half, a change brought about directly by clinical experience. There are a large number of patients, suffering from affections of greater or lesser severity, whose disorders and complaints make great demands on the skill of their physicians, but in whom no visible or observable signs of a pathological
[285] process can be discovered either during their life or after their death, in spite of all the advances in the methods of investigation made by scientific medicine. One group of these patients are distinguished by the copiousness and variety of their symptoms: they are incapable of

1 [Cf. *The Interpretation of Dreams* (Freud, 1900*a*), Chapter I, Section C (1); *RSE*, **4**, 22 f.]

intellectual [*geistig*] work because of headaches or inability to concentrate their attention, their eyes ache when they read, their legs become fatigued when they walk, develop dull pains or go to sleep, their digestion is disturbed by distressing sensations, by eructations or gastric spasms, they cannot defaecate without aperients, they are subject to sleeplessness, and so on. They may suffer from all these disorders simultaneously or in succession, or from only a selection of them; but in every case the illness is evidently the same. Moreover, its signs are often variable and replace one another. A patient who has hitherto been incapacitated by headaches but has had a fairly good digestion may next day enjoy a clear head but may thenceforward be unable to manage most kinds of food. Again, his sufferings may suddenly cease if there is a marked change in the circumstances of his existence. If he is travelling he may feel perfectly well and be able to enjoy the most varied diet without any ill-effects, but when he gets home he may once more have to restrict himself to sour milk. In a few cases the disorder – whether it is a pain or a weakness resembling a paralysis – may suddenly pass from one side of the body to the other: it may jump from his right side to the corresponding part of the body on his left side. But in every instance it is to be observed that the symptoms are very clearly influenced by excitement, emotion, worry, etc., and also that they can disappear and give place to perfect health without leaving any traces, even if they have persisted over a long period.

Medical research has at last shown that people of this kind are not to be looked upon as suffering from a disease of the stomach or of the eyes or whatever it may be, but that it must be a question in their case of an illness of the nervous system as a whole. Examination of the brain and nerves of these patients has so far, however, revealed no perceptible changes; and, indeed, some of the features of their symptomatology prohibit any expectation that even more accurate methods of investigation could ever discover changes of a sort that would throw light upon the illness. This condition has been described as 'nervousness' (neurasthenia or hysteria) and has been characterized as a merely 'functional' [286]
disorder of the nervous system.[1] Incidentally, an exhaustive examination of the brain (after the patient's death) has been equally without results in the case of many more permanent nervous disorders, as well as in illnesses with exclusively mental symptoms, such as what are known as obsessions, delusions and insanity [*Zwangsideen*, *Wahnideen*, *Verrücktheit*].

1 See Volume II [Part X, Chapter 4] of the work, *Die Gesundheit* [in which this paper of Freud's first appeared].

Physicians were thus faced with the problem of investigating the nature and origin of the symptoms shown by these nervous or neurotic patients. In the course of this investigation it was found that in some at least of these patients the signs of their illness originate from nothing other than *a change in the action of their minds upon their bodies* and that the immediate cause of their disorder is to be looked for in their minds. What may be the remoter causes of the disturbance which affects their minds is another question, with which we need not now concern ourselves. But medical science was here provided with an opportunity for directing its full attention to what had previously been the neglected side of the mutual relation between body and mind.

It is not until we have studied pathological phenomena that we can get an insight into normal ones. Many things which had long been known of the influence of the mind on the body were only now brought into their true perspective. The commonest, everyday example of the mind's action on the body, and one that is to be observed in everyone, is offered by what is known as the 'expression of the emotions'. A man's states of mind are manifested, almost without exception, in the tensions and relaxations of his facial muscles, in the adaptations of his eyes, in the amount of blood in the vessels of his skin, in the modifications in his vocal apparatus and in the movements of his limbs and in particular of his hands. These concomitant physical changes are for the most part of no advantage to the person concerned; on the contrary, they often stand in his way if he wishes to conceal his mental processes from other people. But they serve these other people as trustworthy indications from which his mental processes can be inferred and in which more confidence can be placed than in any simultaneous verbal expressions
[287] that may be made deliberately.[1] If we are able to submit anyone to a more accurate examination during certain of his mental activities, we come upon further physical consequences, in the shape of changes in his heart action, alterations in the distribution of blood in his body, and so on.

In certain mental states described as 'affects', the part played by the body is so obvious and on so large a scale that some psychologists have even adopted the view that the essence of these affects consists only in their physical manifestations. It is a matter of common knowledge that extraordinary changes occur in the facial expression, in the circulation, in the excretions and in the state of tension [*Erregungszuständen*] of the

1 [Cf. the example in the case of 'Dora' (1905*e*), p. 67 f. above.]

voluntary muscles under the influence of fear, of rage, of mental pain and of sexual delight. What is less well known, though equally well established, is the occurrence of other physical results of the affects which cannot be counted as their expression. Persistent affective states of a distressing or 'depressive' nature (as they are called), such as sorrow, worry or grief [*Trauer*], reduce the state of nourishment of the whole body, cause the hair to turn white, the fat to disappear and the walls of the blood vessels to undergo morbid changes. On the other hand, under the influence of feelings of joy, of 'happiness', we find that the whole body blossoms out and shows signs of a renewal of youth. The major affects evidently have a large bearing on the capacity to resist infectious illness; a good example of this is to be seen in the medical observation that there is a far greater liability to contract such diseases as typhus and dysentery in defeated armies than in victorious ones. The affects, moreover – this applies almost exclusively to depressive affects – are often sufficient in themselves to bring about both diseases of the nervous system accompanied by manifest anatomical changes and also diseases of other organs. In such cases it must be assumed that the patient [*betreffende Person*]^{T} already had a predisposition, though hitherto an inoperative one, to the disease in question. *Person*

States of illness that are already present can be very considerably influenced by violent affects. Such changes are usually for the worse; but there is no lack of instances in which a severe shock [*Schreck*] or a sudden bereavement brings about a peculiar alteration in the tone of the organism which may have a favourable influence on some well-established pathological condition or may even bring it to an end. Finally, there can be no doubt that the duration of life can be appreciably shortened by depressive affects and that a violent shock, or a deep humiliation or disgrace, may put a sudden end to life. Strange to say, this same result may be found to follow too from the unexpected impact of a great joy. [288]

The affects in the narrower sense are, it is true, characterized by a quite special connection with somatic processes; but, strictly speaking, all mental states, including those that we usually regard as 'processes of thought', are to some degree 'affective', and not one of them is without its physical manifestations or is incapable of modifying somatic processes. Even when a person is engaged in quietly thinking in a string of 'ideas' [*Vorstellungen*]^{T} there are a constant series of excitations, corresponding to the content of these ideas, which are discharged [*abgeleitet*]^{T} into the smooth or striated muscles. These excitations can be made apparent if they are appropriately reinforced, and certain striking and, *ableiten*

indeed, ostensibly 'supernatural' phenomena can be explained by this means. Thus, what is known as 'thought reading' [*Gedankenerraten*] may be explained by small, involuntary muscular movements carried out by the 'medium' in the course of an experiment – when, for instance, he has to make someone discover a hidden object [without giving any ostensible prompting]. The whole phenomenon might more suitably be described as 'thought betraying' [*Gedankenverratens*].

The processes of volition and attention are also capable of exercising a profound effect on somatic processes and of playing a large part in promoting or hindering physical illnesses. A famous English physician has reported that he can succeed in producing a great variety of sensations and pains in any part of his body to which he may choose to direct his attention, and the majority of people appear to behave similarly. It is in general true that in forming a judgement of pains (which are usually regarded as physical phenomena) we must bear in mind their unmistakable dependence upon mental determinants. Laymen, who like to sum up mental influences of this kind under the name of 'imagination' [*Einbildung*], are inclined to have little respect for pains that are due to imagination as contrasted with those caused by injury, illness or inflammation. But this is clearly unjust. However pains may be caused – even by imagination – they themselves are no less real and no less violent on that account.

[289] Just as pains are produced or increased by having attention paid to them, so, too, they disappear if attention is diverted from them. This experience can always be employed as a means of soothing children; adult soldiers do not feel the pain of a wound in the feverish heat of battle; martyrs are probably quite impervious to the pain of their tortures in the overexcitement of their religious feeling and in the concentration of all their thoughts upon the heavenly reward that awaits them. It is not so easy to produce evidence of the influence of *volition* on pathological somatic processes; but it is quite possible that a determination to recover or a will to die may have an effect on the outcome even of severe and precarious illnesses.

Our interest is most particularly engaged by the mental state of *expectation*, which puts in motion a number of mental forces [*Kräfte*][T] that have the greatest influence on the onset and cure of physical diseases.

Angst *Fearful* [*ängstliche*][T] expectation is certainly not without its effect on the result. It would be of importance to know with certainty whether it has as great a bearing as is supposed on falling ill; for instance, whether it is

true that during an epidemic those who are afraid of contracting the illness are in the greatest danger. The contrary state of mind, in which expectation is coloured by hope and faith, is an effective force with which we have to reckon, strictly speaking, in *all* our attempts at treatment and cure. We could not otherwise account for the peculiar results which we find produced by medicaments and therapeutic procedures.

The most noticeable effects of this kind of expectation coloured by faith are to be found in the 'miraculous' cures which are brought about even today under our own eyes without the help of any medical skill. Miraculous cures properly so called take place in the case of believers under the influence of adjuncts calculated to intensify religious feelings – that is to say, in places where a miracle-working image is worshipped, or where a holy or divine personage has revealed himself to men and has promised them relief from their sufferings in return for their worship, or where the relics of a saint are preserved as a treasure. Religious faith alone does not seem to find it easy to suppress[I] illness by means of expectation; for as a rule other contrivances as well are brought into play in the case of miraculous cures. The times and seasons at which divine mercy is sought must be specially indicated; the patient must submit to [290]
physical toil, to the trials and sacrifices of a pilgrimage, before he can become worthy of this divine mercy.

It would be convenient, but quite wrong, simply to refuse all credence to these miraculous cures and to seek to explain the accounts of them as a combination of pious fraud and inaccurate observation. Though an explanation of this kind may often be justified, it is not enough to enable us to dismiss entirely the fact of miraculous cures. They do really occur and have occurred at every period of history. And they concern not merely illnesses of mental origin – those, that is, which are based on 'imagination' and are therefore likely to be especially affected by the circumstances of a pilgrimage – but also illnesses with an 'organic' basis which had previously resisted all the efforts of physicians.

There is no need, however, to bring forward anything other than mental forces [*Mächte*] in order to explain miraculous cures. Even under conditions such as these, nothing happens that can be considered as beyond our understanding. Everything proceeds naturally. Indeed, the power [*Macht*] of religious faith is reinforced in these cases by a number of eminently human driving forces [*Triebkräfte*][T]. The individual's pious belief is intensified by the enthusiasm of the crowd of people in whose

1 [In the original: '*verdrängen*', usually translated 'repress'. This paper probably dates, however, from the 1890s – before the idea of repression played any part in Freud's ideas.]

midst he makes his way as a rule to the sacred locality. All the mental impulses [*Regungen*][T] of an individual can be enormously magnified by group influence such as this. In cases in which someone proceeds to the holy place by himself, the reputation of the place and the respect in which it is held act as substitutes for the influence of the group, so that, in fact, the power of a group is once more in operation. And there is yet another way in which this influence makes itself felt. Since it is well known that divine mercy is always shown to only a few of the many who seek it, each of these is eager to be among the chosen few; the ambition that lies hidden in everyone comes to the help of pious faith. Where so many powerful forces [*Kräfte*] converge, we need feel no surprise if the goal is sometimes really reached.

Even those who are without religious faith need not forgo miraculous cures. In their case reputation and group influence act as a complete substitute for faith. There are always fashionable treatments and fashionable physicians, and these play an especially dominant part in high society,
[291] where the most powerful psychological driving forces are the endeavour to excel and to do what the 'best' people do. Fashionable treatments of this kind produce therapeutic results which are outside the scope of their actual power, and the same procedures effect far more in the hands of a fashionable doctor (who, for instance, may have become well known as an attendant upon some prominent personality) than in those of another physician. Thus there are human as well as divine miracle-workers. Such men, however, who have reached eminence owing to the favour of fashion and of imitation, soon lose their power, as is to be expected from the nature of the forces [*Mächte*] which give it to them.

An intelligible dissatisfaction with the frequent inadequacy of the help afforded by medical skill, and perhaps, too, an internal rebellion against the duress [*Zwang*][T] of scientific thought, which reflects the remorselessness of nature, have in all periods (and in our own once more) imposed a strange condition on the therapeutic powers alike of persons and of procedures. The necessary faith emerges only if the practitioner is not a doctor, if he can boast of having no knowledge of the scientific basis of therapeutics, if the procedure has not been subjected to accurate testing but is recommended by some popular prejudice. Hence it is that we find a swarm of 'natural cures' and 'natural healers', who compete with physicians in the exercise of their profession and of whom we can at least say with some degree of certainty that they do far more harm than good. If this gives us grounds for blaming the patients' faith, we must yet not be so ungrateful as to forget that the same force is constantly at work in

support of our own medical efforts. The results of every procedure laid down by the physician and of every treatment that he undertakes are probably composed of two portions. And one of these, which is sometimes greater and sometimes lesser, but can never be completely disregarded, is determined by the patient's mental attitude. The faith with which he meets the immediate effect of a medical procedure depends on the one hand on the amount of his own desire to be cured, and on the other hand on his confidence that he has taken the right steps in that direction – on his general respect, that is, for medical skill – and, further, on the power which he attributes to his doctor's personality, and even on the purely human liking aroused in him by the doctor. There are some physicians who have a greater capacity than others for winning their patients' confidence; a patient will often feel better the very moment the doctor enters his room. [292]

Physicians have practised mental treatment from the beginning of time, and in early days to a far greater extent even than today. If by mental treatment we mean an endeavour to produce such mental states and conditions in the patient as will be the most propitious for his recovery, this kind of medical treatment is historically the oldest. Psychical treatment was almost the only sort at the disposal of the peoples of antiquity, and they invariably reinforced the effects of therapeutic potions and other therapeutic measures by intensive mental treatment. Such familiar procedures as the use of magical formulas and purificatory baths, or the elicitation of oracular dreams by sleeping in the temple precincts, can only have had a curative effect by psychical means. The physician's personality acquired a reputation derived directly from divine power, since in its beginnings the art of healing lay in the hands of priests. So that then as now the physician's personality was one of the chief instruments for bringing the patient into a state of mind favourable for his recovery.

Now, too, we begin to understand the 'magic' of words. Words are the most important media by which one man seeks to bring his influence to bear on another; words are a good method of producing mental changes in the person to whom they are addressed. So that there is no longer anything puzzling in the assertion that the magic of words can remove the symptoms of illness, and especially such as are themselves founded on mental states.

All the mental influences which have proved effective in curing illnesses have something incalculable about them. Affects, concentration of the will, distracting the attention, expectation coloured by faith – all

of these forces, which occasionally remove an illness, sometimes fail to do so without there being anything in the character of the illness to account for the different result. What stands in the way of regularity in the therapeutic results achieved is evidently the autocratic nature of the personalities of the subjects, with their variety of mental differences. Since physicians came to realize clearly the important part played in recovery by the patient's state of mind, the idea naturally occurred to
[293] them of no longer leaving it to the patient to decide how much mental compliance he should show but of deliberately imposing a propitious state of mind by suitable methods. It is from this attempt that modern mental treatment has taken its start.

Quite a number of different methods of treatment have thus arisen, some of them simple to arrive at and others which could only be reached on the basis of complex hypotheses. It is easy to see, for instance, that the physician, who can no longer command respect as a priest or as the possessor of secret knowledge, should use his personality in such a way as to gain his patient's confidence and, to some degree, his affection. He himself may succeed in doing this with only a limited number of patients, whereas other patients, according to their inclinations and degree of education, will be attracted to other physicians. Such a distribution will serve a useful purpose; but *if the right of a patient to make a free choice of his doctor were suspended, an important precondition for influencing him mentally would be abolished*.

There are many very effective mental procedures which the physician is obliged to renounce. He either has not the power or has not the right to invoke them. This applies in particular to the provocation of strong affects – the most powerful of all the means by which the mind affects the body. The vicissitudes [*Schicksal*][T] of life often cure illnesses through the experience of great joy, through the satisfaction of needs or the fulfilment of wishes. The physician, who is often impotent outside his profession, cannot compete along these lines. It might be more within his power to employ fear [*Furcht*] and fright [*Schrecken*] for therapeutic ends; but, except in the case of children, he must have the gravest doubts about the use of such double-edged tools. On the other hand, the physician must rule out any relations with his patient that are bound up with tender feelings, owing to their implications in practical life. Thus from the first his power to bring about mental changes in his patients seems so restricted that mental treatment conducted on a deliberate plan would seem to offer no advantages over the earlier haphazard method.

The physician can seek to direct his patient's volition and attention, and he has good grounds for doing so in the case of various pathological conditions. He may, for instance, persistently oblige a person who believes he is paralysed to carry out the movements of which he professes himself incapable; or he may refuse to fall in with the wishes of an [294] anxious patient who insists on being examined for an illness from which he is quite certainly not suffering. In these instances the physician will be taking the right course, but such isolated cases would scarcely justify us in setting up mental treatment as a special therapeutic procedure. There exists, nevertheless, a peculiar and unforeseeable method which offers the physician a possibility of exercising a profound, even though transitory, influence on the mental life of his patients and of employing that influence for therapeutic purposes.

It has long been known, though it has only been established beyond all doubt during the last few decades, that it is possible, by certain gentle means, to put people into a quite peculiar mental state very similar to sleep and on that account described as 'hypnosis'. The various means by which hypnosis can be brought about have at first sight little in common. It is possible to hypnotize someone by getting him to stare fixedly at a bright object for some minutes, or by holding a watch to his ear for a similar length of time, or by repeatedly passing the open hands, at a short distance away, over his face and limbs. But the same result can be brought about by describing the onset of the state of hypnosis and its characteristics quietly and firmly to the subject – that is, by 'talking him into' hypnosis. The two procedures may also be combined. We may make the subject [*Person*] sit down, hold a finger in front of his eyes, tell him to gaze at it fixedly and then say to him: 'You're feeling tired. Your eyes are closing; you can't hold them open. Your limbs are heavy; you can't move them any more. You're falling asleep—' and so on. It will be observed that all the procedures have in common a fixing of the attention; in those first mentioned the attention is fatigued by slight and monotonous sensory stimuli. It is not yet satisfactorily explained, however, how it comes about that mere talking produces exactly the same state as the other procedures. Experienced hypnotists assert that by these means a definite hypnotic change can be brought about in some eighty per cent of subjects. There is no way of telling beforehand, however, which subjects are hypnotizable and which are not. Illness is far from being one of the necessary preconditions of hypnosis: normal people are said to be particularly easy to hypnotize, while some neurotics can only

[295] be hypnotized with great difficulty and the insane are completely resistant. The hypnotic state exhibits a great variety of gradations. In its lightest degree the hypnotic subject is aware only of something like a slight insensibility, while the most extreme degree, which is marked by special peculiarities, is known as 'somnambulism', on account of its resemblance to the natural phenomenon of sleepwalking. But hypnosis is in no sense a sleep like our nocturnal sleep or like the sleep produced by drugs. Changes occur in it and mental functions are retained during it which are absent in normal sleep.

Some of the phenomena of hypnosis (for instance, alterations in muscular activity) possess a merely scientific interest. But the most significant indication of hypnosis, and the most important one from our point of view, lies in the hypnotic subject's attitude to his hypnotist. While the subject behaves to the rest of the external world as though he were asleep, that is, as though all his senses were diverted from it, he is *awake* in his relation to the person who hypnotized him; he hears and sees him alone, and him he understands and answers. This phenomenon, which is described as *rapport* in the case of hypnosis, finds a parallel in the way in which some people sleep – for instance, a mother who is nursing her baby.[1] It is so striking that it may well lead us to an understanding of the relation between the hypnotic subject and the hypnotist.

But the fact that the subject's universe is, so to say, confined to the hypnotist is not the whole story. There is the further fact of the former's *docility* in relation to the latter: he becomes obedient and credulous – in the case of deep hypnosis, to an almost unlimited extent. And the manner in which this obedience and credulity are carried out reveals a characteristic of the hypnotic state, namely that in the hypnotized subject the influence of the mind over the body is extraordinarily increased. If the hypnotist says 'You can't move your arm', the arm drops motionless; the subject obviously tries with all his strength but is unable to move it. If the hypnotist says: 'Your arm's moving of its own accord, you can't stop it', the arm moves and the subject is seen making vain efforts to keep it still. The idea which the hypnotist has given to the subject by his words
[296] has produced in him precisely the mental-physical behaviour corresponding to the idea's content. This implies on the one hand obedience but on the other an increase in the physical influence of an idea. Words have once more regained their magic.

1 [Cf. various remarks on this subject in *The Interpretation of Dreams* (Freud, 1900*a*), e.g. in Chapter V, Section C; *RSE*, **4**, 198.]

The same thing happens in the domain of sense perceptions. The hypnotist says: 'You see a snake; you're smelling a rose; you're listening to the loveliest music', and the hypnotic subject sees, smells and hears what is required of him by the idea that he has been given. How do we know that the subject really has these perceptions? It might be thought that he is only pretending to have them. But after all we have no reason for doubts on the point; for he behaves exactly as though he had them, he expresses all the appropriate emotions, and in some circumstances he can even describe his imaginary perceptions and experiences after the hypnosis is at an end. We then perceive that he has been seeing and hearing just as we see and hear in dreams – he has been 'hallucinating'. He was evidently so credulous in relation to the hypnotist that he was *convinced* that there must be a snake to be seen when the hypnotist told him so; and this conviction had such a strong effect on his body that he really saw the snake – a thing which, incidentally, can sometimes happen even to people who have not been hypnotized.

It may be remarked, by the way, that, outside hypnosis and in real life, credulity such as the subject has in relation to his hypnotist is shown only by a child towards his beloved parents, and that an attitude of similar subjection on the part of one person towards another has only one parallel, though a complete one – namely in certain love relationships where there is extreme devotion. A combination of exclusive attachment and credulous obedience is in general among the characteristics of love.[1]

Some further points may be mentioned in connection with the state of hypnosis. The words spoken by the hypnotist which have the magical results that I have described are known as a 'suggestion' and it has become customary to apply the term as well where there is merely an intention to produce a similar effect.[2] Not only do the hypnotic subject's [297] movements and feelings obey suggestions, but all his other mental activities; and he does not as a rule take any action on his own initiative. Hypnotic obedience can be employed in making a number of highly remarkable experiments, which afford a deep insight into the workings of the mind and produce in the observer an ineradicable conviction of the unsuspected power of the mind over the body. Just as a hypnotized subject can be obliged to see what is not there, so he can be forbidden to

1 [Freud returned to this topic many years later, in Chapter VIII of his *Group Psychology* (1921*c*), *RSE*, **18**, 103.]

2 [In French and English the technical use of the term 'suggestion' was, of course, derived from the everyday use of the word. In German the process was reversed, since '*Suggestion*' was first imported into German in its technical sense and only subsequently acquired a wider meaning.]

see what *is* there and is seeking to impress itself on his senses – some particular person, for instance. (This is known as a 'negative hallucination'.) The person in question then finds it impossible to attract the subject's attention by any kind of stimulation; he is treated as though he were 'thin air'. Again, a suggestion may be made to the subject to carry out some action a certain length of time after waking from hypnosis ('post-hypnotic suggestion'); the subject keeps to the allotted time and performs the suggested action in the middle of his waking state without being able to give any reason for it. If he is asked why he has done what he has, either he will refer to an obscure impulse [*Drang*] which he was unable to resist, or he will invent some half-satisfactory excuse without remembering the real explanation – namely the suggestion he has been given.

The state of hypnosis is brought to an end without any difficulty by the hypnotist's authority asserted in the words: 'Wake up!' After the deepest hypnosis there is no recollection of anything that has been experienced during it under the hypnotist's influence. That portion of the subject's mental life remains cut off, as it were, from the rest. Other subjects retain a dreamlike memory, and yet others remember everything but report that they have been under an irresistible mental compulsion [*Zwang*].

The scientific gain brought to physicians and psychologists by a knowledge of the facts of hypnotism can scarcely be exaggerated. But in order
[298] to gauge the practical importance of the new discoveries we must put a physician in place of the hypnotist and a patient in place of the hypnotic subject. Hypnosis would then seem preordained to fulfil all the physician's requirements, insofar as he seeks to act towards the patient as a 'mind doctor'. Hypnosis endows the physician with an authority such as was probably never possessed by the priest or the miracle man, since it concentrates the subject's whole interest upon the figure of the physician; it does away with the autocratic power of the patient's mind which, as we have seen, interferes so capriciously with the influence of the mind over the body; it automatically produces an increase of the mind's control over the body, such as is normally to be observed only as an effect of the most powerful emotions; and, owing to the possibility of arranging that the instructions given to the patient during hypnosis shall only become manifest subsequently, in his normal state – owing, that is, to post-hypnotic suggestion – hypnosis enables the physician to use the great power he wields during hypnosis in order to bring about changes

in the patient in his waking condition. A simple pattern of procedure would thus seem to emerge for the purposes of mental treatment: the physician puts the patient into a state of hypnosis, he suggests to him (according to the particular circumstances) that he is not ill and that after waking he will not be aware of his symptoms. The physician then wakes the patient up and may feel confident that the suggestion has done its duty against the illness. And if a single application of this procedure were not sufficient, it could be repeated as many times as necessary.

There is only one consideration that might discourage the physician and the patient from making use of such a promising therapeutic method: the possibility that the advantages of hypnotism might be balanced by some damage – if, for instance, it left behind it a permanent disorder or weakness in the subject's mind. But enough experience has already been gained to set aside such doubts: single hypnotic treatments are completely harmless and even if they are frequently repeated they are on the whole without bad effects. Only one point is to be noticed: if circumstances demand a persistent use of hypnotism, the patient falls into a habit of hypnosis and dependence on the physician which cannot be among the purposes of the therapeutic procedure.

Thus hypnotic treatment really implies a great extension of medical [299]
power and consequently an advance in therapy. Every sufferer may be advised to entrust himself to it, so long as it is carried out by an experienced and trustworthy physician. Hypnosis should, however, be used in a manner different from what is usual today. As a rule this method of treatment is embarked upon only after every other method has failed and when the patient is already despondent and dejected. He has then to leave his own doctor, who cannot or does not employ hypnotism, and turn to a strange doctor, who as a rule does not or cannot employ anything else. Both practices are disadvantageous to the patient. The family doctor should himself be familiar with hypnotic procedure and he should make use of it from the first, as soon as he judges the illness and the patient appropriate for it. Wherever hypnotism can be employed it should be on a par with other therapeutic procedures and should not be regarded as a last resort or even as a descent from science to quackery. But hypnotism can be employed not only in all nervous conditions and in disorders due to the 'imagination', as well as for breaking morbid habits (such as alcoholism, morphine addiction or sexual aberrations), but also in many organic diseases, even of an inflammatory nature, in which, though the underlying disorder persists, there is a prospect of relieving the symptoms (such as pains or impediments to movement)

which are troubling the patient. The selection of cases for hypnotic treatment must depend entirely on the judgement of the physician.

The time has now come, however, to dissipate the notion that with the expedient of hypnosis a period of easy miracle-working has dawned for the physician. A number of circumstances must be taken into account which are calculated to lower our expectations from hypnotic therapy considerably, and to reduce to their proper proportions the hopes that may have been raised in patients. First and foremost, one of the basic assumptions turns out to be untenable: namely, that hypnosis makes it possible to deprive patients of the interfering autocratic element in their mental behaviour. In fact they retain it, and manifest it even in their attitude to the attempt to hypnotize them. It was stated above that some eighty per cent of people can be hypnotized; but that high figure is only reached by including among the positive cases any that show the
[300] slightest sign of being influenced. Really deep hypnoses, with complete tractability, such as are chosen as examples in describing the state, are actually rare or at all events not as frequent as one would wish from the therapeutic point of view. The impression made by this fact can, however, in turn be modified when it is borne in mind that depth of hypnosis and tractability to suggestions do not go *pari passu*; so that one often sees good suggestive results where there is no more than a slight hypnotic insensibility. But even if we consider hypnotic tractability independently, as being the more essential feature of the condition, it has to be admitted that different people show their idiosyncrasies by only letting themselves be influenced up to a certain degree of tractability, at which point they come to a halt. Thus different people show a very varying degree of suitability for hypnotic treatment. If it were possible to find a means by which all these various grades of the hypnotic state could be intensified to the point of complete hypnosis, the idiosyncrasies of patients would once more have been eliminated and the ideal of mental treatment would have been attained. But this advance has not yet been made; it still depends far more on the patient than on the physician with what degree of tractability a suggestion will be received – it depends once more, that is, upon the patient's choice.

And there is another, still more important consideration. In describing the very remarkable results of suggestion, people are only too ready to forget that here, as in all mental operations, relative size and strength must be taken into account. If we put a healthy person into deep hypnosis and then tell him to take a bite out of a potato under the impression

that it is a pear, or if we tell him that he is meeting one of his acquaintances and must greet him as such, he is likely to prove completely tractable, because the hypnotized subject has no serious reason for resisting the suggestion. But in the case of other instructions – if, for instance, we ask a naturally modest girl to uncover herself or if we ask an honest man to steal some valuable object – we may already find the subject putting up a resistance, which may even go to the length of his refusing to obey the suggestion. This teaches us that even in the best hypnosis suggestion does not exercise unlimited power but only power of a definite strength. The hypnotic subject will make small sacrifices, but, just as though he were awake, he hesitates before making great ones. If, then, [301]
we are dealing with a patient, and urge him by suggestion to give up his illness, we perceive that this means a great sacrifice to him and not a small one. Here the power of suggestion is contending against the force which created the symptoms and maintains them, and experience shows that that force is of quite a different order of strength from hypnotic influence. The same patient who is perfectly tractable in putting himself into any dream situation one may suggest to him (if it is not actually objectionable) may remain completely recalcitrant towards a suggestion which denies the reality of, let us say, an imaginary paralysis. There is the further fact, moreover, that precisely neurotic patients are for the most part bad hypnotic subjects, so that the struggle against the powerful forces by which the illness is rooted in the patient's mind has to be waged not by a complete hypnotic influence but only by a fragment of it.

Thus suggestion is not certain as a matter of course of defeating the illness as soon as hypnosis (even deep hypnosis) has been achieved. A further battle has to be fought, and its outcome is very often uncertain. A single hypnotic treatment will accordingly effect nothing against severe disturbances of mental origin. If, however, hypnosis is repeated, it loses some of the miraculous effect which the patient may perhaps have anticipated. A succession of hypnoses may eventually bring about by degrees the influence over the illness which was lacking at first, till in the end a satisfactory result is achieved. But a hypnotic treatment such as this may be just as tedious and wearisome as a treatment of any other kind.

There is yet another way in which the relative weakness of suggestion is betrayed as compared with the illnesses it has to combat. It is true that suggestion can bring about a cessation of the symptoms of an illness – but only for a short time. At the end of this time they return and have to be repelled once again by renewed hypnosis and suggestion. If this course of events is repeated often enough, it usually exhausts the patience both

of the patient and the physician and ends in the abandonment of hypnotic treatment. These, too, are the cases in which the patient becomes dependent on the physician and a kind of addiction to hypnosis is established.

[302] It is a good thing for patients to be aware of these weaknesses in hypnotic therapy and of the possibilities of disappointment in its use. The curative power of hypnotic suggestion is something real and it needs no exaggerated recommendation. On the other hand, it is not surprising that physicians, to whom hypnotic mental treatment promised so much more than it could give, are indefatigable in their search for other procedures, which would make possible a deeper, or at least a less unpredictable, influence on a patient's mind.[1] It may safely be anticipated that systematic modern mental treatment, which is a quite recent revival of ancient therapeutic methods, will provide physicians with far more powerful weapons for the fight against illness. A deeper insight into the processes of mental life, the beginnings of which are based precisely on hypnotic experience, will point out the ways and means to this end.

1 [The following two sentences were omitted in the revised (1918/19) edition, and replaced with a lengthy addendum which appears in the Appendix below.]

APPENDIX

ADDENDUM (1918/19)[1]

A method of treatment of this kind,[2] which may be claimed after more than 20 years of study to facilitate far deeper and more persistent influences than hypnotic suggestion, is so-called *psychoanalysis*. It is unfortunately very difficult to impart a correct idea [*Vorstellung*] of the nature and mode of action of psychoanalysis to laymen. The following remarks will have achieved their purpose if they provide the public with a first orientation to this new therapy, which is everywhere today being tried and studied, lauded or rejected.

It may be said of treatment by hypnotic suggestion that it introduces something new into the mental life [*Seelenlebens*] of the patient, the power [*Kraft*] of which is meant to do away with the symptoms. But the origin of these symptoms is of no concern to it and it leaves unaltered the conditions that gave rise to them. Psychoanalytic treatment by contrast is comparable to a surgical intervention. It seeks not only to soothe the disturbance but to radically remove it. The analogy with surgery may be carried further. When the surgeon wishes to remove something pathological he must first explore it and expose it and to this end he frequently penetrates into deep layers of the human body. Only a thorough knowledge of the anatomy of the body can assure his operations. The therapeutic work of psychoanalysis likewise begins with a careful investigation of the mental pathology, and is predicated on knowledge of the processes that occur in the deep layers of the human mind.

The ideas which constitute the subject matter of so-called academic psychology are totally inadequate for understanding the symptoms of mental pathology and therefore also could not lead the psychoanalyst in

1 [This addendum to 'Psychical (or Mental) Treatment' (1905*b*) was first published in a revised edition of *Die Gesundheit* (eds. R. Kossmann & J. Weiss, Stuttgart, Berlin & Leipzig: Union Deutsche Verlagsgesellschaft, 1918/19). It was reprinted by Gerhard Fichtner in 2007, in *Luzifer-Amor*, **40**, 122–41. The present translation, by Mark Solms, is the first into English.]

2 [The original text preceding the addendum ended with the words '. . . physicians, to whom hypnotic treatment promised so much more than it could give, are indefatigable in the search for other procedures, which would make possible a deeper, or at least a less unpredictable, influence on a patient's mind.']

his operations. It was necessary first to establish a 'depth psychology' the findings of which totally changed our conception [*Auffassung*]T of the normal processes of the mind and first rendered possible a conceptualization of its diseases. In this way we obtained knowledge of an interplay of mental forces [*Kräften*] of which we previously had no inkling, which support and oppose one another, allowing pathological manifestations to occur under certain conditions, and in combinations of which the physician can intervene for therapeutic purposes.

Among the findings of this depth psychology, only the most important and surprising are mentioned here: (1) *That not all mental processes achieve consciousness*. Very numerous and intense unconscious processes exist, which lie dormant in the depths of the mind while we shift things so to speak on the conscious surface. (2) That the manifestations of mental illness (symptoms) arise from *conflicts* between these mental forces. (3) That the symptoms are maintained *not by the conscious but by the unconscious* mental processes. (4) That a *strong resistance* is generated if one attempts to bring the pathogenic unconscious processes to the surface, thereby rendering them accessible to consciousness. Another finding arising from these investigations is that there are drive-like impulses [*triebartige Regungen*]T of emotional life, especially sexual impulses (in the broadest sense), which give the symptoms their power.

Trieb

As to the mode of action of psychoanalytic treatment, only a vague indication can be provided here. It achieves its goal by transforming unconscious mental processes into conscious ones, thereby overcoming the resistance and settling the conflict. Access to knowledge of the unconscious mental life (concealed from the patient) is provided through consideration of the analysand's dreams and of his little parapraxes [*Fehlleistungen*]T (slips of the tongue, lapses of memory, mislaying of objects [*Versprechen*, *Vergessen*, *Verlegen*]T, etc.), and by instructing the analysand to report the course and interconnection of his associations [*Einfälle*]T without critical inhibition. This procedure makes it possible to recognize that dreams have a meaning and can be interpreted [*Deutung*]T.

With this therapy the patient cannot assume the passive role that is assigned to him in hypnotic treatments and surgical operations. He must cooperate; nothing can happen to him that he does not himself support. Psychoanalytic treatment is therefore also comparable to a course of lessons, to an education [*Erziehung*]T. The patient learns to understand his own mental life, large parts of which were previously foreign to him, thereby following the precept of the ancients: Know thyself.[1] Any

1 [The celebrated inscription in the Temple of Apollo at Delphi.]

advance in self-knowledge corresponds to an increase in the mastery of his will over his illness.

Psychoanalysis can only be conducted by doctors who have specialized in this method of treatment and have mastered all the particulars of its technique on the basis of rich experience and practice. The doctor needs no instruments or apparatuses for this, as with other methods of treatment. This form of medical activity proves to involve purely mental [*geistige*] work.

Psychoanalysis consists in dialogue between the doctor and patients whose mental state has not been altered by any kind of influence. In the course of these discussions memories are activated and feelings aroused that are connected with the illness, the acknowledgement and management of which are the tasks of the therapy. A psychoanalytic treatment makes heavy demands on doctor and patient, lays claim to a considerable amount of time, and is not undertaken to remove individual symptoms. Its aim is the reworking and re-education [*Neuerziehung*][1] of the whole person, and even if this ideal can be only halfway achieved, it richly rewards all the expenditures involved.

This is a first example of a therapy grounded in detailed knowledge of the diseased [mental] function (or capacity) and it permits us to confidently expect that further advances in knowledge of the human mind will result in further increases in our medical powers.

1 [The German word *Erziehung* denotes not only education but also 'upbringing' in general.]

ON PSYCHOTHERAPY

Gentlemen, some eight years have passed since I had the opportunity, on [257]
the invitation of your late chairman, Professor von Reder, of speaking here on the subject of hysteria.[1] Shortly before that occasion I had published, in 1895, in collaboration with Dr Josef Breuer, the *Studies on Hysteria* in which, on the basis of the new knowledge which we owe to his researches, an attempt was made to introduce a new method of treating the neuroses. I am glad to be able to say that the efforts we made in our *Studies* have met with success; the ideas expressed in them concerning the effects produced by psychical traumas owing to retention of affect, as well as the conception [*Auffassung*][T] of hysterical symptoms as the results of an excitation [*Erregung*][T] transposed from the sphere of the mental to the physical – ideas for which we coined the terms 'abreaction' and 'conversion' – are today generally known and understood. There is, at least in German-speaking countries, no presentation of hysteria today that does not take them to some extent into account, and we have no colleagues who do not, for a short distance at least, follow the road pointed out by us. And yet, while they were still new, these theorems and this terminology must have sounded not a little strange.

I cannot say the same of the therapeutic procedure which was introduced to our colleagues at the same time as our theory; it is still struggling for recognition. There may be special reasons for this. At that time the technique of the method was as yet undeveloped; it was impossible for me to give medical readers of the book the directions necessary to enable them to carry through the treatment completely. But causes of a general nature have certainly also played a part. To many physicians, even today, psychotherapy seems to be a product of modern mysticism and, com- [258]
pared with our physicochemical remedies which are applied on the basis of physiological knowledge, appears positively unscientific and

1 [The occasion referred to was a series of three lectures on hysteria given by Freud before the Vienna College of Physicians on October 14, 21 and 28, 1895 – that is, *nine* years earlier. These were never published by him, though they were reported very fully in the Vienna medical papers (Freud, 1895*g*). Two of these reports are now included in *RSE*, **2**, 291 ff. Freud had lectured on a similar subject, the aetiology of hysteria, a year later (May 2, 1896; 1896*c*) before the Society for Psychiatry and Neurology, and the 'eight years' in the text above may be due to a confusion between the two occasions.]

unworthy of the attention of a serious investigator. Allow me, therefore, to defend the cause of psychotherapy before you, and to point out to you what may be described as unjust or mistaken in this condemnation of it.

In the first place, let me remind you that psychotherapy is in no way a modern method of treatment. On the contrary, it is the most ancient form of therapy in medicine. In Löwenfeld's instructive *Lehrbuch der gesamten Psychotherapie* [1897] many of the methods of primitive and ancient medical science are described. The majority of them must be classed under the head of psychotherapy; in order to effect a cure a condition of 'expectation coloured by faith' was induced in sick persons – a condition which answers a similar purpose for us today. Even since physicians have come upon other remedies, psychotherapeutic endeavours of one kind or another have never completely disappeared from medicine.[1]

Secondly, let me draw your attention to the fact that we physicians cannot discard psychotherapy, if only because another person intimately concerned in the process of recovery – the patient – has no intention of discarding it. You will know of the increase in knowledge on this subject that we owe to the Nancy school, to Liébeault and Bernheim. A factor dependent on the psychical disposition of the patient contributes, without any intention on our part, to the effect of every therapeutic process initiated by a physician; most frequently it is favourable to recovery, but often it acts as an inhibition. We have learnt to use the word 'suggestion' for this phenomenon, and Moebius has taught us that the unreliability which we deplore in so many of our therapeutic measures may be traced back to the disturbing influence of this very powerful factor. All physicians, therefore, yourselves included, are continually practising psychotherapy, even when you have no intention of doing so and are not aware of it; it is a disadvantage, however, to leave the mental factor in
[259] your treatment so completely in the patient's hands. Thus it is impossible to keep a check on it, to administer it in doses or to intensify it. Is it not then a justifiable endeavour on the part of a physician to seek to obtain command of this factor, to use it with a purpose, and to direct and strengthen it? This and nothing else is what scientific psychotherapy proposes.

And, in the third place, gentlemen, I would remind you of the well-established fact that certain diseases, in particular the psychoneuroses, are far more readily accessible to mental influences than to any other form of medication. It is not a modern dictum but an old saying of

1 [The contents of this and the next few paragraphs can be found in a much-expanded form in Freud's paper on 'Psychical (or Mental) Treatment' (1905*b*; p. 248 ff. above), to which the present paper may almost be regarded as a sequel.]

physicians that these diseases are not cured by the drug but by the physician, that is, by the personality of the physician, inasmuch as through it he exerts a mental influence. I am well aware that you favour the view which Vischer, the professor of aesthetics, expressed so well in his parody of Faust:

> Ich weiß, das Physikalische
> Wirkt öfters aufs Moralische[1]

But would it not be more to the point to say – and is it not more often the case – moral (that is, mental [*psychischen*]) means can influence a man's moral side?

There are many ways and means of practising psychotherapy. All that lead to recovery are good. Our usual word of comfort, which we dispense so liberally to our patients – 'You'll soon be all right again' – corresponds to one of these psychotherapeutic methods; but now that we have deeper insight into the neuroses, we are no longer obliged to confine ourselves to the word of comfort. We have developed the technique of hypnotic suggestion, and psychotherapy by mental distraction, by exercise, and by eliciting suitable affects. I despise none of these methods and would use them all in appropriate circumstances. If I have actually come to confine myself to one form of treatment, to the method which Breuer called *cathartic*, but which I myself prefer to call 'analytic', it is because I have allowed myself to be influenced by purely subjective motives. Because of the part I have played in founding this therapy, I feel a personal obligation to devote myself to closer investigation of it and to the development of its technique. And I may say that the analytic method [260]
of psychotherapy is the one that penetrates most deeply and carries farthest, the one by means of which the most extensive transformations can be effected in patients. Putting aside for a moment the therapeutic point of view, I may also say of it that it is the most interesting method, the only one which informs us at all about the origin and interrelation of morbid phenomena. Owing to the insight which we gain into mental illness by this method, it alone should be capable of leading us beyond its own limits and of pointing out the way to other forms of therapeutic influence.

Permit me now to correct a few mistakes that have been made in regard to this cathartic or analytic method of psychotherapy, and to give a few explanations on the subject.

1 [I know that the physical
Often influences the moral.]
F. T. Vischer, *Faust: der Tragödie, III. Teil* (Scene 4).

(*a*) I have observed that this method is very often confused with hypnotic treatment by suggestion; I have noticed this because it happens comparatively often that colleagues who do not ordinarily confide their cases to me send me patients – refractory patients, of course – with a request that I should hypnotize them. Now I have not used hypnosis for therapeutic purposes for some eight years (except for a few special experiments) so that I habitually send back these cases with the recommendation that anyone who relies upon hypnosis may employ it himself. There is, actually, the greatest possible antithesis between suggestive and analytic technique – the same antithesis which, in regard to the fine arts, the great Leonardo da Vinci summed up in the formulas: *per via di porre* and *per via di levare*.[1] Painting, says Leonardo, works *per via di porre*, for it applies a substance – particles of colour – where there was nothing before, on the colourless canvas; sculpture, however, proceeds *per via di levare*, since it takes away from the block of stone all that hides the surface of the statue contained in it. In a similar way, the technique of suggestion aims at proceeding *per via di porre*; it is not concerned with the origin, strength and meaning of the morbid symptoms, but instead, it superimposes something – a suggestion – in the expectation that it will be strong enough to restrain the pathogenic idea from coming
[261] to expression. Analytic therapy, on the other hand, does not seek to add or to introduce anything new, but to take away something, to bring out something; and to this end concerns itself with the genesis of the morbid symptoms and the psychical context of the pathogenic idea which it seeks to remove. It is by the use of this mode of investigation that analytic therapy has increased our knowledge so notably. I gave up the suggestive technique, and with it hypnosis, so early in my practice because I despaired of making suggestion powerful and enduring enough to effect permanent cures. In every severe case I saw the suggestions which had been applied crumble away again; after which the disease or some substitute for it was back once more. Besides all this I have another reproach to make against this method, namely, that it conceals from us all insight into the play of mental forces; it does not permit us, for example, to recognize the *resistance* with which the patient clings to his disease and thus even fights against his own recovery; yet it is this phenomenon of resistance which alone makes it possible to understand his behaviour in daily life.

1 [A full discussion of this can be found in Richter (1939), **1**, 87 ff., where the relevant passages from Leonardo are given in Italian and English.]

(*b*) It seems to me that there is a widespread and erroneous impression among my colleagues that this technique of searching for the origins of an illness and removing its manifestations by that means is an easy one which can be practised offhand, as it were. I conclude this from the fact that not one of all the people who have shown an interest in my therapy and passed definite judgements upon it has ever asked me how I actually go about it. There can be only one reason for this: that they think there is nothing to enquire about, that the thing is perfectly self-evident. Again, I am now and then astonished to hear that in this or that department of a hospital a young assistant has received an order from his chief to undertake a 'psychoanalysis' of a hysterical patient. I am sure he would not be allowed to examine an extirpated tumour unless he had convinced his chiefs that he was conversant with histological technique. Similarly, reports reach my ears that this or that colleague has arranged appointments with a patient in order to undertake a mental treatment of the case, though I am certain he knows nothing of the technique of any such therapy. His expectation must be therefore that the patient will make him a present of his secrets, or perhaps that he is looking for salvation in [262] some sort of confession or confidence. I should not be surprised if a patient were injured rather than benefited by being treated in such a fashion. For it is not so easy to play upon the instrument of the mind. I am reminded on such occasions of the words of a world-famous neurotic – though it is true that he was never treated by a physician but existed only in a poet's imagination – Hamlet, Prince of Denmark. The King has ordered two courtiers, Rosencrantz and Guildenstern, to follow him, to question him and drag the secret of his depression out of him. He wards them off. Then some recorders are brought on the stage and Hamlet, taking one of them, begs one of his tormentors to play upon it, telling him that it is as easy as lying. The courtier excuses himself, for he knows no touch of the instrument, and when he cannot be persuaded to try it, Hamlet finally breaks out with these words: 'Why, look you now, how unworthy a thing you make of me! You would play upon me; . . . you would pluck out the heart of my mystery; you would sound me from my lowest note to the top of my compass; and there is much music, excellent voice, in this little organ; yet you cannot make it speak. '*Sblood, do you think I am easier to be played on than a pipe? Call me what instrument you will, though you can fret me, you cannot play upon me*.' (Act III, Scene 2.)

(*c*) From certain of my remarks you will have gathered that there are many characteristics in the analytic method which prevent it from being an ideal form of therapy. *Tuto, cito, jucunde*: investigation and probing do not indicate speedy results, and the resistance I have mentioned would prepare you to expect unpleasantness of various kinds. Psychoanalytic treatment certainly makes great demands upon the patient as well as upon the physician. From the patient it requires perfect sincerity – a sacrifice in itself; it absorbs time and is therefore also costly; for the physician it is no less time-absorbing, and the technique which he must study and practise is fairly laborious. I consider it quite justifiable to resort to more convenient methods of treatment as long as there is any prospect of achieving anything by their means. That, after all, is the only point at issue. If the more difficult and lengthy method accomplishes considerably more than the short and easy one, then, in spite of everything, the use of the former is justified. Only consider, gentlemen, how
[263] much more inconvenient and costly is the Finsen therapy of lupus than the method of cauterizing and scraping previously employed; and yet the use of the former signifies a great advance, for it performs a radical cure. Although I do not wish to carry this comparison to extremes, the psychoanalytic method may claim a similar privilege. Actually, I have been able to elaborate and to test my therapeutic method only on severe, indeed on the severest cases; at first my material consisted entirely of patients who had tried everything else without success, and had spent long years in sanatoria. I have scarcely been able to bring together sufficient material to enable me to say how my method works with those slighter, episodic cases which we see recovering under all kinds of influences and even spontaneously. Psychoanalytic therapy was created through and for the treatment of patients permanently unfit for existence, and its triumph has been that it has made a satisfactorily large number of these permanently *fit* for existence. In the face of such an achievement all the effort expended seems trivial. We cannot conceal from ourselves what, as physicians, we are in the habit of denying to our patients, namely, that a severe neurosis is no less serious for the sufferer than any cachexia or any of the dreaded major diseases.

(*d*) The conditions under which this method is indicated, or contraindicated, can scarcely be definitely laid down as yet, because of the many practical limitations to which my activities have been subjected. Nevertheless, I will attempt to discuss a few of them here:

(1) One should look beyond the patient's illness and form an estimate

of his whole personality; those patients who do not possess a reasonable degree of education and a fairly reliable character should be refused. It must not be forgotten that there are healthy people as well as unhealthy ones who are good for nothing in life, and that there is a temptation to ascribe to their illness everything that incapacitates them, if they show any sign of neurosis. In my opinion a neurosis is by no means a stamp of degeneracy, though it may often enough be found in one person along with the signs of degeneracy. Now analytic psychotherapy is not a process suited to the treatment of neuropathic degeneracy; on the contrary, degeneracy is a barrier to its effectiveness. Nor is the method applicable to people who are not driven to seek treatment by their own sufferings, but who submit to it only because they are forced to by the authority of [264] relatives. The qualification which is the determining factor of fitness for psychoanalytic treatment – that is, whether the patient is educable – must be discussed further from another standpoint.

(2) To be quite safe, one should limit one's choice of patients to those who possess a normal mental condition, since in the psychoanalytic method this is used as a foothold from which to obtain control of the morbid manifestations. Psychoses, states of confusion and deeply rooted (I might say toxic) depression are therefore not suitable for psychoanalysis; at least not for the method as it has been practised up to the present. I do not regard it as by any means impossible that by suitable changes in the method we may succeed in overcoming this contra-indication – and so be able to initiate a psychotherapy of the psychoses.

(3) The age of patients has this much importance in determining their fitness for psychoanalytic treatment that, on the one hand, near or above the age of fifty the elasticity of the mental processes, on which the treatment depends, is as a rule lacking – old people are no longer educable – and, on the other hand, the mass of material to be dealt with would prolong the duration of the treatment indefinitely. In the other direction the age limit can be determined only individually; youthful persons under the age of adolescence are often exceedingly amenable to influence.

(4) Psychoanalysis should not be attempted when the speedy removal of dangerous symptoms is required, as, for example, in a case of hysterical anorexia.

By this time you will have formed an impression that the field of analytic psychotherapy is a very narrow one, since you have, in fact, heard

nothing from me except indications that point against it. There remain, however, cases and types of disease enough on which this therapy may be tested – as, for instance, all chronic forms of hysteria with residual manifestations, the broad field of obsessive conditions [*Zwangszustände*][T], abulias, and the like.

Zwang

It is gratifying that precisely the most valuable and most highly developed persons are best suited for this procedure; and one may also safely claim that in cases where analytic psychotherapy has been able to achieve but little, any other therapy would certainly not have been able to effect anything at all.

[265]

(*e*) You will no doubt wish to enquire about the possibility of doing harm by undertaking a psychoanalysis. In reply to this I may say that if you are willing to judge impartially, if you will consider this procedure in the same spirit of critical fairness that you show to our other therapeutic methods, you will have to agree with me that no injury to the patient is to be feared when the treatment is conducted with comprehension. Anyone who is accustomed, like the lay public, to blame the treatment for whatever happens during an illness will doubtless judge differently. It is not so very long since the same prejudice was directed against our hydropathic establishments. Many patients who were advised to go into an establishment of that kind hesitated because they had known someone who had entered the place as a nervous invalid and had become insane there. As you may guess, these were cases of early general paralysis that could still in their first stage be sent to a hydropathic establishment; once there, they had run their inevitable course until manifest mental disorder supervened: but the public blamed the water for this disastrous change. When it is a matter of new kinds of therapeutic treatment even physicians are not always free from such errors of judgement. I recall once making an attempt at psychotherapy with a woman who had passed the greater part of her life in a state alternating between mania and melancholia. I took on the case at the close of a period of melancholia and for two weeks things seemed to go smoothly; in the third week we were already at the beginning of the next attack of mania. This was undoubtedly a spontaneous transformation of the clinical picture, since in two weeks analytic psychotherapy cannot accomplish anything. And yet the eminent physician (now deceased) who saw the case with me could not refrain from the remark that psychotherapy was probably to blame for this 'relapse'. I am quite convinced that in other circumstances he would have shown a more critical judgement.

(*f*) Finally, gentlemen, I must confess that it is hardly fair to take up your attention for so long on the subject of psychoanalytic therapy without telling you in what this treatment consists and on what it is based. Still, as I am forced to be brief, I can only hint at this. This therapy, then, is based on the recognition that unconscious ideas [*Vorstellungen*][T] – or better, the unconsciousness of certain mental [*seelischer*][T] processes – are the direct cause of the morbid symptoms. We share this opinion with the French school (Janet) who, by the way, owing to excessive schematization, refer the cause of hysterical symptoms to an unconscious *idée fixe*.[1] Now please do not be afraid that this is going to land us in the depths of philosophical obscurities. Our unconscious is not quite the same thing as that of philosophers and, moreover, the majority of philosophers will hear nothing of 'unconscious mental processes'. If, however, you will look at the matter from our point of view, you will understand that the transformation [*Übersetzung*][T] of this unconscious material in the mind of the patient into conscious material must have the result of correcting his deviation from normality and of lifting the compulsion to which his mind has been subjected. For conscious willpower governs only conscious mental processes, and every mental compulsion [*psychische Zwang*] is rooted in the unconscious. Nor need you ever fear that the patient will be harmed by the shock accompanying the introduction of the unconscious into consciousness, for you can convince yourselves theoretically that the somatic and emotional effect of an impulse [*Regung*][T] that has become conscious can never be so powerful as that of an unconscious one. It is only by the application of our highest mental functions, which are bound up with consciousness, that we can control all our impulses. [266] *Seele*

There is, however, another angle from which you may seek to understand the psychoanalytic method. The uncovering and translating of the unconscious occurs in the face of a continuous *resistance* on the part of the patient. The process of bringing this unconscious material to light is associated with unpleasure [*Unlust*][T], and because of this the patient rejects it again and again. It is for you then to interpose in this conflict in the patient's mental life. If you succeed in persuading him to accept, by virtue of a better understanding, something that up to now, in consequence of this automatic regulation by unpleasure, he has rejected (repressed [*verdrängt*][T]), you will have accomplished something towards his education [*Erziehungsarbeit*][T]. For it is education even to induce someone who dislikes getting up early to do so all the same. Psychoanalytic treatment may in general be conceived of as such *after-education in* [267] *Verdrängung* *Erziehung*

1 [See Janet (1894), Chapter II.]

overcoming internal resistances. After-education of this kind is, however, in no respect more necessary to nervous patients than in regard to the
Sex mental element in their sexual life [*Sexualleben*][T]. For nowhere else have civilization [*Kultur*][T] and education done so much harm as in this field, and this is the point, as experience will show you, at which to look for those aetiologies of the neuroses that are amenable to influence; for the other aetiological factor, the constitutional component, consists of something fixed and unalterable. And from this it follows that one important qualification is required of the physician in this work: not only must his own character be irreproachable – 'As to morals, that goes without saying', as the hero of Vischer's novel *Auch Einer* was in the habit of declaring – but he must also have overcome in his own mind that mixture of prurience and prudery with which, unfortunately, so many people habitually consider sexual problems.

At this juncture another remark is perhaps not out of place. I know that the emphasis which I lay upon the part played by sexuality in creating the psychoneuroses has become generally known. But I know, too, that qualifications and exact particularization are of little use with the general public; there is very little room in the memory of the multitude; it retains only the bare gist of any thesis and fabricates an extreme version which is easy to remember. It may be, too, that some physicians vaguely apprehend the content of my doctrine to be that I regard sexual deprivation as the ultimate cause of the neuroses. In the conditions of life in modern society there is certainly no lack of sexual deprivation. On this basis, would it not be simpler to aim directly at recovery by recommending sexual activity as a therapeutic measure, instead of pursuing the circuitous and laborious path of mental treatment? I know of nothing which could impel me to suppress such an inference if it were justified. The real state of things, however, is otherwise. Sexual need and deprivation are merely one factor at work in the mechanism of neurosis; if there were no others the result would be dissipation, not disease. The other, no less essential, factor, which is all too readily forgotten, is the neurotic's aversion to sexuality, his incapacity for loving, that feature of the mind which I have called 'repression'. Not until there is a conflict
[268] between the two tendencies does nervous illness break out, and therefore to advise sexual activity in the psychoneuroses can only very rarely be described as good advice.

Let me end upon this defensive note. And let us hope that your interest in psychotherapy, when freed from every hostile prejudice, may lend us support in our endeavour to achieve success in treating even severe cases of psychoneurosis.

MY VIEWS ON THE PART PLAYED BY SEXUALITY IN THE AETIOLOGY OF THE NEUROSES

(1906 [1905])

The present translation is a revised and corrected reprint of the *SE* version.

Earlier editions of this book of Löwenfeld's had included discussions of Freud's views; but for the 4th edition Löwenfeld persuaded Freud to write this paper. He agreed to revise it for the 5th edition, but in fact made only a single trivial alteration. For the 6th edition, he penned a very brief addendum.

The most notable feature of this paper is that it contains Freud's first fully expressed withdrawal from his belief in the traumatic aetiology of hysteria and his first insistence on the importance of phantasies (views which he had communicated privately to Fliess many years before). See pp. 283 ff. below.

MY VIEWS ON THE PART PLAYED BY SEXUALITY IN THE AETIOLOGY OF THE NEUROSES

My theory of the aetiological importance of the sexual [*sexuellen*][T] factor in the neuroses can best be appreciated, in my opinion, by following the history of its development. For I have no desire whatever to deny that it has gone through a process of evolution and been modified in the course of it. My professional colleagues may find a guarantee in this admission that the theory is nothing other than the product of continuous and ever deeper-going experience. What is born of speculation, on the contrary, may easily spring into existence complete and thereafter remain unchangeable. [271] *Sex*

Originally my theory related only to the clinical pictures comprised under the term 'neurasthenia', among which I was particularly struck by two, which occasionally appear as pure types and which I described as 'neurasthenia proper' and 'anxiety neurosis' ['*Angstneurose*'][T]. It had, to be sure, always been a matter of common knowledge that sexual factors *may* play a part in the causation of these forms of illness; but those factors were not regarded as invariably operative, nor was there any idea of giving them precedence over other aetiological influences. I was surprised to begin with at the frequency of gross disturbances in the *vita sexualis* of nervous patients; the more I set about looking for such disturbances – bearing in mind the fact that everyone hides the truth in matters of sex – and the more skilful I became at pursuing my enquiries in the face of a preliminary denial, the more regularly was I able to discover pathogenic factors in sexual life, till little seemed to stand in the way of my assuming their universal occurrence. It was necessary, however, to presuppose from the start that sexual irregularities occurred with similar frequency in our ordinary society under the pressure of social conditions; and a doubt might remain as to the degree of deviation from normal sexual functioning which should be regarded as pathogenic. I was therefore obliged to attach less importance to the invariable evidence of sexual noxae than to a second discovery which seemed to me less ambiguous. It emerged that the form taken by the [272] *Angst*

illness – neurasthenia or anxiety neurosis – bore a constant relation to the nature of the sexual noxa involved. In typical cases of neurasthenia a history of regular masturbation or persistent emissions was found; in anxiety neurosis factors appeared such as *coitus interruptus*, 'unconsummated excitation', and other conditions – in all of which there seemed to be the common element of an insufficient discharge [*Abfuhr*][T] of the libido that had been produced. It was only after this discovery, which was easy to make and could be confirmed as often as one liked, that I had the courage to claim a preferential position for sexual influences in the aetiology of the neuroses. Furthermore, in the mixed forms of neurasthenia and anxiety neurosis which are so common it was possible to trace a combination of the aetiologies which I had assumed for the two pure forms. Moreover, this twofold form assumed by the neurosis seemed to tally with the polar (i.e. the masculine and feminine) character of sexuality.

At the time at which I was attributing to sexuality this important part in the production of the *simple* neuroses,[1] I was still faithful to a purely psychological theory in regard to the *psychoneuroses* (hysteria and obsessions [*Zwangsvorstellungen*]) – a theory in which the sexual factor was regarded as no more significant than any other emotional source of feeling. On the basis of some observations made by Josef Breuer on a hysterical patient more than ten years earlier, I collaborated with him in a study of the mechanism of the generation of hysterical symptoms, using the method of awakening the patient's memories in a state of hypnosis; and we reached conclusions which enabled us to bridge the gap between Charcot's traumatic hysteria and common non-traumatic hysteria (Breuer & Freud, 1895*d*). We were led to the assumption [*Auffassung*][T] that hysterical symptoms are the permanent results of psychical traumas, the sum of affect attaching to which has, for particular reasons, been prevented from being worked over consciously and has therefore found an abnormal path into somatic innervation. The terms 'strangulated affect', 'conversion' and 'abreaction' cover the distinctive features of this hypothesis.

But in view of the close connections between the psychoneuroses and
[273] the simple neuroses, which go so far, indeed, that a differential diagnosis is not always easy for inexperienced observers, it could not be long before the knowledge arrived at in the one field was extended to the other. Moreover, apart from this consideration, a deeper investigation of the psychical mechanism of hysterical symptoms led to the same

1 In my [first] paper on anxiety neurosis (1895*b*) [*RSE*, **3**, 81 ff.].

result. For if the psychical traumas from which the hysterical symptoms were derived were pursued further and further by means of the 'cathartic' procedure initiated by Breuer and me, experiences were eventually reached which belonged to the patient's childhood and related to his sexual life. And this was so, even in cases in which the onset of the illness had been brought about by some commonplace emotion of a nonsexual kind. Unless these sexual traumas of childhood were taken into account it was impossible either to elucidate the symptoms (to understand the way in which they were determined) or to prevent their recurrence. In this way the unique significance of sexual experiences in the aetiology of the psychoneuroses seemed to be established beyond a doubt; and this fact remains to this day one of the cornerstones of my theory.

This theory might be expressed by saying that the cause of lifelong hysterical neuroses lies in what are in themselves for the most part the trivial sexual experiences of early childhood; and, put in this way, it might no doubt sound strange. But if we take the historical development of the theory into account, and see as its essence the proposition that hysteria is the expression of a particular behaviour of the individual's sexual function and that this behaviour is decisively determined by the first influences and experiences brought to bear in childhood, we shall be a paradox the poorer but the richer by a motive [*Motiv*][T] for turning our attention to something of the highest importance (though it has hitherto been grossly neglected) – the after-effects [*Nachwirkungen*] of the impressions of childhood.

I will postpone until later in this paper a more thoroughgoing discussion of the question whether we are to regard the sexual experiences of childhood as the causes of hysteria (and obsessional neurosis), and I will now return to the form taken by the theory in some of my shorter preliminary publications during the years 1895 and 1896 (Freud, 1896*b* and 1896*c*; *RSE*, **3**, 173 ff. and 199 ff.). By laying stress on the supposed aetiological factors it was possible at that time to draw a contrast between the common neuroses as disorders with a *contemporary* aetiology and psychoneuroses whose aetiology was chiefly to be looked for in the sexual experiences of the remote past. The theory culminated in this thesis: if the *vita sexualis* is normal, there can be no neurosis. [274]

Though even today I do not consider these assertions incorrect, it is not to be wondered at that, in the course of ten years of continuous effort at reaching an understanding of these phenomena, I have made a considerable step forward from the views I then held, and now believe that I am in a position, on the basis of deeper experience, to correct the

insufficiencies, the displacements and the misunderstandings under which my theory then laboured. At that time my material was still scanty, and it happened by chance to include a disproportionately large number of cases in which sexual seduction by an adult or by older children played the chief part in the history of the patient's childhood. I thus overestimated the frequency of such events (though in other respects they were not open to doubt). Moreover, I was at that period unable to distinguish with certainty between falsifications made by hysterics in their memories of childhood and traces of real events. Since then I have learnt to explain a number of phantasies of seduction as attempts at fending off memories of the subject's *own* sexual activity (infantile masturbation). When this point had been clarified, the 'traumatic' element in the sexual experiences of childhood lost its importance and what was left was the realization that infantile sexual activity (whether spontaneous or provoked) prescribes the direction that will be taken by later sexual life after maturity. The same clarification (which corrected the most important of my early mistakes) also made it necessary to modify my view of the mechanism of hysterical symptoms. They were now no longer to be regarded as direct derivatives of the repressed memories of childhood experiences; but between the symptoms and the childish impressions there were inserted the patient's *phantasies* [*Phantasien*][T] (or imaginary memories), mostly produced during the years of puberty, which on the one side were built up out of and over the childhood memories and on the other side were transformed directly into the symptoms. It was only after the introduction of this element of hysterical phantasies that the texture of the neurosis and its relation to the patient's life became intelligible; a surprising analogy came to light, too, between these
[275] unconscious phantasies of hysterics and the imaginary creations of paranoics which become conscious as delusions.[1]

After I had made this correction, 'infantile sexual traumas' were in a sense replaced by the 'infantilism of sexuality'. A second modification of the original theory lay not far off. Along with the supposed frequency of seduction in childhood, I ceased also to lay exaggerated stress on the

1 [This passage was Freud's first explicit published intimation of his change of views on the relative importance of traumatic experiences and unconscious phantasies in childhood, apart from a brief allusion in his *Three Essays* (1905*d*; this volume, p. 169). In fact, however, he had become aware of his error many years earlier, for he revealed it in a letter to Fliess on September 21, 1897 (Freud, 1950*a*, Letter 69). The effects on Freud's own mind of the discovery of his mistake are vividly related by him in his 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 14 f., and in his *Autobiographical Study* (1925*d*), ibid., **20**, 29 f. For later developments in Freud's views on these phantasies, see the paper on 'Female Sexuality' (1931*b*), ibid., **21**, 227, and the *New Introductory Lectures* (1933*a*), ibid., **22**, 106.]

accidental influencing of sexuality on to which I had sought to thrust the main responsibility for the causation of the illness, though I had not on that account denied the constitutional and hereditary factors. I had even hoped to solve the problem of choice of neurosis (the decision to which form of psychoneurosis the patient is to fall victim) by reference to the details of the sexual experiences of childhood. I believed at that time – though with reservations – that a passive attitude in these scenes produced a predisposition to hysteria and, on the other hand, an active one a predisposition to obsessional neurosis. Later on I was obliged to abandon this view entirely, even though some facts demand that in some way or other the supposed correlation between passivity and hysteria and between activity and obsessional neurosis shall be maintained.[1] Accidental influences derived from experience having thus receded into the background, the factors of constitution and heredity necessarily gained the upper hand once more; but there was this difference between my views and those prevailing in other quarters, that on my theory the [276]
'sexual constitution' took the place of a 'general neuropathic disposition'. In my recently published *Three Essays on the Theory of Sexuality* (1905*d* [this volume, p. 121 ff.]) I have tried to give a picture of the variegated nature of this sexual constitution as well as of the composite character of the sexual drive [*Sexualtriebes*]^{T} in general and its *Trieb*
derivation from contributory sources from different parts of the organism.

As a further corollary to my modified view of 'sexual traumas in childhood', my theory now developed further in a direction which had already been indicated in my publications between 1894 and 1896. At that time, and even before sexuality had been given its rightful place as an aetiological factor, I had maintained that no experience could have a pathogenic effect unless it appeared intolerable to the subject's ego [*Ich*]^{T} and gave rise to efforts at defence [*Abwehr*]^{T} (Freud, 1894*a*). It was to this defence that I traced back the split in the psyche (or, as we said in those days, in consciousness) which occurs in hysteria. If the defence was successful, the intolerable experience with its affective consequences was expelled from consciousness and from the ego's memory. In certain circumstances, however, what had been expelled pursued its activities

1 [This particular solution to the problem of 'choice of neurosis' is most clearly expressed in Freud's second paper on the 'Neuropsychoses of Defence' (1896*b*), *RSE*, **3**, 178, and his French paper of the same date (1896*a*), ibid., **3**, 164–5. His interest in the general question of choice of neurosis goes back at least to the beginning of the same year (Draft K in Freud, 1950*a*) and he used the term itself in a letter to Fliess of May 30, 1896 (Letter 46). He was to return to the subject a few years later in special reference to obsessional neurosis (1913*i*), ibid., **12**, 313 ff., and indeed the problem never ceased to occupy his mind. The subject is discussed in some detail in the Editors' Note to this latter paper. (Ibid., **12**, 309 ff.)]

in what was now an unconscious state, and found its way back into consciousness by means of symptoms and the affects attaching to them, so that the illness corresponded to a failure in defence. This view had the merit of entering into the interplay of the psychical forces [*Kräfte*][T] and
Seele of thus bringing the mental [*seelischen*][T] processes in hysteria nearer to normal ones, instead of characterizing the neurosis as nothing more than a mysterious disorder insusceptible to further analysis.

Further information now became available relating to people who had remained normal; and this led to the unexpected finding that the sexual history of *their* childhood did not necessarily differ in essentials from that of neurotics, and, in particular, that the part played by seduction was the same in both cases. As a consequence, accidental influences receded still further into the background as compared with 'repression' (as I now began to say instead of 'defence').[1] Thus it was no longer a
[277] question of what sexual experiences a particular individual had had in his childhood, but rather of his reaction to those experiences – of whether he had reacted to them by 'repression' or not. It could be shown how in the course of development a spontaneous infantile sexual activity was often broken off by an act of repression. Thus a mature neurotic individual was invariably pursued by a certain amount of 'sexual repression' from his childhood; this found expression when he was faced with the demands of real life, and the psychoanalyses of hysterics showed that they fell ill as a result of the conflict between their libido and their sexual repression and that their symptoms were in the nature of compromises between the two mental currents.

I could not further elucidate this part of my theory without a detailed discussion of my views on repression. It will be enough here to refer to my *Three Essays* (1905*d*), in which I have attempted to throw some light – if only a feeble one – on the somatic processes in which the essential nature of sexuality is to be looked for. I have there shown that the constitutional sexual disposition of children is incomparably more variegated than might have been expected, that it deserves to be described as 'polymorphously perverse' and that what is spoken of as the normal behaviour of the sexual function emerges from this disposition after certain of its components have been repressed. By pointing out the infantile elements in sexuality I was able to establish a simple correlation

1 [Actually the term '*Verdrängung*'[T] ('repression') had made its first published appearance as early as in the Breuer & Freud 'Preliminary Communication' (1893*a*), *RSE*, **2**, 9. Many years later, in *Inhibitions, Symptoms and Anxiety* (1926*d*; see particularly Chapter XI A (*c*); ibid., **20**), Freud once more returned to the term '*Abwehr*' ('defence') as denoting a comprehensive concept, of which 'repression' represented only a single form.]

between health, perversion and neurosis. I showed that *normality* is a result of the repression of certain component drives and constituents of the infantile disposition and of the subordination of the remaining constituents under the primacy of the genital zones in the service of the reproductive function. I showed that *perversions* correspond to disturbances of this coalescence owing to the overpowering and compulsive development of certain of the component drives, while *neuroses* can be traced back to an excessive repression of the libidinal trends. Since almost all the perverse drives of the infantile disposition can be recognized as the forces concerned in the formation of symptoms in neuroses, though in a state of repression, I was able to describe neurosis as being the 'negative' of perversion. [Cf. p. 147 above.]

I think it is worth emphasizing the fact that, whatever modifications my views on the aetiology of the psychoneuroses have passed through, there are two positions which I have never repudiated or abandoned – [278] the importance of sexuality and of infantilism. Apart from this, accidental influences have been replaced by constitutional factors and 'defence' in the purely psychological sense has been replaced by organic 'sexual repression'. The question may, however, be raised of where convincing evidence is to be found in favour of the alleged aetiological importance of sexual factors in the psychoneuroses, in view of the fact that the onset of these illnesses may be observed in response to the most commonplace emotions or even to somatic precipitating causes, and since I have had to abandon a specific aetiology depending on the particular form of the childhood experiences concerned. To such a question I would reply that the psychoanalytic examination of neurotics is the source from which this disputed conviction of mine is derived. If we make use of that irreplaceable method of research, we discover that *the patient's symptoms constitute his sexual activity* (whether wholly or in part [cf. p. 145 above]), which arises from the sources of the normal or perverse component drives of sexuality. Not only is a large part of the symptomatology of hysteria derived directly from expressions of sexual excitement, not only do a number of erotogenic zones attain the significance of genitals during neuroses owing to an intensification of infantile characteristics, but the most complicated symptoms are themselves revealed as representing, by means of 'conversion', phantasies which have a sexual situation as their subject matter. Anyone who knows how to interpret the language of hysteria will recognize that the neurosis is concerned only with the patient's repressed sexuality. The sexual function must, however, be understood in its true extent, as it is laid down by

disposition in infancy. Wherever some commonplace emotion must be included among the determinants of the onset of the illness, analysis invariably shows that it is the sexual component of the traumatic experience – a component that is never lacking – which has produced the pathogenic result.

We have been led on imperceptibly from the question of the causation of the psychoneuroses to the problem of their essential nature. If we are prepared to take into account what has been learnt from psychoanalysis, we can only say that the essence of these illnesses lies in disturbances of the sexual processes, the processes which determine in the organism the formation [*Bildung*][T] and utilization of sexual libido. It is scarcely pos-
[279] sible to avoid picturing these processes as being in the last resort of a chemical nature; so that in what are termed the 'actual' [*aktuellen*][T] neuroses[I] we may recognize the *somatic* effects of disturbances of the sexual metabolism, and in the psychoneuroses the *psychical* effects of those disturbances as well. The similarity of the neuroses to the phenomena of intoxication and abstinence after the use of certain alkaloids, as well as to Graves' disease and Addison's disease, is forced upon our notice clinically. And just as these last two illnesses should no longer be described as 'nervous diseases', so also the 'neuroses' proper, in spite of their name, may soon have to be excluded from that category as well.[2]

Accordingly, the aetiology of the neuroses comprises everything which can act in a detrimental manner upon the processes serving the sexual function. At the forefront, then, are to be ranked the noxae which affect the sexual function itself – insofar as these are regarded as injurious by the sexual constitution, varying as it does with different degrees of culture [*Kultur*][T] and education [*Erziehung*][T]. In the next place comes every other kind of noxa and trauma which, by causing general damage to the organism, may lead secondarily to injury to its sexual processes. It should not, however, be forgotten that the aetiological problem in the case of the neuroses is at least as complicated as the causative factors of any other illness. A single pathogenic influence is scarcely ever sufficient; in the large majority of cases a *number* of aetiological factors are required, which support one another and must therefore not be regarded as being in mutual opposition. For this reason a state of neurotic illness cannot be sharply differentiated from health. The onset of the illness is the product of a summation and the necessary total of aetiological determinants can

1 [I.e. those with a purely contemporary and physical aetiology (neurasthenia and anxiety neurosis). See *RSE*, **24**, 56.]

2 [Cf. *Three Essays*, this volume, p. 191 and *n.* 1.]

be completed from any direction. To look for the aetiology of the neuroses exclusively in heredity or in the constitution would be just as one-sided as to attribute that aetiology solely to the accidental influences brought to bear upon sexuality in the course of the subject's life – whereas better insight shows that the essence of these illnesses lies solely in a disturbance of the organism's sexual processes.

Vienna, June, 1905

ADDENDUM (1922)[1]

Apart from the observation that the above account lacks an appreciation of the factors that bring forth sexual repression, I find nothing in it that requires revision or addition.

1 [This brief addendum, overlooked in the *SE* and *GW*, was added to the 6th edition of Löwenfeld's book.]

PSYCHOPATHIC CHARACTERS ON THE STAGE

(1942 [1905–06])

EDITORS' NOTE

PSYCHOPATHISCHE PERSONEN AUF DER BÜHNE

ENGLISH TRANSLATIONS

'Psychopathic Characters on the Stage'
1942 *Psychoan. Quart.*, **11** (4), Oct., 459–64. (Tr. H. A. Bunker.)
1953 *SE*, **7**, 305–10. (Tr. James Strachey.)

The present translation is a revised and corrected reprint of the *SE* version.

Dr Max Graf, in an article in the *Psychoan. Quart.*, **11** (1942), 465, relates that this paper was written by Freud in 1904 and presented to him by its author. It was never published by Freud himself. There must be some mistake about this date (the MS. itself is undated), for Hermann Bahr's play, *Die Andere*, which is discussed on p. 300 below, was first produced (in Munich and Leipzig) at the beginning of November, 1905, and had its first Vienna performance on the 25th of the same month. It was not published in book form until 1906. The probability is, therefore, that the present paper was written late in 1905 or early in 1906. Our thanks are due to Dr Raymond Gosselin, editor of the *Psychoanalytic Quarterly*, for supplying us with a photostat of Freud's original manuscript. The handwriting is in places difficult to decipher, which accounts for a few divergences between the two English translations. The term 'psychopathic' [*Psychopathische*] in this context is synonymous with 'psychopathological'.

PSYCHOPATHIC CHARACTERS ON THE STAGE

If, as has been assumed since the time of Aristotle, the purpose of drama [305]
is to arouse 'terror and pity' [*Furcht und Mitleid*][I] and so 'to purge the emotions', we can describe that purpose in rather more detail by saying that it is a question of opening up sources of pleasure [*Lust*][T] or enjoyment in our emotional life, just as, in the case of intellectual activity, joking or fun open up similar sources, many of which that activity had made inaccessible. In this connection the prime factor is unquestionably the process of getting rid of one's own emotions by 'blowing off steam'; and the consequent enjoyment corresponds on the one hand to the relief produced by a thorough discharge [*Abfuhr*][T] and on the other hand, no doubt, to an accompanying sexual excitation; for the latter, as we may suppose, appears as a by-product whenever an affect is aroused, and gives people the sense, which they so much desire, of a raising of the potential of their psychical state. Being present as an interested spectator at a stage-play[2] does for adults what play does for children, whose hesitant hopes of being able to do what grown-up people do are in that way gratified. The spectator is a person who experiences too little, who feels that he is a 'poor wretch to whom nothing of importance can happen', who has long been obliged to damp down, or rather displace, his ambition to stand in his own person at the hub of world affairs; he longs to feel and to act and to arrange things according to his desires – in short, to be a hero. And the playwright and actor enable him to do this by allowing him *to identify himself* with a hero. They spare him something, too. For the spectator knows quite well that actual heroic conduct such as this would be impossible for him without pains and sufferings and acute fears, which would almost cancel out the enjoyment. He knows, [306]

1 [The German '*Mitleid*' has the meaning of 'sympathetic suffering'.]

2 ['*Schauspiel*' is the ordinary German word for a dramatic performance. Freud writes it here with a hyphen '*Schau-spiel*' to bring out the word's two components: '*Schau*', 'spectacle', and '*Spiel*', 'play' or 'game'. Freud returned to this topic in his subsequent paper on 'Creative Writers and Daydreaming' (1908*e*), *RSE*, **9**, 123 ff., and again, many years later, in Chapter II of *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 17.]

moreover, that he has only *one* life and that he might perhaps perish even in a *single* such struggle against adversity. Accordingly, his enjoyment is based on an illusion; that is to say, his suffering is mitigated by the certainty that, firstly, it is someone other than himself who is acting and suffering on the stage, and, secondly, that after all it is only a game, which can threaten no damage to his personal security. In these circumstances he can allow himself to enjoy being a 'great man', to give way without a qualm to such suppressed impulses as a craving for freedom in religious, political, social and sexual matters, and to 'blow off steam' in every direction in the various grand scenes that form part of the life represented on the stage.

Several other forms of creative writing, however, are equally subject to these same preconditions for enjoyment. Lyric poetry serves the purpose, more than anything, of giving vent to intense feelings of many sorts – just as was at one time the case with dancing. Epic poetry aims chiefly at making it possible to feel the enjoyment of a great heroic character in his hour of triumph. But drama seeks to explore emotional possibilities more deeply and to give an enjoyable shape even to forebodings of misfortune; for this reason it depicts the hero in his struggles, or rather (with masochistic satisfaction) in defeat. This relation to suffering and misfortune might be taken as characteristic of drama, whether, as happens in serious plays, it is only *concern* that is aroused, and afterwards allayed, or whether, as happens in tragedies, the suffering is actually realized. The fact that drama originated out of sacrificial rites (cf. the goat and the scapegoat) in the cult of the gods cannot be unrelated to this meaning of drama.[1] It appeases, as it were, a rising rebellion against the divine regulation of the universe, which is responsible for the existence of suffering. Heroes are first and foremost rebels against God or against something divine; and pleasure is derived, as it seems, from the affliction of a weaker being in the face of divine might – a pleasure due to masochistic satisfaction as well as to direct enjoyment of a character whose greatness is insisted upon in spite of everything. Here we have a mood like that of Prometheus, but alloyed with a paltry readiness to let oneself be soothed for the moment by a temporary satisfaction.

[307] Suffering of every kind is thus the subject matter of drama, and from this suffering it promises to give the audience pleasure. Thus we arrive at a first precondition of this form of art: that it should not cause suffering to the audience, that it should know how to compensate, by means of the possible satisfactions involved, for the sympathetic suffering which is

1 [The subject of the hero in Greek tragedy was discussed by Freud in his *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 142, in Section 7 of the fourth essay.]

aroused. (Modern writers have particularly often failed to obey this rule.) But the suffering represented is soon restricted to *mental* [*seelisches*]^{T} suffering; for no-one who knows how quickly all mental *Seele*
enjoyment is brought to an end by the changes in somatic feeling that physical suffering brings about wants *physical* suffering. If we are sick we have one wish only: to be well again and to be quit of our present state. We call for the doctor and medicine, and for the removal of the inhibition [*Hemmung*]^{T} on the play of phantasy [*Phantasiespiels*]^{T} which has *Phantasie*
pampered us into deriving enjoyment even from our own sufferings. If a spectator puts himself in the place of someone who is physically ill he finds himself without any capacity for enjoyment or psychical activity. Consequently, a person who is physically ill can only figure on the stage as a piece of stage property and not as a hero, unless, indeed, some peculiar physical aspects of his illness make psychical activity possible – such, for instance, as the sick man's forlorn state in the *Philoctetes* or the hopelessness of the sufferers in the class of plays that centre round consumptives.

People are acquainted with mental suffering principally in connection with the circumstances in which it is acquired; accordingly, dramas dealing with it require some event out of which the illness shall arise and they open with an exposition of this event. It is only an apparent exception that some plays, such as the *Ajax* and the *Philoctetes*, introduce the mental illness as already fully established; for in Greek tragedies, owing to the familiarity of the material, the curtain rises, as one might say, in the middle of the play. It is easy to give an exhaustive account of the preconditions governing an event of the kind that is here in question. It must be an event involving conflict and it must include an effort of will together with resistance. This precondition found its first and grandest fulfilment in a struggle against divinity. I have already said that a tragedy of this kind is one of rebellion, in which the dramatist and the audience take the side of the rebel. The less belief there comes to be in divinity, the more important becomes the *human* regulation of affairs; and it is this which, [308]
with increasing insight, comes to be held responsible for suffering. Thus the hero's next struggle is against human society, and here we have the class of *social* tragedies. Yet another fulfilment of the necessary precondition is to be found in a struggle between individual men. Such are tragedies of *character*, which exhibit all the excitement of an '*agon*' [*ἀγών*, conflict], and which are best played out between outstanding characters who have freed themselves from the bond of human institutions – which, in fact, must have *two* heroes. Fusions between these two

last classes, with a hero struggling against institutions embodied in powerful characters, are of course admissible without question. Pure tragedies of character lack the rebellious source of enjoyment, but this emerges once again no less forcibly in social dramas (in Ibsen, for instance) than it did in the historical plays of the Greek classical tragedians.

When *religious* drama, *social* drama and drama of *character* differ essentially in the terrain on which the action that leads to the suffering is fought out, we can follow the course of drama on to yet another terrain, where it becomes *psychological* drama. Here the struggle that causes the suffering is fought out in the hero's mind itself – a struggle between different impulses [*Regungen*][T], and one which must have its end in the extinction, not of the hero, but of one of his impulses; it must end, that is to say, in a renunciation. Combinations of any kind between this precondition and the earlier types are, of course, possible; thus institutions, for instance, can themselves be the cause of internal conflicts. And this is where we have tragedies of love; for the suppression of love by social culture, by human conventions, or the struggle between 'love and duty', which is so familiar to us in opera, are the starting point of almost endless varieties of situations of conflict: just as endless, in fact, as the erotic daydreams of men.

But the series of possibilities grows wider; and psychological drama turns into psychopathological drama when the source of the suffering in which we take part and from which we are meant to derive pleasure is no longer a conflict between two almost equally conscious impulses but between a conscious impulse and a repressed [*verdrängten*][T] one. Here the precondition of enjoyment is that the spectator should himself be a neurotic, for it is only such people who can derive pleasure instead of simple aversion to the revelation and the more or less conscious recognition of a repressed impulse. In anyone who is *not* neurotic this recognition will meet only with aversion and will call up a readiness to repeat the act of repression which has earlier been successfully brought to bear on the impulse: for in such people a single expenditure of repression has been enough to hold the repressed impulse completely in check. But in neurotics the repression is on the brink of failing; it is unstable and needs a constant renewal of expenditure, and this expenditure is spared if recognition of the impulse is brought about. Thus it is only in neurotics that a struggle can occur of a kind which can be made the subject of a drama; but even in them the dramatist will provoke not merely an *enjoyment* of the liberation but a *resistance* to it as well.

Verdrängung

[309]

The first of these modern dramas is *Hamlet*.[1] It has as its subject the way in which a man who has so far been normal becomes neurotic owing to the peculiar nature of the task with which he is faced, a man, that is, in whom an impulse that has hitherto been successfully suppressed endeavours to make its way into action. *Hamlet* is distinguished by three characteristics which seem important in connection with our present discussion. (1) The hero is not psychopathic, but only *becomes* psychopathic in the course of the action of the play. (2) The repressed impulse is one of those which are similarly repressed in all of us, and the repression of which is part and parcel of the foundations of our personal evolution. It is this repression which is shaken up by the situation in the play. As a result of these two characteristics it is easy for us to recognize ourselves in the hero: we are susceptible to the same conflict as he is, since a person who does not lose his reason under certain conditions can have no reason to lose'.[2] (3) It appears as a necessary precondition of this form of art that the impulse that is struggling into consciousness, however clearly it is recognizable, is never given a definite name; so that in the spectator too the process is carried through with his attention averted, and he is in the grip of his emotions instead of taking stock of what is happening. A certain amount of resistance is no doubt saved in this way, just as, in an analytic treatment, we find derivatives of the repressed material reaching [310]
consciousness, owing to a lower resistance, while the repressed material itself is unable to [*versagt*][T] do so. After all, the conflict in *Hamlet* is so *Versagung*
effectively concealed that it was left to me to unearth it.

It may be in consequence of disregarding these three preconditions that so many other psychopathic characters are as unserviceable on the stage as they are in real life. For the victim of a neurosis is someone into whose conflict we can gain no insight if we first meet it in a fully established state. But, *per contra*, if we recognize the conflict, we forget that he is a sick man, just as, if he himself recognizes it, he ceases to be ill. It would seem to be the dramatist's business to induce the same illness in *us*; and this can best be achieved if we are made to follow the development of the illness along with the sufferer. This will be especially necessary where the repression does not already exist in us but has first to be set up; and this represents a step further than *Hamlet* in the use of neurosis on the stage. If we are faced with an unfamiliar and fully established neurosis, we shall be inclined to send for the doctor (just as we do in real life) and pronounce the character inadmissible to the stage.

1 [Freud's first published discussion of *Hamlet* was in *The Interpretation of Dreams* (1900*a*), Chapter V, Section D (*β*); *RSE*, **4**, 234 ff.]

2 [Lessing, *Emilia Galotti*, Act IV, Scene 7.]

This last mistake seems to occur in Bahr's *Die Andere*,[1] apart from a second one which is implicit in the problem presented in the play – namely, that it is impossible for us to put ourselves with conviction into the position of believing that one particular person has a prescriptive right to give the girl complete satisfaction. So that her case cannot become ours. Moreover, there remains a third mistake: namely that there is nothing left for us to discover and that our entire resistance is mobilized against this predetermined condition of love which is so unacceptable to us. Of the three formal preconditions that I have been discussing, the most important seems to be that of the diversion of attention.

In general, it may perhaps be said that the neurotic instability of the public and the dramatist's skill in avoiding resistances and offering fore-pleasures[2] can alone determine the limits set upon the employment of abnormal characters on the stage.

1 [This play by Hermann Bahr, the Austrian novelist and playwright (1863–1934), was first produced at the end of 1905. Its plot turns upon the dual personality of its heroine, who is unable, in spite of every effort, to escape from an attachment (based on her physical feelings) to a man who has her in his power. – This paragraph was omitted from the 1942 translation.]

2 [Cf. the discussion of 'fore-pleasure' at the end of 1908*e*; *RSE*, **9**, 131, where an Editors' note gives further references.]

STATEMENT ON MARRIAGE LAW REFORM

(1905)

EDITORS' NOTE

STELLUNGNAHME ZUR EHERECHTSENQUETE

GERMAN EDITIONS

1905 *Protokolle der Enquete betreffend die Reform des österreichischen Eherechts, Mitteilungen der kulturpolitischen Gesellschaft* [**3**], 76.
1978 *J. Mod. Hist.*, **50**, 99.

ENGLISH TRANSLATION

1978 *J. Mod. Hist.*, **50**, 91. (Tr. John Boyer.)

The present translation by Mark Solms is based on the 1978 version, but is a very substantial revision of it.

In 1902 a group of intellectuals and state officials in Vienna, many of whom were connected with the Fabian movement, organized a public society, the *Kulturpolitische Gesellschaft*, which they hoped would provide an alternative model to formal Liberal participation in the Austrian party political system. The society launched independent public-interest investigations of social issues. One of the most important of these was a symposium in 1905 concerning marriage law reform. The occasion for this symposium was a decision by the Imperial government in May, 1904, to appoint a commission to review proposals to reform the civil code. The society took advantage of this by directing public attention to a significant area of civil law that invited reform: the regulations governing marriage which made divorce impossible for Austrian Catholics. Legal separation was permitted, and provided for temporary property settlements and alimony, but this did not allow for remarriage. The inevitable, socially awkward and embarrassing consequences provided the main focus for the symposium. To complement the legalistic slant which the hearings inevitably took, several experts were invited to testify on the psychological premises and problems of divorce law, the most notable of whom was Freud. He declined to attend the hearings in person but prepared a written statement in response to the society's questionnaire. This was read into the record of the symposium by the society's secretary Fred Fakler on February 8, 1905. The opinions expressed in the statement culminated in his "'Civilized" Sexual Morality and Modern Nervous Illness' (Freud, 1908*d*; *RSE*, **9**, 159 ff.). For further background information, see Boyer (1978).

STATEMENT ON MARRIAGE LAW REFORM

I am answering only those questions that are closely related to my activity and experience as a physician.

Ad 2: [Is it inherent in the concept of marriage within our culture that marriage is monogamous; that is, would simultaneous or successive polygamy contradict our cultural concept?] I can very well imagine successive polygamy, at least, being made consistent with the demands of our culture [*Kulturanforderungen*][T]. Indeed this would in part merely sanction conditions that already exist. *Kultur*

Ad 7: [Would morality be better served if existing sexual relationships were legalized or if they were impeded insofar as they are extra-marital?] Perhaps the only practical way to promote morality would be the legalization of extra-marital relations between the sexes and therefore the curtailing of restrictions on them and the granting of more sexual freedom.

Ad 8: [Should equality of the two sexes be promoted?] Equality of the two sexes is virtually impossible due to their different roles in the reproductive function.

Ad 9: [Is it possible to imagine a differentiation within marriage that recognizes marriages of different legal status, especially in regard to descent (*matrimonium juris gentium* and *matrimonium juris civilis*)?] Our current knowledge of the laws of heredity does not seem to me to be sufficient to declare a prohibition of marriage in numerous cases – or categories of cases – on the basis of fears regarding possible damage to the descendants. In addition to the generally recognized existence of degeneration due to heredity, one must also acknowledge processes of regeneration in the ensuing generations. Were this not so, all of us living today would long ago have been destroyed by progressive hereditary degeneration.

Furthermore it is wrong to limit the rights of the living in favour of the unborn in too sensitive a way.

Ad 25: [Should marriage be indissoluble? Even after a factual break-up?]

Indissolubility of marriage contradicts important ethical and hygienic principles and psychological experience. It is especially unjust for the female, who is forced by natural conditions to enter marriage at a very young age, and thus in complete mental [*geistiger*][T] immaturity. Social demands, too, force her into marriage without knowledge of sexual life [*Liebeslebens*].

Geist

Ad 37: [What does science say about the effects of sustained sexual continence in the different age groups with different individual predispositions?] The representatives of medical science have said very different things about the effects of sustained sexual abstinence, largely because they have tried to avoid, with more or less transparent intentions, statements that must be embarrassing to the prevailing sexual order. Many physicians, even today, choose to underestimate the mighty sexual drive [*Geschlechtstrieb*][T] to a degree that must appear comical to anyone who is aware of the real situation – and they do this because they believe the dignity of science demands it of them.

Geschlecht, *Trieb*

I am of the opinion that it is only possible for a small minority of especially well-constituted people to uphold sexual abstinence without doing themselves damage, be they more frigid by nature or be they assisted by quite extraordinary diversions. For the great majority, however, sexual abstinence over a long stretch of life is almost impossible. Only weaklings accept the obstacles at hand; more powerful natures regularly evade them. Admittedly, sexual abstinence in itself is not very often found to be the cause of illness, but this is mainly due to the fact that normally endowed individuals are so in the habit of breaching it that the effects of abstinence can actually only be studied in people with pathological constitutions, who often also do themselves damage by employing inappropriate substitutes for sexual relations. The somatic damage caused by prolonged sexual abstinence may be described as a disposition to various forms of nervousness; the psychical consequences of involuntary abstinence, usually unobserved, seem to me to be more significant. The individual expends his mental [*seelischen*] energies in the never-ending struggle against temptation and thereby becomes impoverished of the qualities that he needs for the mastery of his social responsibilities: self-confidence, energy and boldness.

What I say here pertains primarily to men and to the demand for abstinence over long periods of time. Temporary abstinence is by comparison easy to attain. Indeed, the more normal the man is in his sexual life, the easier it is for him to remain abstinent, especially when substantial intellectual [*geistige*] work is at hand.

For women it appears to me an established fact that they are more frequently successful in observing abstinence, but this costs many of them a still greater psychical sacrifice. A class of today's cultivated women appear, incidentally, to have already been bred to frigidity.

A deferment of sexual relations in youth is possible without any damage under normal circumstances.

Ad 38: [Can a general demand for abstinence be upheld? Would one not have to recognize the existence of an irresistible urge in many cases of adultery, where gratification within the marriage is excluded for whatever reason but especially due to marital separation?] It follows from the above that a general demand for abstinence cannot be upheld, and that such sexual obligations can in no way be derived from the mere existence of a marriage when the marriage no longer fulfils the task of satisfying normal sexual drives.

Ad 45: [Should permanent insanity constitute grounds for divorce?] Permanent insanity deserves a place among the grounds for divorce, since it means the dissolution of the personality.

Ad 54: [Should the female sex have representation in the marriage courts?] It is only right and proper that women should be called upon to deal with those problems that concern their essential roles in life and that they should receive a voice in all such matters.

PROFESSOR SIGMUND FREUD

STATEMENT ON HOMOSEXUALITY

(1905)

EDITORS' NOTE

STELLUNGNAHME ZUM FALL PROF DR BEER

GERMAN EDITION

1905 Der Fall Beer, *Die Zeit*, October 27, 5.

ENGLISH TRANSLATION

1977 *The Body Politic*, **33**, 8. (Trans. James Steakley.)

The present translation is a new one by Mark Solms.

Freud made this statement on the afternoon that the verdict was handed down in an 'immorality' trial in the Vienna District Court. The case of Professor Beer, who was found guilty of having homosexual relations with two young boys, attracted considerable public interest and provoked debate about the social and legal standing of the concept of moral insanity. The Viennese daily *Die Zeit* therefore sought the opinions of relevant experts and published them on the morning after the conviction. Although Freud's statement was delivered verbally and reported from a transcript, there is no reason to believe that it was rendered inaccurately. In view of the light it casts on Freud's views on homosexuality, it has been included in the *RSE*, together with a letter that Freud wrote in 1935 in which he expresses similar views (Freud, 1951*a*), *RSE*, **22**, 270–1.

We owe the rediscovery of this statement to James Steakley (1975). Herb Spiers & Michael Lynch republished it two years later (in Steakley's translation) in a magazine article with the title 'The gay rights Freud'. In this article they drew attention to Freud's later views on the acceptance of homosexual candidates for training in psychoanalysis. These views, expressed in two *Rundbriefe* that have since been published (Wittenberger & Tögel, 2001, 2003), also seem worth recording here. Ernest Jones had written from London about a query from the Dutch Psychoanalytical Society concerning the application of a homosexual man. Having advised against acceptance, Jones wrote (on December 1, 1921) asking if this advice would be 'a safe general maxim to act on' in such cases. Freud replied from Vienna on December 11, in a letter co-signed by Otto Rank:

> As regards your query, dear Ernest, concerning prospective membership of homosexuals, we cannot agree with you. That is, we

> cannot exclude such persons in principle, for the same reasons that we also cannot condone their legal prosecution. We believe that a decision in such cases should depend on an individual examination of the other qualities of the candidate.

Jones responded that 'our condemnation of the punishment of homosexuality does not alter the fact that to the world it is an abhorrent crime, the committal of which by one of our members would certainly discredit us seriously' (December 21). From Berlin, Karl Abraham, Hanns Sachs and Max Eitingon broadly agreed with Freud and Rank but expressed other reservations, including the view that manifest homosexuals 'can travel only part of the way with us'. Freud and Rank then replied on January 22, 1922:

> We recognize the correctness of the [Berlin] argument regarding the analytic participation of homosexuals but still have to warn against making it into a law, considering the various types of homosexuality and the varying mechanisms by which it comes about.

STATEMENT ON HOMOSEXUALITY

I cannot comment on the particular matter concerning Professor Beer, since I am dependent solely and entirely on the newspaper reports and cannot form a judgement on the respective merits of the statements made by the two boys and the accused in his defence. Like many scholars I advocate the view that the case of a homosexual does not belong in the forum of a district court. Moreover I am firmly of the conviction that homosexuals should also not be treated as sick people; those with perverse constitutions are far from being ill on that account. Would we not otherwise have to describe as pathological many great thinkers and scholars throughout the ages about whose perverse predispositions we have certain knowledge and whose healthy minds are precisely what we admire about them? Homosexual individuals are not pathological but they also do not belong before the district court. A powerful movement is afoot, both here in Austria and also to a far greater extent in Germany, to eliminate from the law books the paragraph directed at perverts. This movement has enlisted eminent scholars and it will include ever-wider circles until it finally achieves its goal. The situation in a case like that of Professor Beer is different, however, presuming he is guilty. The accused in this case abused [*vergriffen*] children under 14 years of age, and such a person must be judged by the district court. The conviction must flow from the same grounds as it would if a *girl* under 14 years had been sexually assaulted, and indeed charges must be raised on grounds of rape, seduction and violation. The conviction of two adult persons on the grounds of homosexual relations is to be regretted; a person who abuses children, however, who have not reached the legal age of consent, should be convicted. This is my opinion, and a majority of my colleagues would share it.

CONTRIBUTIONS TO THE *NEUE FREIE PRESSE*[1] (1903–05)

I
Review of Georg Biedenkapp's *Im Kampfe gegen Hirnbacillen*[2]

Concealed behind this somewhat unpromising title is the book of a brave man who succeeds in telling the reader much that is worthy of consideration. The subtitle of the work reveals more of its content: 'A Philosophy of Small Words'. The author is in fact fighting against those 'little words and arrangements of words which exclude or include too much' and which reveal, in people who have the habit of using them for preference, a tendency towards 'exclusive or superlative judgements'. It is self-evident – our author would contest even this phrase – that the fight is not concerned with these harmless words but with the tendency to become intoxicated by them and to forget, on account of the exaggerated representation thus achieved, the necessary limitations on our pronouncements and the inevitable relativity of our judgements. It really serves as a useful warning if one is shown how much that was described by people of an earlier generation as 'self-evident' or as 'nonsensical' ranks with us today conversely as nonsensical or self-evident; or if we observe, in a series of well-chosen examples, to what a narrowing of their mental horizon even important writers must plead guilty, as a result of their misuse of superlatives. The exhortation to moderation in judgement and expression actually serves our author only as a point of departure for further discussions on other 'errors of thought' of human beings – on the central delusion, faith, on atheistic morality, and the like.

[9, 253]

[9, 254]

1 [Six short contributions to the Viennese daily paper the *Neue Freie Presse* can be attributed to Freud with certainty. These appeared between February, 1903, and August, 1905. Three of them (nos. III, IV and VI) were excluded from the *SE* and are now included here. The new translations, by Mark Solms, were first published in *Int. J. Psycho-Anal.*, **70** (1989), 397. The others, by Angela Richards, were first published in *SE*, **9** (1959), 253.]

2 [*Neue Freie Presse*, February 8, 1903, Morning Edition, p. 41. Reprinted in *GW*, **Nachtr.** (1987), 491–2. Biedenkapp, *Im Kampfe gegen Hirnbacillen* ('The Fight Against Brain Bacilli'), Berlin, 1902.]

In all these observations is manifest the author's honest endeavour to take seriously the implications of the particular view of the world necessitated by the discoveries of modern science, in particular of the theory of evolution. A lot that is psychologically accurate is included, and many truths of the kind that have often been said before but cannot be often enough repeated. The author has set himself the thankless task 'of improving and converting people' by means of exerting a sober influence, without seeking to move them to laughter by humour or sweep them along with him by passion. Let us wish him all success.

II
Review of John Bigelow's *The Mystery of Sleep*[1]

Solving the mystery of sleep might well have been reserved to science; the pious author, however, operates with biblical arguments and teleological causes. For example: it would be an idea unworthy of divine providence to suppose that it would allow human beings to spend a full third of their life in spiritual [*geistiger*][T] inactivity. Sleep is rather that state in which divine influence penetrates most freely and most effectively into human mental life [*Seelenleben*]. But in spite of all objections to the author's way of thinking we will not omit to emphasize the kernel of truth in his assertion. Scientific studies of the state of mental life during sleep, too, oblige us to relinquish as inadequate our previous assumption that sleep reduces the play of mental activity to a minimum. The important processes of unconscious mental and even intellectual activity [*Geistes- und selbst Denktätigkeit*] continue – as the elucidation of dreams given by your reviewer demonstrates – even during profound sleep. This unconscious mental activity [*Seelentätigkeit*] deserves to be called 'demonic' but scarcely divine.

III
Review of A. Baumgarten's *Neurasthenie. Wesen, Heilung, Vorbeugung*[2]

The reference in the preface to sixteen years' medical experience in the study of the disease and the promise of 'unreserved and ruthless truth'

1 [*Neue Freie Presse*, February 4, 1904, Morning Edition, p. 22. Reprinted in *GW*, **Nachtr.**, 493. Bigelow, *The Mystery of Sleep*, London, 2nd ed., 1903 (1st ed., London, 1897). Bigelow (1817–1911) was an American journalist and diplomat.]

2 [*Neurasthenia: Nature, Treatment, Prevention*. The work was subtitled: 'For Physicians and Non-Physicians, Based on Personal Experience'. *Neue Freie Presse*, February 4, 1904, Morning Edition, p. 22. Reprinted in *GW*, **Nachtr.**, 494.]

are bound to arouse expectations in the reader, which then fade to complete disappointment during the reading of the 338-page-long[1] book. Neither in the description of the symptoms nor in their elucidation does the author think of anything to say to us other than what is generally known. Yet the prevailing doctrine of the cultural disease [*Kulturkrankheit*][T] of neurasthenia contains more than enough that is dubious and erroneous, which an independent observer or truth-seeking person ought to have touched upon. Of course, the bias of the book is to show the significance of the Kneipp cure for neurasthenia in a favourable light.[2] Anyway, the view that Wörishofen is the right place for 'unreserved and ruthless' pursuit of truth will encounter strong prejudice on the part of the informed [*verständnisvollen*] reader. *Kultur*

IV
Note on '*Magnetische Menschen*'[3]

Man always longs for a key with which to unlock all secrets. Magnetism has ever appeared to be such a keyword. It has been, and remains, a word of great suggestive significance. It also seems understandable that the mysterious power of the magnet to act at a distance has not failed to have an effect upon phantasy [*Phantasie*][T]. There can naturally be no question of the magnet having an actual effect upon the person, nor a person upon the magnet.

V
Obituary of Professor S. Hammerschlag[4]

1 [This seems to be a misprint; the book was 367 pages long.]

2 [Wörishofen, the institution which published this book and to which the author belonged, was founded by Pastor Kneipp and run in accordance with his therapeutic views.]

3 [Literally 'magnetic people'. This short note by Freud was part of a longer review by Thomas (1904) which appeared in *Neue Freie Presse*, November 6, 1904, Morning Edition, p. 10. Reprinted in *GW*, **Nachtr.**, 133. The review dealt with an experiment by Harnack (1903–4) in which he demonstrated that it was possible to influence a compass needle by rubbing the glass with his finger. Harnack interpreted his findings as proof that some people have an innate ability to exert a strong magnetic force, thus reviving the discredited theories of Mesmer. To buttress his somewhat sarcastic review, Thomas invited Professors Holzmann, Exner and Freud to append comments.]

4 [*Neue Freie Presse*, November 11, 1904, Morning Edition, p. 8. Reprinted in *GW*, **Nachtr.**, 733–4. – Freud had been a pupil of Hammerschlag's and always retained an affectionate regard for him. Cf. Jones, 1953, 175, 179 and 183.]

great Jewish seers and prophets burnt in him and was not extinguished until old age weakened his powers. But the passionate side of his nature was happily tempered by the ideal of humanism of our German classical period which governed him, and his method of education was based on the foundation of the philological and classical studies to which he had devoted his own youth. Religious instruction served him as a way of educating towards love of the humanities, and from the material of Jewish history he was able to find means of tapping the sources of enthusiasm hidden in the hearts of young people and of making it flow out far beyond the limitations of nationalism or dogma. Those of his pupils who were later allowed to seek him out in his own home gained a paternally solici-
[9, 256] tous friend in him and were able to perceive that sympathetic kindness was the fundamental characteristic of his nature. Feelings of gratitude towards a revered teacher – undiminished through the course of decades – received most dignified expression over his grave from Dr Friedjung the historian.

VI
Review of R. Wichmann's *Lebensregeln für Neurastheniker*[1]

Here, in the fourth [revised] edition, we have a small booklet [72 pages] which, in the form of a question-and-answer game, imparts really sensible things to the 'neurasthenic'[2] about his affliction and gives him advice – the value of which for the treatment of the condition should not, however, be overestimated. The author himself disclaims that the intention of the book is to render superfluous the personal efforts of the physician with the patient; and since the healthy are not in the habit of reading such books, one might well dispute the right to existence of this whole genre of popular-medical literature. On some points, with regard to which theoretical elucidation and practical instruction would be particularly important, the writer has made the task really easy for himself; and the exposition of anxiety [*Angst*]^{T} and obsessional states
Zwang [*Zwangszustände*]^{T} is completely inadequate.

1 [*Rules of Life for Neurasthenics*. Berlin: O. Salle, 1903; *Neue Freie Presse*, August 31, 1905, Morning Edition, p. 21. Reprinted in *GW*, **Nachtr.**, 495.]

2 [The inverted commas no doubt refer to the fact that, although Freud (1895*b*), *RSE*, **3**, 81 ff., had differentiated 'neurasthenia proper' from 'anxiety neurosis', Wichmann retained the old homogeneous classification.]

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

GENERAL INDEX

Abasia, 179 *n.* 3
Aberrations, sexual (*see also* 'Inversion', sexual; Perversions), 45–6, 121–53, 204, 208–9, 255
  literature of, 121 *n.* 1
Abraham, K. (*see also* Bibliography), 175 *n.* 1, 176 *n.* 1, 177 *n.* 1, 182 *n.* 3, 312
Abreaction, 223, 267, 282
Abulia, 227, 233, 274
Activity and passivity (*see also* Masculine and feminine), 113, 141–2, 148, 176, 194 *n.* 1, 285
Actual neuroses, 288
Addenda to dreams, 65, 84 *nn.* 1, 2 & 4, 85, 88, 89 *n.* 3, 90
Addison's disease, 288
Adler, A. (*see also* Bibliography), 163 *n.* 1
Adult sexuality
  and infantile sexuality, 77–8, 176, 183 *n.* 1, 187, 201–2, 206–7, 214
  and Oedipus complex, 199 *n.* 3
  sexual aim of, 133–4, 183, 186–7, 195–6, 207
Aesthetic pleasure (*see also* Art and sublimation), 186 *n.* 1
Affect
  and predisposition to illness, 245, 249–50
  and sexual excitation, 179–180, 206, 295
  and unconscious mental processes, 53, 223
  conflict of, 23
  repression of, 267, 282, 285–6
  reversal of, 27, 28–9
  somatic expression of, 244–5, 254
  strangulated, 223, 282
Affection and sensuality, 177, 183, 197–8, 199 *n.* 1, 200–1
After-education, 275–6
Age and suitability for psychoanalytic treatment, 227–8, 273
Aggressiveness (*see also* Mastery, drive to; Sadism), 140–2, 176, 179, 194 *n.* 1
Agoraphobia, 179 *n.* 3
Ajax (by *Sophocles*), 297
Alcoholism, 255
Algolagnia, 140
Ambition, 211 *n.* 1
Ambivalence, 142 *n.* 4, 176
Amnesia
  hysterical, 10, 17–18, 22, 29–30, 56, 123 *n.* 2, 156, 225, 226
  infantile, 123 *n.* 2, 155–6, 168, 169 *n.* 1
Anaclitic object choice, 196 *n.* 2
Anaclitic relation of libidinal to self-preservative drive, 140–2, 161, 164, 175–6, 181–2, 196–7, 205
Anaesthesia, sexual, 47, 195, 200
Anal erotism, 130, 136, 148, 150, 164–6, 175–6, 182 *n.* 1, 206, 211 *n.* 1
  and character traits, 211 *n.* 1
  and constipation, 165–6
  and neuroses, 148
  and repression, 166 *n.* 1
Analogies
  'ab' and 'a b', 35–6
  archaeological restoration, 12
  collateral channels of river-bed, 151, 205
  dammed stream, 46, 151, 205
  entrepreneur and capitalist, 77
  festoons of flowers on wire, 75

Analogies (*cont.*)
Finsen's therapy of lupus, 272
Great Pyramid, 156 *n.* 1
Hamlet and the recorders, 271
intercommunicating pipes, 134 *n.* 2
pearl in oyster, 73
'*Per via di porre*' and '*per via di levare*', 270
Pine shavings for kindling wood, 195
Plato's myth of bisexuality, 122
reprinted edition, 103
river choked by rocks, 16
tunnel pierced from two sides, 183
Analytic (*see* Psychoanalytic technique/treatment)
Andere, Die (by *H. Bahr*), 293, 300
Andreas-Salomé, L. (*see also* Bibliography), 166 *n.* 1
Animals, sexuality in, 121, 157 *n.* 2, 175, 202 *n.* 2, 207
Anorexia, 227, 273
Antiquity
glorification of sexual drive in, 133 *n.* 1
'inversion' in, 45, 124, 129 and *n.* 1, 203
psychological treatment in, 249
Anxiety, neurotic, 71, 112, 197–8, 233–5, 251, 281–2, 288 *n.* 1
Anxiety dreams, 27 *n.* 1, 84, 89 *n.* 2
Anxiety neurosis, 71, 112, 233–5, 281–2, 288 *n.* 1
Aphonia, 4, 21–2, 25–6, 36–8, 48, 107
Appendicitis hysterically simulated, 21, 90–2
Arduin, P. (*see also* Bibliography), 128 *n.* 2
Aristophanes, 122 *n.* 1
Aristotle, 295
Art and sublimation (*see also* Aesthetic pleasure), 139–40, 211
Association
free, 12, 30, 99, 103, 224–6
paths of, 29, 48–9
Atheistic morality, 315
Attention, 225, 246, 249–51, 299–300
Auch Einer (by *F. T. Vischer*), 276
Auto-erotism (*see also* Masturbation), 161, 171 *n.* 2, 174–6, 179 *n.* 3, 183, 193–4, 196, 206
Bahr, H., 293, 300
Baldwin, J. M. (*see also* Bibliography), 154 *n.* 2
Baumgarten, A., 316–17
Bayer, H. (*see also* Bibliography), 157 *n.* 2
Beauty and sexual attraction, 139 *n.* 2, 185
Bedwetting (*see* Enuresis)
Beer, Professor, 311, 313
Bell, J. Sanford (*see also* Bibliography), 154 *n.* 2, 171 *n.* 2
Bernfeld, S. (*see also* Bibliography), 241 *n.* 2
Bernheim, H., 268
Bestiality, 132
Bible, the, 49
Biedenkapp, G. (*see also* Bibliography), 315–16
Bigelow, G. (*see also* Bibliography), 316
Binet, A. (*see also* Bibliography), 137–8, 152
Biological factors, 116–17, 118, 121, 140, 157 *n.* 2, 163, 173, 176 *n.* 1, 177 *n.* 1, 190, 194 *n.* 1, 199 *n.* 3, 202 *n.* 2, 213, 214–15
Birth
infantile theories of, 165–6, 173–4
phantasies of, 91–3, 96, 98 *n.* 1
trauma, 199 *n.* 3
Bisexuality, 4, 100, 112, 122, 126–32, 142, 190, 194
literature of, 128 *n.* 2
Bladder disturbances, 168
Bleuler, E. (*see also* Bibliography), 154 *n.* 2, 168 *n.* 1, 176
Bloch, I. (*see also* Bibliography), 46 *n.* 2, 121 *n.* 1, 125 and *n.* 1, 134 *n.* 2
Body and mind, relation between, 242–55
Box as symbol, 68–9, 85–7
Boyer, J. (*see also* Bibliography), 303
Boys
and railway interests, 178–9
'inversion' in, 202–3
masturbation in, 167, 193–4
sexual researches of, 172–3
Breast, child's relation to, 47, 161, 164 *n.* 1, 196
Breuer, J. (*see also* Bibliography), 25 and *n.* 2, 145, 146 *n.* 2, 223–4, 267, 269, 282–3

Brill, A. A., 117 *n.* 2
Brodmann, K., 4
Buttocks, 171

Cannibalism, 142, 175
Case
  of '*Dora*', 3–108, 114, 139 *n.* 2, 147 *n.* 2, 149 *n.* 1, 191 *n.* 1, 244 *n.* 1
  of '*Little Hans*', 13 *n.* 1, 47 *n.* 2, 171 *n.* 2, 213 *n.* 1
  of '*Rat Man*', 13 *n.* 1, 17 *n.* 2, 138 *n.* 3, 199 *n.* 3, 221
  of *Senatspräsident Schreber*, 13 *n.* 1
  of '*Wolf Man*', 13 *n.* 1
Castration
  complex, 140 *n.* 2, 141, 173
  effects of, 129 *n.* 1, 189–90
  threat of, 137 *n.* 1, 139, 140 *n.* 2, 199 *n.* 3, 202
Catharsis, 145, 223–4, 269, 283
Character
  and suitability for psychoanalytic treatment, 227, 273
  structure of, 211
Charcot, J.-M., 36, 102, 282
Chemistry, sexual, 100, 112, 129 *n.* 1, 150, 179, 190–1, 193, 241, 288
Chevalier, J. (*see also* Bibliography), 126, 128 *n.* 2
Childhood experiences, 26, 63, 77–9, 81, 92, 125–6, 212, 214–15, 283–8
Children (*see also* Infantile sexuality; Parents and children, relations between)
  neurotic anxiety in, 197–8
  psychoanalysis of, 118–19
  sexual abuse of (*see also* Seduction), 133
  tu quoque arguments of, 32–3
Civilization and sexuality, 158, 207, 214
Claudius (in *Hamlet*), 271
Cleanliness, obsessional, 19, 72 *n.* 1, 80

Title page of the first edition of
Jokes and their Relation to the Unconscious

It was published in 1905, five years after *The Interpretation of Dreams*. Freud wrote of it in his *Autobiographical Study*: 'The only friend of mine who was at that time interested in my work [Fliess] remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes . . .' (*RSE*, **20**, 57.)

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

The Joke and its Relation to the Unconscious

2002 *PMC*. Pp. xlii + 232. London: Penguin. (Tr. Joyce Crick.)

The present translation is a revised and corrected reprint of the *SE* version.

In the course of discussing the relation between jokes and dreams, Freud mentions his own 'subjective reason for taking up the problem of jokes' (p. 150 below). This was, put briefly, the fact that, when Wilhelm Fliess was reading the proofs of *The Interpretation of Dreams* in the autumn of 1899, he complained that the dreams were too full of jokes. The episode had already been reported in a footnote to the first edition of *The Interpretation of Dreams* itself (1900*a*), *RSE*, **4**, 265 *n.*; but we can date it exactly, for we have the letter in which Freud replied to Fliess's complaint. It was [4]

written on September 11, 1899, from Berchtesgaden, where the finishing touches were being put to the book, and announces that Freud intends to insert an explanation in it of the curious fact of the presence in dreams of what appear to be jokes (Freud, 1950*a*, Letter 118).[1]

The episode acted, no doubt, as a precipitating factor, and led to Freud's giving closer attention to the subject; but it cannot possibly have been the origin of his interest in it. There is ample evidence that it had been in his mind for several years earlier. The very fact that he was ready with an immediate answer to Fliess's criticism shows that this must have been so; and it is confirmed by the reference to the mechanism of 'comic' effects, which appears on a later page of *The Interpretation of Dreams* (*RSE*, **5**, 542) and which forestalls one of the main points in the final chapter of the present work. But it was inevitable that as soon as Freud began his close investigation of dreams he would be struck by the frequency with which structures resembling jokes figure in the dreams themselves or their associations. *The Interpretation of Dreams* is full of examples of this, but perhaps the earliest one recorded is the punning hallucination of Frau Cäcilie M., reported in a footnote at the end of the case history of Fräulein Elisabeth von R. in the *Studies on Hysteria* (1895*d*), ibid., **2**, 161 *n*.

But, quite apart from dreams, there is evidence of Freud's early theoretical interest in jokes. In a letter to Fliess of June 12, 1897 (Freud, 1950*a*, Letter 65), after quoting a joke about two *Schnorrer*, Freud wrote: 'I must confess that for some time past I have been putting together a collection of Jewish anecdotes of deep significance.' A few months later, on September 21, 1897, he quotes another Jewish story as being 'from my collection' (ibid., Letter 69), and a number of others appear in the Fliess correspondence and also in *The Interpretation of Dreams*. (See, in particular, a comment on these stories in Chapter V, Section B; *RSE*, **4**, 172.) It was from this collection, of course, that he derived the many examples of such anecdotes on which his theories are so largely based.

Another influence which was of some importance to Freud at about this time was that of Theodor Lipps. Lipps (1851–1914) was a Munich professor who wrote on
[5] psychology and aesthetics, and who is accredited with having introduced the term '*Einfühlung*' (conventionally translated 'empathy'; see *RSE*, **24**, 64–5). Freud's interest in him was probably first attracted by a paper on the unconscious which he read at a psychological congress in 1897. It is the basis of a long discussion in the last chapter of *The Interpretation of Dreams* (ibid., **5**, 546 ff.). We know from the Fliess letters that in August and September, 1898, Freud was reading an earlier book by Lipps on *The Basic Facts of Mental Life* (1883) and was again struck by his remarks on the unconscious (Freud, 1950*a*, Letters 94, 95 and 97). But in 1898 there appeared yet another work from Lipps and this time on a more specialized subject – *Komik und Humor*. And it was this work, as Freud tells us at the very beginning of the present study, which encouraged him to embark upon it.

It was on ground thus prepared that the seed of Fliess's critical comment fell, but even so several more years were to elapse before the moment of fruition.

Grubrich-Simitis's (1993, 151 f.; trans., 113 f.) study of Freud's previously unknown and unpublished notes suggests that the immediate base from which he began (in the

1 [References in the *RSE* to the Fliess correspondence are to the 1950 edition (translated by Mosbacher & Strachey, 1954). See *RSE*, **1**, xxx.]

wake of Fliess's comment) to contemplate the psychology of jokes was a comparison with the techniques of riddles – taking as his example the 'daldal' riddles thought up by his former philosophy teacher Franz Brentano (see Appendix, p. 206 below). The comparison with riddles was then reversed and relegated to a footnote in the present work (p. 28 *n.* 6).

Freud published three major works in 1905: the 'Dora' case history, which appeared in the autumn, though it was written for the most part four years earlier, the *Three Essays on the Theory of Sexuality* and *Jokes and their Relation to the Unconscious*. Work on the last two books proceeded simultaneously: Ernest Jones (1955, 13) tells us that Freud kept the two manuscripts on adjoining tables and added to one or the other according to his mood. The books were published almost simultaneously, and it is not entirely certain which was the earlier. The publisher's issue number for the *Three Essays* is 1124 and for the *Jokes* 1128; but Jones (ibid., 375 *n.*) reports that this last number was 'wrong',[1] which might imply that the order should be reversed. In the same passage, however, Jones definitely asserts that the *Jokes* 'appeared just after the other book'. The actual date of publication must have been before the beginning of June, for a long and favourable review appeared in the Vienna daily paper *Die Zeit* on June 4.

The later history of the book was very different from that of Freud's other major works of this period. *The Interpretation of Dreams*, *The Psychopathology of Everyday Life* and the *Three Essays* were all of them expanded and modified almost out of recognition in their later editions. Half a dozen small additions were made to the [6]
Jokes when it reached its second edition in 1912, but no further changes were ever made in it.[2]

It seems possible that this is related to the fact that this book lies somewhat apart from the rest of Freud's writings. He himself may have taken this view of it. His references to it in other works are comparatively few;[3] in the *Introductory Lectures* (1916–17*a*), Lecture XV; *RSE*, **15**, 205, he speaks of its having temporarily led him aside from his path; and in the *Autobiographical Study* (1925*d*), ibid., **20**, 57, there is even what looks like a slightly depreciatory reference to it. Then, unexpectedly, after an interval of more than twenty years, he picked up the thread again with his short paper on 'Humour' (1927*d*), ibid., **21**, in which he used his newly propounded structural view of the mind to throw a fresh light on an obscure problem.

Ernest Jones describes this as the least known of Freud's works, and that is certainly, and not surprisingly, true of non-German readers.

'*Traduttore – Traditore!*' The words – one of the jokes discussed by Freud below (p. 30) – might appropriately be emblazoned on the title page of the present volume. Many of Freud's works raise acute difficulties for the translator, but this presents a special case. Here, as with *The Interpretation of Dreams* and *The Psychopathology of Everyday Life* and perhaps to a greater extent, we are faced with large numbers of examples involving a play upon words that is untranslatable. And here, as in these

1 In a private communication he ascribed this statement to Freud himself.

2 In the present edition the sections into which the author divided the long chapters have been numbered for convenience of reference.

3 A small exception can be found in a paragraph on obscene jokes in Freud's open letter to Dr F. S. Krauss (1910*f*), *RSE*, **11**, 224.

other cases, we can do no more than explain the rather uncompromising policy adopted in this edition. There are two methods one or other of which has usually been adopted in dealing with such intractable examples – either to drop them out altogether or to replace them with examples of the translator's own. Neither of these methods seems suitable to an edition which is intended to present English readers with Freud's own ideas as accurately as possible. Here, therefore, we have to be content with giving the critical words in the original German and explaining them
[7] as briefly as possible in square brackets or footnotes. Inevitably, of course, the joke disappears in the process. But it must be remembered that, by either of the alternative methods, what disappears are portions, and sometimes most interesting portions, of Freud's arguments. And, presumably, these, and not a moment's amusement, are what the reader has in view.

There is, however, a much more serious difficulty in translating this particular work – a terminological difficulty which runs through the whole of it. By a strange fatality (into whose causes it would be interesting to enquire) the German and English terms covering the phenomena discussed in these pages seem never to coincide: they seem always too narrow or too wide – to leave gaps between them or to overlap. A major problem faces us with the very title of the book, '*Der Witz*'.[t] To translate it 'Wit' opens the door to unfortunate misapprehensions. In ordinary English usage 'wit' and 'witty' have a highly restricted meaning and are applied to only the most refined and intellectual kind of jokes. The briefest inspection of the examples in these pages will show that '*Witz*' and '*witzig*' have a far wider connotation.[1] 'Joke', on the other hand, seems itself to be too wide and to cover the German '*Scherz*' as well. The only solution in this and similar dilemmas has seemed to be to adopt one English word for some corresponding German one, and to keep to it quite consistently and invariably even if in some particular context it seems the wrong one. In this way the reader will at least be able to form his own conclusion as to the sense in which Freud is using the word. Thus, throughout the book '*Witz*' has been rendered 'joke' and '*Scherz*' 'jest'. There is great trouble with the adjective '*witzig*', which is used here in most cases simply as the qualifying adjective to '*Witz*'. The *Concise Oxford Dictionary* actually gives, without comment, an adjective 'joky'. The word would have saved the translator innumerable clumsy periphrases, but he confesses that he had not the nerve to use it. The only places in which '*Witz*' has been
[8] translated 'wit' are two or three (e.g. on p. 122 below) in which the German word is used (as explained in footnote 1 below) for the mental function and not for the product, and where there seemed no possible English alternative.

There are other, though less severe, difficulties over the German '*das Komische*' and '*die Komik*'. An attempt to differentiate between these, and to use 'the comic' for the first and 'comicality' for the second, was abandoned in view of the passage at the end of the paragraph at the top of p. 126, where the two different words are used in successive sentences, quite evidently in the same sense and merely for the purpose of 'elegant variation'. So that the very stilted English 'the comic' has been systematically adopted for both German words.

Lastly, it may be remarked that the English word 'humour', which is of course

1 '*Der Witz*', incidentally, is used both for the mental faculty and for its product – for 'wittiness' and 'the witticism', to use renderings that have been rejected here. The German word can be used besides, in a much vaguer sense, for 'ingenuity'; but the English 'wit', for that matter, also has its wider usages.

used for the German '*Humor*', sounds here decidedly unnatural to English ears in some of its contexts. The fact is that the word seems to be rarely used by itself today: it hardly occurs except in the phrase 'sense of humour'. But here again the reader will be in a position to decide for himself the meaning which Freud attaches to the word.

It is much to be hoped that these difficulties, which are after all only superficial ones, will not deter readers at the outset. The book is full of fascinating material, much of which reappears in no other of Freud's writings. The detailed accounts it contains of complicated psychological processes have no rivals outside *The Interpretation of Dreams*, and it is indeed a product of the same burst of genius which gave us that great work.

We owe to Ilse Grubrich-Simitis (1993, 151–3; trans., 113–15, slightly revised here) the discovery of the remarkable fact that Freud's first notes for this work have been preserved for posterity. These undated notes, recorded on the reverse side of a reused fragment of paper, may now aptly serve as an introduction to the fuller account of the complicated psychological processes at hand:

(a) Technique of jokes.
(b) Psychogenesis of jokes.
(c) Purpose of jokes.
(d) Jokes and the comic.
(e) Jokes and riddles.
(f) Theory of pleasure in jokes.

Alongside the first two lines the following two lines appear, bracketed together:

Joke –	Comic –	Riddle
Ucs.	Pcs.	Cs.

On the right-hand side of the page the following addendum appears, after the two bracketed lines:

Perhaps also irony, satire, etc.

The note then continues on the left margin:

Important aspect of characterization of different species of pleasure-gain through psychical localization.

Book of riddles by Mises,[1] Polle. – *Aspects*:
Joke lies in technique – reduction.
Psychical localization.
Economy theory.
Laughing with satiety.
Preliminary stage of jesting.
(a) Lifting of inhibitions.
(b) Original sources of pleasure.

1 Mises was Fechner's pseudonym; see p. 59 *n.* 1 below.

JOKES AND THEIR RELATION TO THE UNCONSCIOUS

A. ANALYTIC PART

I
INTRODUCTION

[1]

Anyone who has at any time had occasion to enquire from the literature [9]
of aesthetics and psychology what light can be thrown on the nature of jokes and on the position they occupy will probably have to admit that jokes have not received nearly as much philosophical consideration as they deserve in view of the part they play in our mental life [*Geistesleben*][T]. Only a small number of thinkers can be named who have *Geist*
entered at all deeply into the problems of jokes. Among those who have discussed jokes, however, are such famous names as those of the novelist Jean Paul (Richter) and of the philosophers Theodor Vischer, Kuno Fischer and Theodor Lipps. But even with these writers the subject of jokes lies in the background, while the main interest of their enquiry is turned to the more comprehensive and attractive problem of the comic.

The first impression one derives from the literature is that it is quite impracticable to deal with jokes otherwise than in connection with the comic.

According to Lipps (1898),[1] a joke is 'something comic which is entirely subjective' – that is, something comic 'which *we* produce, which is attached to action of ours as such, to which we invariably stand in the relation of subject and never of object, not even of voluntary object' (ibid., 80). This is explained further by a remark to the effect that in general we call a joke 'any conscious and successful evocation of what is comic, whether the comic of observation or of situation' (ibid., 78).

Fischer (1889) illustrates the relation of jokes to the comic with the [10]
help of caricature, which in his account he places between them. The comic is concerned with the ugly in one of its manifestations: 'If it [what is ugly] is concealed, it must be uncovered in the light of the comic way

1 It is this book that has given me the courage to undertake this attempt as well as the possibility of doing so.

of looking at things; if it is noticed only a little or scarcely at all, it must be brought forward and made obvious, so that it lies clear and open to the light of day . . . In this way caricature comes about.' (Ibid., 45.) – 'Our whole spiritual world, the intellectual kingdom of our thoughts and ideas [*Vorstellungen*]^{T}, does not unfold itself before the gaze of external observation, it cannot be directly imagined pictorially and visibly; and yet it too contains its inhibitions [*Hemmungen*]^{T}, its weaknesses and its deformities – a wealth of ridiculous and comic contrasts. In order to emphasize these and make them accessible to aesthetic consideration, a force is necessary which is able not merely to imagine objects directly but itself to reflect on these images and to clarify them: a force that can illuminate thoughts. The only such force is *judgement*. A joke is a judgement which produces a comic contrast; it has already played a silent part in caricature, but only in judgement does it attain its peculiar form and the free sphere of its unfolding.' (Ibid., 49–50.)

It will be seen that the characteristic which distinguishes the joke within the class of the comic is attributed by Lipps to action, to the active behaviour of the subject, but by Fischer to its relation to its *object*, which he considers is the concealed ugliness of the world of thoughts. It is impossible to test the validity of these definitions of the joke – indeed, they are scarcely intelligible – unless they are considered in the context from which they have been torn. It would therefore be necessary to work through these authors' accounts of the comic before anything could be learnt from them about jokes. Other passages, however, show us that these same authors are able to describe essential and generally valid characteristics of the joke without any regard to its connection with the comic.

The characterization of jokes which seems best to satisfy Fischer himself is as follows: 'A joke is a *playful* judgement.' (Ibid., 51.) By way of illustration of this, we are given an analogy: 'just as aesthetic freedom lies in the playful contemplation of things' (ibid., 50). Elsewhere (ibid., 20) the aesthetic attitude towards an object is characterized by the
[11] condition that we do not ask anything of the object, especially no satisfaction of our serious needs, but content ourselves with the enjoyment of contemplating it. The aesthetic attitude is *playful* in contrast to work. – 'It might be that from aesthetic freedom there might spring too a sort of judging released from its usual rules and regulations, which, on account of its origin, I will call a "playful judgement", and that in this concept is contained the first determinant, if not the whole formula, that will solve our problem. "Freedom

produces jokes and jokes produce freedom", wrote Jean Paul.[t] "Joking is merely playing with ideas."" (Ibid., 24.)[1]

A favourite definition of joking has long been the ability to find similarity between dissimilar things – that is, hidden similarities. Jean Paul has expressed this thought itself in a joking form: 'Joking is the disguised priest who weds every couple.' Vischer [1846–57, **1**, 422] carries this further: 'He likes best to wed couples whose union their relatives frown upon.' Vischer objects, however, that there are jokes where there is no question of comparing – no question, therefore, of finding a similarity. So he, slightly diverging from Jean Paul, defines joking as the ability to bind into a unity, with surprising rapidity, several ideas which are in fact alien to one another both in their internal content and in the nexus to which they belong. Fischer, again, stresses the fact that in a large number of joking judgements *differences* rather than similarities are found, and Lipps points out that these definitions relate to joking as an ability possessed by the joker and not to the jokes which he makes.

Other more or less interrelated ideas which have been brought up as defining or describing jokes are: 'a contrast of ideas', 'sense in nonsense', 'bewilderment and illumination'.

Definitions such as that of Kraepelin[2] lay stress on contrasting ideas. A joke is 'the arbitrary connecting or linking, usually by means of a verbal association, of two ideas which in some way contrast with each other'. A critic like Lipps had no difficulty in showing the total inadequacy of this formula; but he does not himself exclude the factor of contrast, but merely displaces it elsewhere. 'The contrast remains, but it is not some contrast between the ideas attached to the words, but a contrast or contradiction between the meaning and the meaninglessness of the words.' (Lipps, 1898, 87.) He gives examples to show how this is to be understood. 'A contrast arises only because . . . we grant its words a meaning which, again, we nevertheless cannot grant them.' (Ibid., 90.) [12]

If this last point is developed further, the contrast between 'sense and nonsense' becomes significant. 'What at one moment has seemed to us to have a meaning, we now see is completely meaningless. That is what, in this case, constitutes the comic process . . . A remark seems to us to be a joke, if we attribute a significance to it that has psychological necessity and, as soon as we have done so, deny it again. Various things can be understood by this "significance". We attach *sense* to a remark and know that logically it cannot have any. We discover *truth* in it, which nevertheless, according to the laws of experience or our general habits of

1 [Jean Paul Richter, 1804, Part II, Paragraph 51.]

2 [Kraepelin, 1885, 143.]

thought, we cannot find in it. We grant it logical or practical consequences in excess of its true content, only to deny these consequences as soon as we have clearly recognized the nature of the remark. In every instance, the psychological process which the joking remark provokes in us, and on which the feeling of the comic rests, consists in the immediate transition, from this attaching of sense, from this discovering of truth, and from this granting of consequences, to the consciousness or impression of relative nothingness.' (Lipps, 1898, 85.)

However penetrating this discussion may sound, the question may be raised here whether the contrast between what has meaning and what is meaningless, on which the feeling of the *comic* is said to rest, also contributes to defining the concept of the *joke* insofar as it differs from that of the comic.

The factor of 'bewilderment and illumination', too, leads us deep into the problem of the relation of the joke to the comic. Kant[1] says of the comic in general that it has the remarkable characteristic of being able to deceive us only for a moment. Heymans (1896) explains how the effect of a joke comes about through bewilderment being succeeded by illumination. He illustrates his meaning by a brilliant joke of Heine's, who makes
[13] one of his characters, Hirsch-Hyacinth, the poor lottery agent, boast that the great Baron Rothschild had treated him quite as his equal – quite 'famillionairely'. Here the word that is the vehicle of the joke appears at first simply to be a wrongly constructed word, something unintelligible, incomprehensible, puzzling. It accordingly bewilders. The comic effect is produced by the solution of this bewilderment, by understanding the word. Lipps (1898, 95) adds to this that this first stage of enlightenment – that the bewildering word means this or that – is followed by a second stage, in which we realize that this meaningless word has bewildered us and has then shown us its true meaning. It is only this second illumination, this discovery that a word which is meaningless by normal linguistic usage has been responsible for the whole thing – this resolution of the problem into nothing – it is only this second illumination that produces the comic effect.

Whether the one or the other of these two views seems to us to throw more light on the question, the discussion of bewilderment and enlightenment brings us closer to a particular discovery. For if the comic effect of Heine's 'famillionairely' depends on the solution of the apparently meaningless word, the 'joke' must no doubt be ascribed to the formation of that word and to the characteristics of the word thus formed.

1 [Kant, *Kritik der Urteilskraft*, Part I, Section 1, 54.]

Another peculiarity of jokes, quite unrelated to what we have just been considering, is recognized by all the authorities as essential to them. '*Brevity* is the body and the soul of wit, it is its very self,' says Jean Paul (1804, Part II, Paragraph 42), merely modifying what the old chatterbox Polonius says in Shakespeare's *Hamlet* (Act II, Scene 2):

> 'Therefore, since brevity is the soul of wit
> And tediousness the limbs and outward flourishes,
> I will be brief.'

In this connection the account given by Lipps (1898, 90) of the brevity of jokes is significant: 'A joke says what it has to say, not always in few words, but in *too* few words – that is, in words that are insufficient by strict logic or by common modes of thought and speech. It may even actually say what it has to say by not saying it.'

We have already learnt from the connection of jokes with caricature that they 'must bring forward something that is concealed or hidden' [14] (Fischer, 1889, 51). I lay stress on this determinant once more, because it too has more to do with the nature of jokes than with their being part of the comic.

[2]

I am well aware that these scanty extracts from the works of writers upon jokes cannot do them justice. In view of the difficulties standing in the way of my giving an unmistakably correct account of such complicated and subtle trains of thought, I cannot spare curious enquirers the labour of obtaining the information they desire from the original sources. But I am not sure that they will come back fully satisfied. The criteria and characteristics of jokes brought up by these authors and collected above – activity, relation to the content of our thoughts, the characteristic of playful judgement, the coupling of dissimilar things, contrasting ideas, 'sense in nonsense', the succession of bewilderment and enlightenment, the bringing forward of what is hidden, and the peculiar brevity of wit – all this, it is true, seems to us at first sight so very much to the point and so easily confirmed by instances that we cannot be in any danger of underrating such views. But they are *disjecta membra*, which we should like to see combined into an organic whole. When all is said and done, they contribute to our knowledge of jokes no more than would a series of anecdotes to the description of some personality of whom we have a right to ask for a biography. We are entirely without

insight into the connection that presumably exists between the separate determinants – what, for instance, the brevity of a joke can have to do with its characteristic of being a playful judgement. We need to be told, further, whether a joke must satisfy *all* these determinants in order to be a proper joke, or need satisfy only *some*, and if so which can be replaced by others and which are indispensable. We should also wish to have a grouping and classification of jokes on the basis of the characteristics considered essential. The classification that we find in the literature rests on the one hand on the technical methods employed in them (e.g. punning or play upon words) and on the other hand on the use made of them in speech (e.g. jokes used for the purposes of caricature or of characterization, or joking snubs).

[15] We should thus find no difficulty in indicating the aims of any new attempt to throw light on jokes. To be able to count on success, we should have either to approach the work from new angles or to endeavour to penetrate further by increased attention and deeper interest. We can resolve that we will at least not fail in this last respect. It is striking with what a small number of instances of jokes recognized as such the authorities are satisfied for the purposes of their enquiries, and how each of them takes the same ones over from his predecessors. We must not shirk the duty of analysing the same instances that have already served the classical authorities on jokes. But it is our intention to turn besides to fresh material so as to obtain a broader foundation for our conclusions. It is natural then that we should choose as the subjects of our investigation examples of jokes by which we ourselves have been most struck in the course of our lives and which have made us laugh the most.

Is the subject of jokes worth so much trouble? There can, I think, be no doubt of it. Leaving on one side the personal motives which make me wish to gain an insight into the problems of jokes and which will come to light in the course of these studies, I can appeal to the fact that there is an intimate connection between all mental happenings – a fact which guarantees that a psychological discovery even in a remote field will be of an unpredictable value in other fields. We may also bear in mind the peculiar and even fascinating charm exercised by jokes in our society. A new joke acts almost like an event of universal interest; it is passed from one person to another like the news of the latest victory. Even men of eminence who have thought it worthwhile to tell the story of their origins, of the cities and countries they have visited, and of the important people with whom they have associated, are not ashamed in their autobiographies to report their having heard some excellent joke.[1]

1 Von Falke's *Memoirs*, 1897.

II
THE TECHNIQUE OF JOKES

[1]

Let us follow up a lead presented to us by chance and consider the first [16]
example of a joke that we came across in the preceding chapter.

In the part of his *Reisebilder* entitled 'Die Bäder von Lucca' ['The Baths of Lucca'] Heine introduces the delightful figure of the lottery agent and extractor of corns, Hirsch-Hyacinth of Hamburg, who boasts to the poet of his relations with the wealthy Baron Rothschild, and finally says: 'And, as true as God shall grant me all good things, Doctor, I sat beside Salomon Rothschild and he treated me quite as his equal – quite famillionairely.'[1]

Heymans and Lipps used this joke (which is admittedly an excellent and most amusing one) to illustrate their view that the comic effect of jokes is derived from 'bewilderment and illumination' (see above [p. 12]). We, however, will leave that question on one side and ask another: 'What is it that makes Hirsch-Hyacinth's remark into a joke?' There can be only two possible answers: either the thought expressed in the sentence possesses in itself the character of being a joke or the joke resides in the expression which the thought has been given in the sentence. In whichever of these directions the character of being a joke may lie, we will pursue it further and try to lay hands on it.

A thought can in general be expressed in various linguistic forms – in various words, that is – which can represent it with equal aptness. Hirsch-Hyacinth's remark presents his thought in a particular form of expression and, as it seems to us, a specially odd form and not the one which is most easily intelligible. Let us try to express the same thought as accurately as possible in other words. Lipps has already done so, and in that way has to some extent explained the poet's intention. He writes (1898, 87): 'Heine, as we understand it, means to say that his [Hyacinth's] [17]
reception was on familiar terms – of the not uncommon kind, which does not as a rule gain in agreeableness from having a flavour of millionairedom about it.' We shall not be altering the sense of this if we give it another shape which perhaps fits better into Hirsch-Hyacinth's speech: 'Rothschild treated me quite as his equal, quite familiarly – that is, so far

1 [*Reisebilder* III, Part II, Chapter VIII.]

as a millionaire can.' 'A rich man's condescension', we should add, 'always involves something not quite pleasant for whoever experiences it.'[1]

Whether, now, we keep to the one or the other of the two equally valid texts of the thought, we can see that the question we asked ourselves is already decided. In this example the character of being a joke does not reside in the thought. What Heine has put into Hirsch-Hyacinth's mouth is a correct and acute observation, an observation of unmistakable bitterness, which is understandable in a poor man faced with such great wealth; but we should not venture to describe it as in the nature of a joke. If anyone is unable in considering the translation to get away from his recollection of the shape given to the thought by the poet, and thus feels that nevertheless the thought in itself is also in the nature of a joke, we can point to a sure criterion of the joking character having been lost in the translation. Hirsch-Hyacinth's remark made us laugh aloud, whereas its accurate translation by Lipps or our own version of it, though it may please us and make us reflect, cannot possibly raise a laugh.

But if what makes our example a joke is not anything that resides in its thought, we must look for it in the form, in the wording in which it is expressed. We have only to study the peculiarity of its form of expression to grasp what may be termed the verbal or expressive technique of this joke, something which must stand in an intimate relation with the essence of the joke, since, if it is replaced by something else, the character
[18] and effect of the joke disappear. Moreover, in attributing so much importance to the verbal form of jokes we are in complete agreement with the authorities. Thus Fischer (1889, 72) writes: 'It is in the first place its sheer *form* that makes a judgement into a joke, and we are reminded of a saying of Jean Paul's which, in a single aphorism, explains and exemplifies this precise characteristic of jokes – "Such is the victorious power of sheer position, whether among warriors or words."'

In what, then, does the 'technique' of this joke consist? What has happened to the thought, as expressed, for instance, in our version, in order to turn it into a joke that made us laugh so heartily? Two things – as we learn by comparing our version with the poet's text. First, a considerable *abbreviation* has occurred. In order to express fully the thought contained in the joke, we were obliged to add to the words 'R. treated me quite as his equal, quite familiarly' a postscript which, reduced to its shortest terms, ran 'that is, so far as a millionaire can'. And even so we

1 We shall return to this same joke later on [p. 122 below]; and we shall then have occasion to make a correction in the translation of it given by Lipps which our own version has taken as its starting point. This, however, will not affect the discussion that follows here. [It may be remarked that '*familiär*' can also have the meaning of 'belonging to the family'.]

felt the need for a further explanatory sentence.[1] The poet puts it far more briefly: 'R. treated me quite as his equal – quite famillionairely.' In the joke, the whole limitation added by the second sentence to the first, which reports the familiar treatment, has disappeared.

But not quite without leaving a substitute from which we can reconstruct it. For a second change has also been made.[2] The word '*familiär*' [familiarly] in the unjoking expression of the thought has been transformed in the text of the joke into '*famillionär*' [famillionairely]; and there can be no doubt that it is precisely on this verbal structure that the joke's character as a joke and its power to cause a laugh depend. The newly constructed word coincides in its earlier portion with the '*familiär*' of the first sentence, and in its final syllables with the '*Millionär*' [millionaire] of the second sentence. It stands, as it were, for the '*Millionär*' portion of the second sentence and thus for the *whole* second sentence, and so puts us in a position to infer the second sentence that has been omitted in the text of the joke. It can be described as a [19]
'composite structure' made up of the two components '*familiär*' and '*Millionär*', and it is tempting to give a diagrammatic picture of the way in which it is derived from those two words:[3]

FAMILI ÄR
MILIONÄR
FA**MILI***ON***ÄR**

The process which has converted the thought into a joke can then be represented in the following manner, which may at first sight seem fantastic, but nevertheless produces precisely the outcome that is really before us:

'R. treated me quite *familiär*,
that is, so far as a *Millionär* can.'

1 This is equally true of Lipps's translation.

2 [Although this example has so far borne translation into English comparatively well, what follows can make its precise effect only if the German words are given. The main point of difference is that in German the adverbial form does not require the addition of 'ly' to the adjective.]

3 The two words are printed one in Roman and the other in italic type, and the syllables common to them both are printed in bold type. The second 'l', which is scarcely pronounced, could of course be left out of account. It seems probable that the fact of the two words having several syllables in common offered the joke technique the occasion for constructing the composite word.

Let us now imagine that a compressing force is brought to bear on these sentences and that for some reason the second is the less resistant one. It is thereupon made to disappear, while its most important constituent, the word '*Millionär*', which has succeeded in rebelling against being suppressed, is, as it were, pushed up against the first sentence, and fused with the element of that sentence which is so much like it – '*familiär*'. And the chance possibility, which thus arises, of saving the essential part of the second sentence actually favours the dissolution of its other, less important, constituents. The joke is thus generated:

'R. treated me quite *famili on är*.'

(*mili*) (*är*)

If we leave out of account any such compressing force, which indeed is unknown to us, the process by which the joke is formed – that is, the joke technique – in this instance might be described as 'condensation [*Verdichtung*]^{T} accompanied by the formation of a substitute'; and in the
[20] present example the formation of the substitute consists in the making of a 'composite word'. This composite word '*famillionär*', which is unintelligible in itself but is immediately understood in its context and recognized as being full of meaning, is the vehicle of the joke's laughter-compelling effect – the mechanism of which, however, is not made in any way clearer by our discovery of the joke technique. In what way can a linguistic process of condensation, accompanied by the formation of a substitute by means of a composite word, give us pleasure [*Lust*]^{T} and make us laugh? This is evidently a different problem, whose treatment we may postpone till we have found a way of approaching it. For the present we will keep to the technique of jokes.

Our expectation that the technique of jokes cannot be a matter of indifference from the point of view of discovering their essence leads us at once to enquire whether there are other examples of jokes constructed like Heine's '*famillionär*'. There are not very many of them, but nevertheless enough to make up a small group which are characterized by the formation of composite words. Heine himself has derived a second joke from the word '*Millionär*' – copying from himself, as it were. In Chapter XIV of his 'Ideen'[1] he speaks of a '*Millionarr*', which is an obvious combination of '*Millionär*' and '*Narr*'[2] and, just as in the first example, brings out a suppressed subsidiary thought.

1 [*Reisebilder* II.]

2 [The German for 'fool'.]

Here are some other examples I have come upon. – There is a certain fountain [*Brunnen*] in Berlin, the erection of which brought the chief burgomaster Forckenbeck into much disfavour. The Berliners call it the '*Forckenbecken*', and there is certainly a joke in this description, even though it was necessary to replace the word '*Brunnen*' with its obsolete equivalent '*Becken*' in order to combine it into a whole with the name of the burgomaster. – The voice of Europe once made the cruel joke of changing a potentate's name from Leopold to Cleopold, on account of the relations he had at one time with a lady with the first name of Cleo. This undoubted product of condensation keeps alive an annoying allusion at the cost of a single letter. – Proper names in general fall easy victim to this kind of treatment by the joke technique. There were in Vienna two brothers named Salinger, one of whom was a *Börsensensal* [stockbroker; *Sensal* = broker]. This provided a handle for calling him [21]
'Sensalinger', while his brother, to distinguish him, was given the unflattering name of 'Scheusalinger'.[1] This was convenient, and certainly a joke; I cannot say whether it was justified. But jokes do not as a rule enquire much into that.

I have been told the following condensation joke. A young man who had hitherto led a gay life abroad paid a call, after a considerable absence, on a friend living here. The latter was surprised to see an *Ehering* [wedding ring] on his visitor's hand. 'What?' he exclaimed, 'are you married?' 'Yes', was the reply, '*Trauring* but true.'[2] The joke is an excellent one. The word '*Trauring*' combines both components: '*Ehering*' changed into '*Trauring*' and the sentence '*traurig*, *aber wahr*' [sad but true]. The effect of the joke is not interfered with by the fact that here the composite word is not, like '*famillionär*', an unintelligible and otherwise non-existent structure, but one which coincides entirely with one of the two elements represented.

In the course of conversation I myself once unintentionally provided the material for a joke that is once again quite analogous to '*famillionär*'. I was talking to a lady about the great services that had been rendered by a man of science whom I considered had been unjustly neglected. 'Why,' she said, 'the man deserves a monument.' 'Perhaps he will get one some day,' I replied, 'but *momentan* [for the moment] he has very little success.' '*Monument*' and '*momentan*' are opposites. The lady proceeded to unite them: 'Well, let us wish him a *monumentan*[3] success.'

1 ['*Scheusal*' means 'monstrous creature'.]

2 ['*Traurig*' would have meant 'sad'. '*Trauring*' is a synonym for '*Ehering*'.]

3 [A non-existent word. '*Monumental*' (as in English) would have been expected.]

I owe a few examples in foreign languages,[1] which show the same mechanism of condensation as our '*famillionär*', to an excellent discussion of the same subject in English by A. A. Brill (1911).

The English author De Quincey, Brill tells us, somewhere remarked
[22] that old people are inclined to fall into their 'anecdotage'. This word is a fusion of the partly overlapping words

ANECDOTE
and DOTAGE.

In an anonymous short story Brill once found the Christmas season described as 'the alcoholidays' – a similar fusing of

ALCOHOL
and HOLIDAYS.

After Flaubert had published his celebrated novel *Salammbô*, the scene of which is laid in ancient Carthage, Sainte-Beuve laughed at it, on account of its elaboration of detail, as being 'Carthaginoiserie';

CARTHAGINOIS
CHINOISERIE.

But the best example of a joke of this group originated from one of the leading men in Austria, who, after important scientific and public work, now fills one of the highest offices in the state. I have ventured to make use of the jokes which are ascribed to him, and all of which in fact bear the same impress, as material for these researches,[2] above all because it would have been hard to find any better.

Herr N.'s attention was drawn one day to the figure of a writer who had become well known from a series of undeniably boring essays which he had contributed to a Vienna daily paper. All of these essays dealt with small episodes in the relations of the first Napoleon with Austria. The author had red hair. As soon as Herr N. heard his name

1 [This paragraph and the three examples that follow were added in 1912.]

2 Have I the right to do so? At least I have not obtained my knowledge of these jokes through an indiscretion. They are generally known in this city (Vienna) and are to be found in everyone's mouth. A number of them have been given publicity by Eduard Hanslick [the famous musical critic] in the *Neue Freie Presse* and in his autobiography [Hanslick, 1894]. As regards the others, I must offer my apologies for any possible distortions, which, in the case of oral tradition, are scarcely to be avoided. [It seems likely that Herr N. was Josef Unger (1828–1913), Professor of Jurisprudence and from 1881 President of the Supreme Court.]

mentioned he asked: 'Is not that the *roter Fadian*[1] that runs through the story of the Napoleonids?'

In order to discover the technique of this joke, we must apply to it the [23]
process of reduction[2] which gets rid of the joke by changing the mode of expression and instead introducing the original complete meaning, which can be inferred with certainty from a good joke. Herr N.'s joke about the '*roter Fadian*' proceeds from two components – a depreciatory judgement upon the writer and a recollection of the famous simile with which Goethe introduces the extracts 'From Ottilie's Diary' in the *Wahlverwandtschaften*.[3] The ill-tempered criticism may have run: 'So this is the person who is for ever and ever writing nothing but boring stories about Napoleon in Austria!' Now this remark is not in the least a joke. Nor is Goethe's pretty analogy a joke, and it is certainly not calculated to make us laugh. It is only when the two are brought into connection with each other and submitted to the peculiar process of condensation and fusion that a joke emerges – and a joke of the first order.[4]

The linking of the disparaging judgement upon the boring historian with the pretty analogy in the *Wahlverwandtschaften* must have taken place (for reasons which I cannot yet make intelligible) in a less simple manner than in many similar cases. I shall try to represent what was [24]
probably the actual course of events by the following construction. First, the element of the constant recurrence of the same theme in the stories may have awoken a faint recollection in Herr N. of the familiar passage in the *Wahlverwandtschaften*, which is as a rule wrongly quoted: 'it runs like a *roter Faden*' [scarlet thread]. The '*roter Faden*' of the analogy now exercised a modifying influence on the expression of the first sentence, as a result of the chance circumstance that the person insulted was also

1 ['*Roter*' means 'red', 'scarlet'. '*Fadian*' means 'dull fellow'. The termination '*-ian*' is occasionally added to an adjective, giving the somewhat contemptuous sense of 'fellow'. Thus '*grob*' means 'coarse', '*Grobian*' means 'coarse fellow'; '*dumm*' means 'stupid', '*Dummian*' means 'stupid fellow'. The adjective '*fade*' or '*fad*' means (like its French equivalent) 'insipid', 'dull'. Finally, '*Faden*' means 'thread'. If all this is borne in mind, what follows will be intelligible.]

2 [Here and elsewhere in this work Freud uses the word 'reduction' in the sense of taking something back to its original form. He had already carried out this process in the case of the Heine joke above, p. 15 f. Similarly with the verb 'to reduce': see, for instance, p. 24 below.]

3 'We hear of a peculiar practice in the English navy. Every rope in the king's fleet, from the strongest to the weakest, is woven in such a way that a *roter Faden* [scarlet thread] runs through its whole length. It cannot be extracted without undoing the whole rope, and it proves that even the smallest piece is crown property. In just the same way a thread of affection and dependence runs through Ottilie's diary, binding it all together and characterizing the whole of it.' (Goethe [*Elective Affinities*], Sophienausgabe, **20**, 212.)

4 I need hardly point out how little this observation, which can invariably be made, fits in with the assertion that a joke is a playful judgement [p. 10 above].

rot [red] – that is to say had red hair. It may then have run: 'So it is that red person who writes the boring stories about Napoleon!' And now the process began which brought about the condensation of the two pieces. Under its pressure, which had found its first fulcrum in the sameness of the element '*rot*', the 'boring' was assimilated to the '*Faden*' [thread] and was changed into '*fad*' [dull]; after this the two components were able to fuse together into the actual text of the joke, in which, in this case, the quotation has an almost greater share than the derogatory judgement, which was undoubtedly present alone to begin with.

'So it is that *red* person who writes this *fade* stuff about N[apoleon]. The *red* *Faden* that runs through everything.'

'Is not that the *red Fadian* that runs through the story of the N[apoleonids]?'

In a later chapter [p. 91 below] I shall add a justification, but also a correction, to this account, when I come to analyse this joke from points of view other than purely formal ones. But whatever else about it may be in doubt, there can be no question that a condensation has taken place. The result of the condensation is, on the one hand, once again a considerable abbreviation; but on the other hand, instead of the formation of a striking composite word, there is an interpenetration of the constituents of the two components. It is true that '*roter Fadian*' would be capable of existing as a mere term of abuse; but in our instance it is certainly a product of condensation.

If at this point a reader should become indignant at a method of approach which threatens to ruin his enjoyment of jokes without being able
[25] to throw any light on the source of that enjoyment, I would beg him to be patient for the moment. At present we are only dealing with the technique of jokes; and the investigation even of this promises results, if we pursue it sufficiently far.

The analysis of the last example has prepared us to find that, if we meet with the process of condensation in still other examples, the substitute for what is suppressed may be not a composite structure, but some other alteration of the form of expression. We can learn what this other form of substitute may be from another of Herr N.'s jokes.

'I drove with him *tête-à-bête*.' Nothing can be easier than the reduction of this joke. Clearly it can only mean: 'I drove with X *tête-à-tête*, and X is a stupid ass.'

Neither of these sentences is a joke. They could be put together: 'I drove with that stupid ass X *tête-à-tête*', and that is not a joke either. The joke arises only if the 'stupid ass' is left out, and, as a substitute for it, the 't' in one '*tête*' is turned into a 'b'. With this slight modification the suppressed 'ass' has nevertheless once more found expression. The technique of this group of jokes can be described as 'condensation accompanied by slight modification', and it may be suspected that the slighter the modification[1] the better will be the joke.

The technique of another joke is similar, though not without its complication. In the course of a conversation about someone in whom there was much to praise, but much to find fault with, Herr N. remarked: 'Yes, vanity is one of his four Achilles heels.'[2] In this case the slight modification consists in the fact that, instead of the *one* Achilles heel which the hero himself must have possessed, *four* are here in question. Four heels – but only an ass[3] has four heels. Thus the two thoughts that are condensed in the joke ran: 'Apart from his vanity, Y is an eminent man; all the same I don't like him – he's an ass rather than a man.'[4]

I happened to hear another similar, but much simpler, joke *in statu nascendi* in a family circle. Of two brothers at school, one was an excellent and the other a most indifferent scholar. Now it happened once that the exemplary boy too came to grief at school; and their mother referred to this while expressing her concern that it might mean the beginning of a lasting deterioration. The boy who had hitherto been overshadowed by his brother readily grasped the opportunity. 'Yes', he said, 'Karl's going backwards on all fours.' [26]

The modification here consists in a short addition to the assurance that he too was of the opinion that the other boy was going backwards. But this modification represented and replaced a passionate plea on his own behalf: 'You mustn't think he's so much cleverer than I am simply because he's more successful at school. After all he's only a stupid ass – that's to say, much stupider than I am.'

Another, very well-known joke of Herr N.'s offers a neat example of condensation with slight modification. He remarked of a personage in

1 [In the editions before 1925, this read 'substitutive modification'.]

2 [*Footnote added* 1912:] It seems that this joke was applied earlier by Heine to Alfred de Musset.

3 [In this and in the previous example the actual term of abuse in German is '*Vieh*', whose literal meaning is more generally 'animal'.]

4 One of the complications in the technique of this example lies in the fact that the modification by which the omitted insult is replaced must be described as an *allusion* to the latter, since it only leads to it by a process of inference. For another factor that complicates the technique here, see below [p. 90 f.].

public life: 'he has a great future behind him.' The man to whom this joke referred was comparatively young, and he had seemed destined by his birth, education and personal qualities to succeed in the future to the leadership of a great political party and to enter the government at its head. But times changed; the party became inadmissible as a government, and it could be foreseen that the man who had been predestined to be its leader would come to nothing as well. The shortest reduced[1] version by which this joke could be replaced would run: 'The man has had a great future before him, but he has it no longer.' Instead of the 'had' and the second clause, there was merely the small change made in the principal clause of replacing 'before' with its contrary, 'behind'.[2]

[27] Herr N. made use of almost the same modification in the case of a gentleman who became Minister for Agriculture with the sole qualification of being himself a farmer. Public opinion had occasion to recognize that he was the least gifted holder of the office that there had ever been. When he had resigned his office and retired to his farming interests, Herr N. said of him, 'Like Cincinnatus, he has gone back to his place before the plough.'

The Roman, however, who had also been called away to office from the plough, returned to his place *behind* the plough. What went *before* the plough, both then and today, was only – an ox.[3]

Karl Kraus[4] was responsible for another successful condensation with slight modification. He wrote of a certain yellow-press journalist that he had travelled to one of the Balkan States by '*Orienterpresszug*'.[5] There is no doubt that this word combines two others: '*Orientexpresszug*' [Orient Express] and '*Erpressung*' [blackmail]. Owing to the context, the element '*Erpressung*' emerges only as a modification of the '*Orientexpresszug*' – a word called for by the verb ['travelled']. This joke, which presents itself in the guise of a misprint, has yet another claim on our interest.[6]

1 [See footnote 2, p. 21 above.]

2 There is another factor operating in the technique of this joke which I reserve for later discussion. It concerns the actual nature of the modification (representation by the opposite [p. 61 ff. below] or by something absurd [p. 49 ff.]). There is nothing to prevent the joke technique from simultaneously employing several methods; but these we can only get to know one by one.

3 ['*Ochs*' in German has much the same meaning as 'ass' in English.]

4 [In the 1905 edition only, this read 'A witty writer'. Karl Kraus was a celebrated Viennese journalist and editor. See also below, p. 68.]

5 [A non-existent word, explained by what follows.]

6 [As being on the borderline between a joke and a parapraxis. Cf. *The Psychopathology of Everyday Life* (1901*b*), Chapter VI (B), Examples 19 ff.; *RSE*, **6**, 112.]

This series of examples could easily be further increased; but I do not think we require any fresh instances to enable us to grasp clearly the characteristics of the technique in this second group – condensation with modification. If we compare the second group with the first, whose technique consisted in condensation with the formation of composite words, we shall easily see that the difference between them is not an essential one and that the transitions between them are fluid. Both the formation of composite words and modification can be subsumed under the concept of the formation of substitutes; and, if we care to, we can also describe the formation of a composite word as a modification of the basic word by a second element.

[2]

But here we may make a first stop and ask ourselves with what factor [28]
known to us from the literature of the subject this first finding of ours coincides, wholly or in part. Evidently with the factor of brevity, which Jean Paul describes as 'the soul of wit' (p. 13 above). But brevity does not in itself constitute a joke, or otherwise every laconic remark would be one. The joke's brevity must be of a particular kind. It will be recalled that Lipps has tried to describe this particular brevity of jokes more precisely (p. 13). Here our investigation contributes something and shows that the brevity of jokes is often the outcome of a particular process which has left behind in the wording of the joke a second trace – the formation of a substitute. By making use of the procedure of reduction, which seeks to undo the peculiar process of condensation, we also find, however, that the joke depends entirely on its verbal expression as established by the process of condensation. Our whole interest now turns, of course, to this strange process, which has hitherto scarcely been examined. Nor can we in the least understand how all that is valuable in a joke, the yield of pleasure that the joke brings us, can originate from that process.

Are processes similar to those which we have described here as the technique of jokes known already in any other field of mental events? They are – in a single field, and an apparently very remote one. In 1900 I published a book which, as its title (*The Interpretation of Dreams*) indicates, attempted to throw light on what is puzzling in dreams and to establish them as derivatives of our normal mental functioning. I found occasion there to contrast the *manifest*, and often strange, *content of the dream* with the *latent*, but perfectly logical, *dream thoughts* from

which the dream is derived; and I entered into an investigation of the processes which make the dream out of the latent dream thoughts, as well as of the psychical forces which are involved in that transformation. To the totality of these transforming processes I gave the name of the 'dream-work'; and I have described as a part of this dream-work a process of condensation which shows the greatest similarity to the one found in the technique of jokes – which, like it, leads to abbreviation, and
[29] creates substitute formations of the same character. Everyone will be familiar, from a recollection of his own dreams, with the composite structures both of people and of things which emerge in dreams.[1] Indeed, dreams even construct them out of words, and they can then be dissected in analysis. (For instance, 'Autodidasker' = 'Audodidakt' + 'Lasker'.)[2] On other occasions – much more often, in fact – what the work of condensation in dreams produces is not composite structures but pictures which exactly resemble one thing or one person except for an addition or alteration derived from another source – modifications, that is, just like those in Herr N.'s jokes. We cannot doubt that in both cases we are faced with the same psychical process, which we may recognize from its identical results. Such a far-reaching analogy between the technique of jokes and the dream-work will undoubtedly increase our interest in the former and raise an expectation in us that a comparison between jokes and dreams may help to throw light on jokes. But we will refrain from entering upon this task, for we must reflect that so far we have investigated the technique of only a very small number of jokes, so that we cannot tell whether the analogy by which we are proposing to be guided will, in fact, hold good. We will therefore turn away from the comparison with dreams and go back to the technique of jokes, though at this point we shall, as it were, be leaving a loose end to our enquiry, which at some later stage we may perhaps pick up once more.

[3]

The first thing that we want to learn is whether the process of condensation with substitute formation is to be discovered in every joke, and can therefore be regarded as a universal characteristic of the technique of jokes.

Here I recall a joke which has remained in my memory owing to the special circumstances in which I heard it. One of the great teachers of

1 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 260 f.]

2 Ibid., **4**, 266 ff.

my young days, whom we thought incapable of appreciating a joke and from whom we had never heard a joke of his own, came into the Institute one day laughing, and, more readily than usual, explained to us what it was that had caused his cheerful mood. 'I have just read an excellent joke', he said. 'A young man was introduced into a Paris salon, who was [30]
a relative of the great Jean-Jacques Rousseau and bore his name. Moreover, he was red-haired. But he behaved so awkwardly that the hostess remarked critically to the gentleman who had introduced him: "Vous m'avez fait connaître un jeune homme *roux* et *sot*, mais non pas un *Rousseau*."'[1] And he laughed again.

By the nomenclature of the authorities this would be classed as a '*Klangwitz*',[2] and one of an inferior sort, with a play upon a proper name – not unlike the joke, for instance, in the Capuchin monk's sermon in *Wallensteins Lager*, which, as is well known, is modelled on the style of Abraham a Santa Clara:

> Lässt sich nennen den *Wallenstein*,
> ja freilich ist er uns *allen* ein *Stein*
> des Anstosses und Ärgernisses.[3]

But what is the technique of this joke? We see at once that the characteristic that we may have hoped to be able to prove was a universal one is absent on the very first fresh occasion. There is no omission here, and scarcely an abbreviation. The lady herself says straight out in the joke almost everything that we can attribute to her thoughts. 'You had raised my expectations about a relative of Jean-Jacques Rousseau – perhaps a spiritual relative – and here he is: a red-haired silly young man, a *roux et sot*.' It is true that I have been able to make an interpolation; but this attempt at a reduction has not got rid of the joke. It remains, and is attached to the identity of sound of the words $\frac{\text{ROUSSEAU}}{\text{ROUX SOT}}$. It is thus proved that condensation with substitute formation has no share in the production of this joke.

1 ['You have made me acquainted with a young man who is *roux* (red-haired) and *sot* (silly), but not a Rousseau.' '*Roux-sot*' would be pronounced exactly like '*Rousseau*'.]

2 ['Sound joke.' A joke depending on sound. See below p. 40.]

3 [Schiller's *Wallensteins Lager*, Scene 8. Literally 'He gets himself called Wallenstein, and indeed he is for *allen* (all) of us a *Stein* (stone) of offence and trouble.' – Abraham a Santa Clara was a celebrated Austrian popular preacher and satirist (1644–1709).] – Nevertheless, as a result of another factor, this joke [the Rousseau joke] deserves to be more highly thought of. But this can only be indicated later on [p. 66 below].

[31] What besides? Fresh attempts at reduction can teach me that the joke remains resistant until the name 'Rousseau' is replaced with another. If, for instance, I put 'Racine' instead of it, the lady's criticism, which remains just as possible as before, loses every trace of being a joke. I now know where I have to look for the technique of this joke, though I may still hesitate over formulating it. I will try this: the technique of the joke lies in the fact that one and the same word – the name – appears in it *used in two ways*, once as a whole, and again cut up into its separate syllables like a charade.

I can bring up a few examples which have an identical technique.

An Italian lady[1] is said to have revenged herself for a tactless remark of the first Napoleon's with a joke having this same technique of the double use of a word. At a court ball, he said to her, pointing to her fellow countrymen: 'Tutti gli Italiani danzano si male.' To which she made the quick repartee: 'Non tutti, ma buona parte.'[2] (Brill, 1911.)

Once when the *Antigone* [of Sophocles] was produced in Berlin, the critics complained that the production was lacking in the proper character of antiquity. Berlin wit made the criticism its own in the following words: '*Antik? Oh, nee.*'[3] (Vischer [1846–57, **1**, 429], and Fischer, 1889, [75].)

An analogous dividing-up joke is at home in medical circles. If one enquires from a youthful patient whether he has ever had anything to do with masturbation, the answer is sure to be: '*O na, nie!*'[4]

In all three[5] of these examples, which should suffice for this species, we see the same joke technique: in each of them a name is used twice, once as a whole and again divided up into its separate syllables, which, when they are thus separated, give another sense.[6]

1 [This example was added in 1912.]

2 ['All Italians dance so badly!' 'Not all, but *buona parte* (a good part)' – the original, Italian version of Napoleon's surname.]

3 ['Antique? Oh, no.' The words, in Berlin dialect, approximate in pronunciation to 'Antigone'.]

4 ['Oh, no, never!' '*Onanie* (onanism)' is the common German word for 'masturbation'.]

5 [This should by rights have been changed to 'four' in 1912, but was left unaltered.]

6 The goodness of these jokes depends on the fact that another technical method of a far higher order is simultaneously brought into use (see below [p. 66]). – At this point I may also draw attention to a connection between jokes and riddles. The philosopher Brentano composed a kind of riddle in which a small number of syllables had to be guessed which when they were put together into words gave a different sense according as they were grouped in one way or another. For instance: '. . . liess mich das Platanenblatt ahnen' ['the plane-tree leaf (*Platanenblatt*) led me to think (*ahnen*)', where '*Platanen*' and '*blatt ahnen*' sound almost the same]. Or: 'wie du dem Inder hast verschrieben, in der Hast verschrieben' ['when you wrote a prescription for the Indian, in your haste you made a slip of the pen', where '*Inder hast* (have to the Indian)' and '*in der Hast* (in your haste)' sound the same. An English parallel may perhaps make the point clearer: 'he said he would solicit her solicitor.']

The syllables to be guessed were inserted into the appropriate place in the sentence under the disguise of the repeated sound 'dal'. [Thus the English example would be stated: 'he said he would daldaldaldal daldaldaldal.'] A colleague of the philosopher's took a witty revenge on him when he heard of the elderly man's engagement. He asked: 'Daldaldal daldaldal?' – 'Brentano brennt-a-no?' ['Brentano – does he still burn?']

Franz Brentano in 1898

Franz Brentano in 1898

Brentano is known mainly for his work in the philosophy of mind, especially for having introduced the notion of intentionality ('aboutness') to contemporary philosophy. Freud attended his lectures at the University of Vienna. Although he cites Brentano here only with reference to the 'daldal' riddles, his influence upon Freud was far-reaching.

Franz Brentano Archive, Graz.

The multiple use of the same word, once as a whole and again in the syllables into which it falls, is the first instance we have come across of a technique differing from that of condensation. But the profusion of examples that have met us must convince us after a little reflection that the newly discovered technique can scarcely be limited to this one method. There are a number of possible ways – how many it is as yet quite impossible to guess – in which the same word or the same verbal material can be put to multiple uses in one sentence. Are all these possibilities to be regarded as technical methods of making jokes? It seems to be so. And the examples of jokes which follow will prove it. [32]

In the first place, one can take the same verbal material and merely make some alteration in its *arrangement*. The slighter the alteration – the more one has the impression of something different being said in the same words – the better is the joke technically. [33]

'Mr and Mrs X live in fairly grand style. Some people think that the husband has earned a lot and so has been able to lay by a bit [*sich etwas zurückgelegt*]; others again think that the wife has lain back a bit [*sich etwas zurückgelegt*] and so has been able to earn a lot.'[1]

A really diabolically ingenious joke! And achieved with such an economy of means! 'Earned a lot – lay by a bit [*viel verdient – sich etwas zurückgelegt*]; lain back a bit – earned a lot [*sich etwas zurückgelegt – viel verdient*].' It is merely the inversion of these two phrases that distinguishes what is said about the husband from what is hinted about the wife. Here again, by the way, this is not the whole technique of the joke. [See below, pp. 36 and 66.][2]

A wide field of play lies open to the technique of jokes if we extend the 'multiple use of the same material' to cover cases in which the word (or words) in which the joke resides may occur once unaltered but the second time with a slight modification. Here, for instance, is another of Herr N.'s jokes:

What is the difference between these daldal riddles and the jokes in the text above? In the former the technique is given as a precondition and the wording has to be guessed; while in the jokes the wording is given and the technique is disguised.

[The Brentano in question was Franz Brentano (1838–1917) whose lectures on philosophy Freud had attended during his first year as a student at the University of Vienna. A fuller explanation of these riddles is given below in an Appendix, p. 206. See also Editors' Preface, p. 5 above.]

1 Daniel Spitzer, 1912 [I, 280]. [Spitzer, Viennese journalist, 1835–93.]

2 [*Footnote added* 1912:] This is also true of the excellent joke reported by Brill [1911, in English] from Oliver Wendell Holmes: 'Put not your trust in money, but put your money in trust.' Here there is promise of an antithesis but it does not materialize. The second part of the sentence cancels the antithesis. Incidentally, this is a good instance of the untranslatability of jokes with this technique.

He heard a gentleman who was himself born a Jew make a spiteful remark about the Jewish character. 'Herr Hofrat', he said, 'your ant*e*semitism was well known to me; your ant*i*semitism is new to me.'

Here only a single letter is altered, whose modification could scarcely be noticed in careless speech. The example reminds us of Herr N.'s other modification jokes (on p. 22 ff.),[1] but the difference is that here there is no condensation; everything that has to be said is said in the joke itself: 'I know that earlier you were yourself a Jew; so I am surprised that *you* should speak ill of Jews.'

[34] An admirable example of a modification joke of this kind is the well-known cry: '*Traduttore – Traditore!*'[2] The similarity, amounting almost to identity, of the two words represents most impressively the necessity which forces a translator into crimes against his original [*seinem Autor*].[3]

The variety of possible slight modifications in such jokes is so great that none of them exactly resembles another.

Here is a joke that is said to have been made during an examination in jurisprudence. The candidate had to translate a passage in the Corpus Juris: '"Labeo ait" . . . I fall, says he.' 'You fail, say I', replied the examiner, and the examination was at an end.[4] Anyone who mistakes the name of the great jurist for a verbal form, and moreover one wrongly recalled, no doubt deserves nothing better. But the technique of the joke lies in the fact that almost the same words which proved the ignorance of the candidate were used to pronounce his punishment by the examiner. The joke is, moreover, an example of 'ready repartee', the technique of which, as we shall see [p. 60 below], does not differ greatly from what we are illustrating here.

Words are a plastic material with which one can do all kinds of things. There are words which, when used in certain connections, have lost their original full meaning, but which regain it in other connections. A joke of Lichtenberg's carefully singles out circumstances in which the watered-down words are bound to regain their full meaning:

'"How are you getting along?"[5] the blind man asked the lame man. "As you see", the lame man replied to the blind man.'

1 [The page reference is given wrongly in all the German editions except the first.]

2 ['Translator – traitor!']

3 [*Footnote added* 1912:] Brill [1911] quotes a quite analogous modification joke: *Amantes amentes* (lovers are fools).

4 [This is neater in German, since exactly the same word '*fallen*' is used for both 'to fall' and 'to fail in an examination'. Labeo is, in fact, the name of a famous Roman jurist (*c.* 50 B.C.–A.D. 18), and the Latin words should really have been translated 'Labeo says'. The candidate took '*labeo*' for '*labeor*', a Latin word which does mean 'I fall'.]

5 ['*Wie geht's?*' Literally 'how do you walk?']

There are, too, words in German that can be taken, according as they are 'full' or 'empty', in a different sense, and, indeed, in more than one. For there can be two different derivatives from the same stem, one of which has developed into a word with a full meaning and the other into a watered-down final syllable or suffix, both of which, however, are [35] pronounced exactly the same. The identity of sound between a full word and a watered-down syllable may also be a chance one. In both cases the joke technique can take advantage of the conditions thus prevailing in the linguistic material.

A joke, for instance, which is attributed to Schleiermacher, is of importance to us as being an almost pure example of these technical methods:[1] '*Eifersucht* [jealousy] is a *Leidenschaft* [passion] which *mit Eifer sucht* [with eagerness seeks] what *Leiden schafft* [causes pain].'

This is undeniably in the nature of a joke, though not particularly effective as one. A quantity of factors are absent here which might mislead us in analysing other jokes so long as we examined each of those factors separately. The thought expressed in the wording is worthless; the definition it gives of jealousy is in any case thoroughly unsatisfactory. There is not a trace of 'sense in nonsense', of 'hidden meaning' or of 'bewilderment and illumination'. No efforts will reveal a 'contrast of ideas': a contrast between the words and what they mean can be found only with great difficulty. There is no sign of abbreviation; on the contrary, the wording gives an impression of prolixity. And yet it is a joke, and even a very perfect one. At the same time, its only striking characteristic is the one in the absence of which the joke disappears: the fact that here the same words are put to multiple uses. We can then choose whether to include this joke in the subclass of those in which words are used first as a whole and then divided up (e.g. Rousseau or Antigone) or in the other subclass in which the multiplicity is produced by the full or the watered-down meaning of the verbal constituents. Apart from this, only one other factor deserves notice from the point of view of the technique of jokes. We find here an unusual state of things established: a kind of 'unification' has taken place, since '*Eifersucht*' [jealousy] is defined by means of its own name – by means of itself, as it were. This, as we shall see [p. 58 ff. below], is also a technique of jokes. These two factors, therefore, must in themselves be sufficient to give a remark the character of a joke.

If now we enter still further into the variety of forms of the 'multiple [36] use' of the same word, we suddenly notice that we have before us examples of 'double meaning' or 'play upon words' – forms which have

1 [Jokes of this type are necessarily more than usually untranslatable.]

long been generally known and recognized as a technique of jokes. Why have we taken the trouble to discover afresh what we might have gathered from the most superficial essay on jokes? To begin with, we can only plead in our own justification that we have nevertheless brought out another aspect of the same phenomenon of linguistic expression. What is supposed by the authorities to show the character of jokes as a kind of 'play' has been classified by us under the heading of 'multiple use'.

The further cases of multiple use, which can also be brought together under the title of 'double meaning' as a new, third group, can easily be divided into subclasses, which, it is true, cannot be separated from one another by essential distinctions any more than can the third group as a whole from the second. We find:

(*a*) Cases of the double meaning of a *name* and of a *thing* denoted by it. For instance: 'Discharge thyself of our company, Pistol!' (Shakespeare [*Henry IV*, *Part II*, Act II, Scene 4].)

'More *Hof* [courting] than *Freiung* [marriage]' said a witty Viennese about a number of pretty girls who had been admired for many years but had never found a husband. 'Hof' and 'Freiung' are the names of two neighbouring squares in the centre of Vienna.

'Vile Macbeth does not rule here in Hamburg: the ruler here is *Banko* [bank money].' (Heine [*Schnabelewopski*, Chap. III].)

Where the name cannot be used (we should perhaps say 'misused') unaltered, a double meaning can be got out of it by one of the slight modifications we are familiar with:

'Why', it was asked, in times that are now past, 'have the French rejected *Lohengrin*?' 'On Elsa's (Elsass [Alsace]) account.'

(*b*) Double meaning arising from the *literal* and *metaphorical* meanings of a word. This is one of the most fertile sources for the technique of jokes. I will quote only one example:

A medical friend well known for his jokes once said to Arthur Schnitzler the dramatist:[1] 'I'm not surprised that you've become a great writer. After all your father held a mirror up to his contemporaries.' The mirror
[37] which was handled by the dramatist's father, the famous Dr Schnitzler, was the laryngoscope.[2] A well-known remark of Hamlet's tells us that the purpose of a play, and so also of the dramatist who creates it, is 'to hold, as 'twere, the mirror up to nature; to show virtue her own feature, scorn

1 [Who was himself a doctor of medicine.]

2 [The German word is '*Kehlkopfspiegel*', literally 'larynx mirror'. Johann Schnitzler (1835–93) was world famous for his pioneering work in laryngology.]

her own image, and the very age and body of the time his form and pressure.' (Act III, Scene 2.)

(*c*) Double meaning proper, or play upon words. This may be described as the ideal case of 'multiple use'. Here no violence is done to the word; it is not cut up into its separate syllables, it does not need to be subjected to any modification, it does not have to be transferred from the sphere it belongs to (the sphere of proper names, for instance) to another one. Exactly as it is and as it stands in the sentence, it is able, thanks to certain favourable circumstances, to express two different meanings.

Examples of this are at our disposal in plenty:

One of Napoleon III's first acts when he assumed power was to seize the property of the House of Orleans. This excellent play upon words was current at the time: 'C'est le premier vol de l'aigle.' ['It is the eagle's first *vol*.'] '*Vol*' means 'flight' but also 'theft'. (Quoted by Fischer, 1889, [80].)

Louis XV wanted to test the wit of one of his courtiers, of whose talent he had been told. At the first opportunity he commanded the gentleman to make a joke of which he, the king, should be the '*sujet* [subject]'. The courtier at once made the clever reply: 'Le roi n'est pas sujet.' ['The King is not a subject.' Also in Fischer, loc. cit.]

A doctor, as he came away from a lady's bedside, said to her husband with a shake of his head: 'I don't like her looks.' 'I've not liked her looks for a long time', the husband hastened to agree.

The doctor was of course referring to the lady's condition; but he expressed his anxiety about the patient in words which the husband could interpret as a confirmation of his own marital aversion.

Heine said of a satirical comedy: 'This satire would not have been so biting if its author had had more to bite.' This joke is more an example of metaphorical and literal double meaning than of a play upon words proper. But what is to be gained by drawing a sharp distinction here?

Another good example of play upon words is told by the authorities [38]
(Heymans and Lipps) in a form which makes it unintelligible.[1] Not long ago I came upon the correct version and setting of the anecdote in a collection of jokes which has not proved of much use apart from this.[2]

'One day Saphir and Rothschild met each other. After they had chatted for a little while, Saphir said: "Listen, Rothschild, my funds have got low, you might lend me a hundred ducats." "Oh well!" said Rothschild, "that'll suit me all right – but only on condition that you make a joke."

1 [In the original this unsatisfactory form of the anecdote is inserted by Freud as a footnote at this point. It will, we believe, be easier for English readers if this footnote is transferred to the *end* of the correct version of the story as told by Freud in the text.]

2 Hermann (1904).

"That'll suit me all right too", replied Saphir. "Good. Then come to my office tomorrow." Saphir appeared punctually. "Ah!" said Rothschild, when he saw him come in, "*Sie kommen um Ihre 100 Dukaten* [You've come about your hundred ducats]." "No", answered Saphir, "*Sie kommen um Ihre 100 Dukaten* [You're going to lose your hundred ducats] because I shan't dream of paying you back before the Day of Judgement.""[1]

[39] 'What do these statues *vorstellen* [represent or put forward]?' asked a stranger to Berlin of a native Berliner, looking at a row of monuments in a public square. 'Oh, well,' was the reply, 'either their right leg or their left leg.'[2]

'At this moment I cannot recall all the students' names, and of the professors there are some who still have no name at all.' (Heine, *Harzreise*.)

We shall be giving ourselves practice, perhaps, in diagnostic differentiation if at this point we insert another well-known joke about professors. 'The distinction between Professors Ordinary [*ordentlich*] and Professors Extraordinary [*ausserordentlich*][3] is that the ordinary ones do nothing extraordinary and the extraordinary ones do nothing properly [*ordentlich*].' This, of course, is a play on the two meanings of the words '*ordentlich*' and '*ausserordentlich*': viz. on the one hand 'inside' and 'outside' the '*ordo*' (the Establishment) and on the other hand 'efficient' and 'outstanding'. But the conformity between this joke and some others we have already met reminds us that here the 'multiple use' is far more noticeable than the 'double meaning'. All through the

1 ['*Sie kommen um* . . .' may mean equally 'You are coming about' or 'You are losing'.] – "'Saphir", so Heymans tells us, "was asked by a rich creditor whom he had come to visit: '*Sie kommen wohl um die 300 Gulden?* [No doubt you've come about the 300 florins?]' and he replied: '*Nein, Sie kommen um die 300 Gulden* [No, you're going to lose the 300 florins].' In giving this answer he was expressing his meaning in a perfectly correct and by no means unusual form." That is in fact the case. Saphir's answer, *considered in itself*, is in perfect order. We understand, too, what he means to say – namely that he has no intention of paying his debt. But Saphir makes use of the same words that had previously been used by his creditor. We therefore cannot avoid also taking them in the sense in which they had been used by the latter. And in that case Saphir's answer no longer has any meaning whatever. The creditor is not "coming" at all. Nor can he be coming "about the 300 florins" – that is, he cannot be coming to bring 300 florins. Moreover, as a creditor, it is not his business to bring but to demand. Since Saphir's words are in this way recognized as being at once sense and nonsense, a comic situation arises.' (Lipps, 1898, 97.)

The version which I have given in full in the text above for the sake of clarity shows that the technique of the joke is far simpler than Lipps supposes. Saphir does not come to *bring* the 300 florins but to *fetch* them from the rich man. Accordingly, the discussions of 'sense and nonsense' in this joke become irrelevant.

2 This play upon words is further discussed below. [There is no trace of any such further discussion, and it seems probable that this footnote should be attached at the end of the preceding paragraph, as the Saphir–Rothschild joke is in fact discussed again, on p. 38 below.]

3 [I.e. full professors and assistant professors.]

sentence we hear nothing but a constantly recurring '*ordentlich*', sometimes in that form and sometimes modified in a negative sense. (Cf. p. 29 f.) Moreover, the feat is again achieved here of defining a concept by means of its own wording (cf. the example of '*Eifersucht*' [jealousy], p. 31), or, more precisely, of defining (even if only negatively) two correlative concepts by means of one another, which produces an ingenious interlacement. Finally, the aspect of 'unification' can also be stressed here – the eliciting of a more intimate connection between the elements of the statement than one would have had a right to expect from their nature.

'The beadle[1] Sch[äfer] greeted me quite as a colleague, for he too is a writer, and has often mentioned me in his half-yearly writings; and apart [40] from that, he has often *cited*[2] me, and if he did not find me at home he was always kind enough to write the *citation* in chalk on my study door.' (Heine, *Harzreise*.)

Daniel Spitzer [p. 29 *n*. 1], in his *Wiener Spaziergänge*, produced a laconic biographical description, which is certainly also a good joke, of a social type which flourished at the time of the outbreak of speculation [following the Franco-Prussian War]: 'Iron front[3] – iron cashbox – Iron Crown.' (This last was an order which carried noble rank with it.) A striking example of 'unification' – everything, as it were, made of iron! The various, but not very markedly contrasting, meanings of the epithet 'iron' make these 'multiple uses' possible.

Another example of a play upon words may make the transition to a fresh subspecies of the technique of double meaning easier. The joking medical colleague already mentioned above (on p. 32) was responsible for this joke at the time of the Dreyfus case: 'This girl reminds me of Dreyfus. The army doesn't believe in her innocence.'

The word 'innocence', on the double meaning of which the joke is constructed, has in the one context its usual meaning, with 'fault' or 'crime' as its opposite; but in the other context it has a *sexual* meaning, of which the opposite is 'sexual experience'. Now there are a very large number of similar examples of double meaning, in all of which the effect of the joke depends quite specially on the sexual meaning. For this group we may reserve the name of '*double entendre*' [*Zweideutigkeit*].

1 [A university officer (at Göttingen) in charge of undergraduate discipline.]

2 [For breaches of discipline.]

3 [I.e. of a 'hard-faced' businessman.]

An excellent example of a *double entendre* of this kind is Spitzer's joke which has already been recorded on p. 29: 'Some people think that the husband has earned a lot and so has been able to lay by a bit [*sich etwas zurückgelegt*]; others again think that the wife has lain back a bit [*sich etwas zurückgelegt*] and so has been able to earn a lot.'

But if we compare this example of double meaning accompanied by *double entendre* with other examples, a distinction becomes evident which is not without its interest from the point of view of technique. In the 'innocence' joke, the one meaning of the word was just as obvious as the other; it would really be hard to decide whether its sexual or
[41] nonsexual meaning was the more usual and familiar. But it is otherwise with Spitzer's example. In this the commonplace meaning of the words '*sich etwas zurückgelegt*' is by far the more prominent, whereas their sexual meaning is, as it were, covered and hidden and might even escape the notice of an unsuspecting person altogether. By way of a sharp contrast let us take another example of double meaning, in which no attempt is made at thus concealing the sexual meaning: for instance, Heine's description of the character of a complaisant lady: 'She could *abschlagen*[1] nothing except her own water.' This sounds like a piece of obscenity and hardly gives the impression of a joke.[2] This peculiarity, however, where in a case of double meaning the two meanings are not equally obvious, can also occur in jokes with no sexual reference – whether because one meaning is more usual than the other or because it is brought to the front by a connection with the other parts of the sentence. (Cf., for instance, 'C'est le premier vol de l'aigle' [p. 33 above].) I propose to describe all these as 'double meaning with an allusion'.

[4]

We have already made the acquaintance of such a large number of different joke techniques that I fear there is some danger of losing our grasp of them. Let us therefore try to summarize them:

1. Condensation:

   (*a*) with formation of composite word,
   (*b*) with modification.

1 ['To refuse'; vulgarly 'to urinate'.]

2 Cf. on this Fischer (1889, 86). He gives the name of '*Zweideutigkeit*', which I have applied differently in the text, to jokes with a double meaning in which the two meanings are not equally prominent but in which one lies behind the other. Nomenclature of this kind is a matter of convention; linguistic usage has arrived at no firm decision.

II. Multiple use of the same material:

(*c*) as a whole and in parts,
(*d*) in a different order,
(*e*) with slight modification,
(*f*) of the same words full and empty.

III. Double meaning: [42]

(*g*) meaning as a name and as a thing,
(*h*) metaphorical and literal meanings,
(*i*) double meaning proper (play upon words),
(*j*) *double entendre*,
(*k*) double meaning with an allusion.

This variety and number of techniques has a confusing effect. It might make us feel annoyed at having devoted ourselves to a consideration of the technical methods of jokes, and might make us suspect that after all we have exaggerated their importance as a means for discovering the essential nature of jokes. If only this convenient suspicion were not contradicted by the one incontestable fact that the joke invariably disappears as soon as we eliminate the operation of these techniques from its form of expression! So, in spite of everything, we are led to look for the unity in this multiplicity. It ought to be possible to bring all these techniques under a single heading. As we have already said [p. 31 f. above], it is not difficult to unite the second and third groups. Double meaning (play upon words) is indeed only the ideal case of the multiple use of the same material. Of these the latter is evidently the more inclusive concept. The examples of dividing up, of rearrangement of the same material and of multiple use with slight modification (*c*, *d* and *e*) might – though only with some difficulty – be brought under the concept of double meaning. But what is there in common between the technique of the first group (condensation with substitute formation) and that of the two others (multiple use of the same material)?

Well, something very simple and obvious, I should have thought. The multiple use of the same material is, after all, only a special case of condensation; play upon words is nothing other than a condensation *without* substitute formation; condensation remains the wider category. All these techniques are dominated by a tendency to compression, or rather to saving. It all seems to be a question of economy. In Hamlet's words: 'Thrift, thrift, Horatio!'

Let us test this economy on the different examples. 'C'est le premier vol de l'aigle [p. 33 above].' It is the eagle's first flight. Yes, but it is a thieving
[43] flight. Luckily for the existence of this joke, '*vol*' means not only 'flight' but 'theft' as well. Has no condensation and economy been made? Most certainly. There has been a saving of the whole of the second thought and it has been dropped without leaving a substitute. The double meaning of the word '*vol*' has made such a substitute unnecessary; or it would be equally true to say that the word '*vol*' contains the substitute for the suppressed thought without any addition or change having to be made to the first one. That is the advantage of a double meaning.

Another example: 'Iron front – iron cashbox – Iron Crown' [p. 35 above]. What an extraordinary saving compared with an expression of the same thought in which 'iron' finds no place: 'With the help of the necessary boldness and lack of conscience it is not difficult to amass a large fortune, and for such services a title will of course be a suitable reward.'

Condensation, and therefore economy, is indeed quite unmistakably present in these examples. But it should be present in *every* example. Where is the economy hidden in such jokes as 'Rousseau – *roux et sot*' [p. 27] or 'Antigone – *Antik? Oh, nee*' [p. 28], in which we first noticed the absence of condensation and which were our principal motive for putting forward the technique of the repeated use of the same material? It is true that here we should not find that condensation would meet the case; but if instead of it we take the more inclusive concept of economy, we can manage without difficulty. It is easy to point out what we save in the case of Rousseau, Antigone, etc. We save having to express a criticism or give shape to a judgement; both are already there in the name itself. In the example of '*Leidenschaft – Eifersucht*' [passion – jealousy] [p. 31] we save ourselves the trouble of laboriously constructing a definition: '*Eifersucht*, *Leidenschaft*' – '*Eifer sucht*' ['eagerness seeks'], '*Leiden schafft*' ['causes pain']. We have only to add the linking words and there we have our definition ready made. The case is similar in all the other examples that have so far been analysed. Where there is least saving, as in Saphir's play upon words '*Sie kommen um Ihre 100 Dukaten*' [p. 34], there is at any rate a saving of the necessity for framing a new wording for the reply; the wording of the question is sufficient for the answer. The saving is not much, but in it the joke lies. The multiple use of the same words for ques-
[44] tion and answer is certainly an 'economy'. Like Hamlet's view of the rapid sequence of his father's death and his mother's marriage:

> The funeral baked-meats
> Did coldly furnish forth the marriage tables. [Act I, Scene 2.]

But before we accept the 'tendency to economy' as the most general characteristic of the technique of jokes and ask such questions as where it comes from, what it signifies and how the joke's yield of pleasure arises from it, we must find space for a doubt which has a right to be heard. It may be that every joke technique shows the tendency to save something in expression; but the relation is not reversible. Not every economy of expression, not every abbreviation, is on that account a joke as well. We reached this point once before, when we were still hoping to find the process of condensation in every joke, and raised the justifiable objection that a laconic remark is not enough to constitute a joke [p. 25 above]. There must therefore be some peculiar kind of abbreviation and economy on which the characteristic of being a joke depends; and until we know the nature of that peculiarity our discovery of the common element in the techniques of jokes brings us no nearer to a solution to our problem. And let us, further, have the courage to admit that the economies made by the joke technique do not greatly impress us. They may remind us, perhaps, of the way in which some housewives economize when they spend time and money on a journey to a distant market because vegetables are to be had there a few farthings cheaper. What does a joke save by its technique? The putting together of a few new words, which would mostly have emerged without any trouble. Instead of that, it has to take the trouble to search out the one word which covers the two thoughts. Indeed, it must often first transform one of the thoughts into an unusual form which will provide a basis for its combination with the second thought. Would it not have been simpler, easier and, in fact, more economical to have expressed the two thoughts as they happened to come, even if this involved no common form of expression? Is not the economy in words uttered more than balanced by the expenditure on intellectual effort? And who saves by that? Who gains by it?

We can evade these doubts provisionally if we transpose them to another place. Have we really already discovered all the kinds of joke technique? It will certainly be more prudent to collect fresh examples and subject them to analysis. [45]

[5]

We have in fact not yet considered a large – perhaps the most numerous – group of jokes, influenced, perhaps, by the contempt with which they are regarded. They are the kind which are generally known as '*Kalauer*'

('*calembourgs*') ['puns'][1] and which pass as the lowest form of verbal joke, probably because they are the 'cheapest' – can be made with the least trouble. And they do in fact make the least demand on the technique of expression, just as the play upon words proper makes the highest. While in the latter the two meanings should find their expression in identically the same word, which on that account is usually said only once, it is enough for a pun if the two words expressing the two meanings recall each other by some vague similarity, whether they have a general similarity of structure or a rhyming assonance, or whether they share the same first few letters, and so on. A quantity of examples like this of what are not very appropriately described as '*Klangwitze*' [sound jokes] occur in the Capuchin monk's sermon in *Wallensteins Lager*:[2]

> Kümmert sich mehr um den *Krug* als den *Krieg*,
> Wetzt lieber den *Schnabel* als den *Sabel*
> . . . . . .
> Frisst den *Ochsen* lieber als den *Oxenstirn*',
> . . . . . .
> Der *Rheinstrom* ist worden zu einem *Peinstrom*,
> Die *Klöster* sind ausgenommene *Nester*,
> Die *Bistümer* sind verwandelt in *Wüsttümer*.
> . . . . . .
> Und alle die gesegneten deutschen *Länder*
> Sind verkehrt worden in *Elender*.[3]

[46] Jokes are particularly apt to change one of the vowels in a word. Thus Hevesi (1888, 87) writes of an anti-imperial Italian poet who was nevertheless obliged later to eulogize a German emperor in hexameters: 'Since he could not exterminate the *Cäsaren* [Caesars], he at least eliminated the *Cäsuren* [caesuras].'

1 [The German '*Kalauer*' is here throughout translated by 'pun', though as will be seen Freud uses the word in a much wider sense than the English will bear.]

2 [One of these has already been quoted on p. 27 above.]

3 [Literally:

> He cares more for the *bottle* than the *battle*,
> Would rather whet his *nose* than his *sword*
> . . . . . .
> Would rather eat *oxen* than *Oxenstirn*', [the General]
> . . . . . .
> The *Rhine stream* has become a *pain stream*,
> The *monasteries* are robbed *birds' nests*,
> The *bishoprics* are transformed into *desertrics*.
> . . . . . .
> And all the blessed German *lands*
> Have been turned into *wretched places*.]

Out of the profusion of puns at our disposal, it will perhaps be of special interest to bring up a really bad example, of which Heine is guilty.[1] Having for a long time represented himself to his lady as an 'Indian prince', he throws off the mask and confesses: 'Madame, I have deceived you . . . I have no more ever been in *Kalkutta* [Calcutta] than the *Kalkuttenbraten* [roast Calcutta fowl] that I ate for luncheon yesterday.' The mistake in this joke clearly lies in the fact that the two similar words in it are not merely similar but actually identical. The bird which he had eaten roast is so called because it comes, or is supposed to come, from the same Calcutta.

Fischer (1889, 78) has devoted much attention to these forms of joke, and tries to distinguish them sharply from 'play upon words'. 'A pun is a bad play upon words, since it plays upon the word not as a word but as a sound.' The play upon words, however, 'passes from the sound of the word to the word itself'. [Ibid., 79.] On the other hand, he classes such jokes as '*famillionär*', Antigone (*Antik? Oh, nee*), etc. among the 'sound jokes'. I see no necessity for following him in this. In a play upon words, in our view, the word is also only a sound image, to which one meaning or another is attached. But here, too, linguistic usage makes no sharp distinctions; and if it treats 'puns' with contempt and 'play upon words' with a certain respect, these judgements of value seem to be determined by considerations other than technical ones. It is worthwhile paying attention to the kind of jokes that are told one as 'puns'. There are some people who, when they are in high spirits, can, for considerable periods of time, answer every remark addressed to them with a pun. One of my friends, who is a model of discretion where his serious achievements in science are concerned, is apt to boast of this ability. When on one occasion he was holding the company breathless in this way and admiration was expressed for his staying power: 'Yes', he said, 'I am lying here *auf der Ka-Lauer*.'[2] And when he was finally begged to stop, he agreed to on condition that he was appointed '*Poeta Ka-laureatus*'. Both of these, however, are excellent jokes of condensation with formation of composite words. ('I am lying here *auf der Lauer* [on the look-out] for making *Kalauer* [puns].') [47]

In any case we can already gather from the disputes about the delimitation of puns and play upon words that the former will not be able to help us to discover a completely new joke technique. If, in the case of puns, we give up the claim for the use of the *same* material in

1 [*Reisebilder* II] 'Ideen', Chapter V.

2 ['*Kalauer*' = 'pun'. '*Auf der Lauer*' = 'on the look-out'.]

more than one sense, nevertheless the accent falls on rediscovering what is familiar, on the correspondence between the two words that make up the pun; and consequently puns merely form a subspecies of the group which reaches its peak in the play upon words proper.

[6]

But there really are jokes whose technique resists almost any attempt to connect it with the groups that have so far been considered.

'The story is told of Heine that he was in a Paris salon one evening conversing with the dramatist Soulié,[1] when there came into the room one of those financial kings of Paris whom people compare with Midas – and not merely on account of their wealth. He was soon surrounded by a crowd who treated him with the greatest deference. "Look there!" Soulié remarked to Heine, "Look at the way the nineteenth century is worshipping the Golden Calf!" With a glance at the object of so much
[48] admiration, Heine replied, as though by way of correction: "Oh, he must be older than that by now!"' (Fischer, 1889, 82–3.)

Where shall we look for the technique of this excellent joke? In a play upon words, thinks Fischer: 'Thus, for instance, the words "Golden Calf" can mean both Mammon and idolatry. In the one case the gold is the main thing and in the other the statue of the animal; it may also serve to characterize, in not precisely flattering terms, someone who has a great deal of money and very little sense.' (Loc. cit.) If we make the experiment of removing the expression 'Golden Calf', we certainly get rid of the joke at the same time. We make Soulié say: 'Look there! Look at the way the people are crowding round the stupid fellow simply because he's rich!' This is no longer a joke and Heine's reply is also made impossible.

But we must recall that what we are concerned with is not Soulié's simile – which is a possible joke – but Heine's reply, which is certainly a much better one. That being so, we have no right to touch the phrase about the Golden Calf: it remains as the precondition of Heine's *mot* and our reduction must be directed only to the latter. If we expand the words 'Oh, he must be older than that by now!' we can only replace them with something like: 'Oh, he's not a calf any longer; he's a full-grown ox!'[2] Thus what was necessary for Heine's joke was that he should no longer take the 'Golden Calf' in a metaphorical but in a personal sense

1 [Frédéric Soulié (1800–47), French dramatist and novelist.]

2 [See footnote 3, p. 24 above.]

and should apply it to the rich man himself. It may even be that this double meaning was already present in Soulié's remark.

But just a moment! It looks now as though this reduction has not done away with Heine's joke completely, but on the contrary has left its essence untouched. The position now is that Soulié says: 'Look there! Look at the way the nineteenth century is worshipping the Golden Calf!' and Heine replies: 'Oh, he's not a calf any longer; he's an ox already!' And in this reduced version it is still a joke. But no other reduction of Heine's *mot* is possible.

It is a pity that this fine example involves such complicated technical conditions. We can arrive at no clarification of it. So we will leave it and look for another one in which we seem to detect an internal kinship with its predecessor.

It is one of the 'bath jokes' which treat of the Galician Jews' aversion [49]
to baths. For we do not insist upon a patent of nobility from our examples. We make no enquiries about their origin but only about their efficiency – whether they are capable of making us laugh and whether they deserve our theoretical interest. And both these two requirements are best fulfilled precisely by Jewish jokes.

'Two Jews met in the neighbourhood of the bath-house. "Have you taken a bath?" asked one of them. "What?" asked the other in return, "is there one missing?"'

If one laughs at a joke really heartily, one is not in precisely the best mood for investigating its technique. Hence some difficulties arise over making one's way into these analyses. 'It was a comical misunderstanding', we are inclined to say. Yes but what is the technique of the joke? Clearly the use of the word 'take' in two meanings. For one of the speakers 'take' was the colourless auxiliary; for the other it was the verb with its sense unwatered down. Thus it is a case of the same word used 'full' and 'empty' (Group II (*f*) [p. 37 above]). If we replace the expression 'taken a bath' with the equivalent and simpler 'bathed', the joke vanishes. The reply no longer fits. Thus the joke is once again attached to the form of expression 'taken a bath'.

That is so. But nevertheless it seems as though in this case too the reduction has been applied at the wrong point. The joke lies not in the question but in the answer – the second question: 'What? is there one missing?' And this answer cannot be robbed of being a joke by any extension or modification, so long as its sense is not interfered with. We have an impression, too, that in the second Jew's reply the disregarding of the bath is more important than the misunderstanding of the word 'take'.

But here once more we cannot see our way clearly, and we will look for a third example.

It is again a Jewish joke; but this time it is only the setting that is Jewish, the core belongs to humanity in general. No doubt this example too has its unwanted complications, but fortunately they are not the same ones that have so far prevented us from seeing clearly.

'An impoverished individual borrowed 25 florins from a prosperous acquaintance, with many asseverations of his necessitous circumstances.
[50] The very same day his benefactor met him again in a restaurant with a plate of salmon mayonnaise in front of him. The benefactor reproached him: "What? You borrow money from me and then order yourself salmon mayonnaise? Is *that* what you've used my money for?" "I don't understand you", replied the object of the attack; "if I haven't any money I *can't* eat salmon mayonnaise, and if I have some money I *mustn't* eat salmon mayonnaise. Well, then, when *am* I to eat salmon mayonnaise?"'

Here at last no more trace of a double meaning is to be found. Nor can the repetition of 'salmon mayonnaise' contain the joke's technique, for it is not 'multiple use' of the same material but a real repetition of identical material called for by the subject matter of the anecdote. We may for a time be quite baffled by this analysis and may even think of taking refuge in denying that the anecdote – though it made us laugh – possesses the character of a joke.

What more is there deserving of comment in the impoverished person's reply? That it has been very markedly given the form of a logical argument. But quite unjustifiably, for the reply is in fact illogical. The man defends himself for having spent the money lent to him on a delicacy and asks, with an appearance of reason, *when* he is to eat salmon. But that is not the correct answer. His benefactor is not reproaching him with treating himself to salmon precisely on the day on which he borrowed the money; he is reminding him that in his circumstances he has no right to think of such delicacies *at all*. The impoverished *bon vivant* disregards this only possible meaning of the reproach, and answers another question as though he had misunderstood the reproach.

Can it be that the technique of this joke lies precisely in this diverting of the reply from the meaning of the reproach? If so, a similar change of standpoint, a similar shifting [*Verschiebung*][T] of the psychical emphasis, may perhaps be traceable in the two earlier examples, which we felt were akin to this one.

And, lo and behold! this suggestion is an easy success and in fact reveals the technique of those examples. Soulié pointed out to Heine that society in the nineteenth century worshipped the 'Golden Calf' just as did the Jews in the wilderness. An appropriate answer by Heine might have been 'Yes, such is human nature; thousands of years have made no change in it' or something similar by way of assent. But Heine diverted [51]
his answer from the thought suggested to him and made no reply to it at all. He made use of the double meaning of which the phrase 'Golden Calf' is capable to branch off along a sidetrack. He caught hold of one component of the phrase, 'Calf', and replied, as though the emphasis in Soulié's remark had been upon it: 'Oh, he's not a calf any longer' . . . etc.[1]

The diversion in the bath joke is even plainer. This example calls for a graphic presentation:

The first Jew asks: 'Have you taken a *bath*?' The emphasis is on the element 'bath'.

The second replies as though the question had been: 'Have you *taken* a bath?'

This shifting of the emphasis is only made possible by the wording 'taken a bath'. If it had run 'have you bathed?' no displacement would have been possible. The non-joking answer would then have been: 'Bathed? What d'you mean? I don't know what that is.' But the technique of the joke lies in the displacement of the accent from 'bath' to 'taken'.[2]

Let us go back to the 'salmon mayonnaise', since it is the most straightforward example. What is new in it deserves our attention in various directions. First, we must give a name to the technique brought to light in it. I propose to describe it as 'displacement' [*Verschiebung*], since its essence lies in the diversion of the train of thought, the displacement of the psychical emphasis on to a topic other than the opening one. Our next task is to enquire into the relation between the technique of displacement and the form of expression of the joke. Our example ('salmon mayonnaise') shows us that a displacement joke is to a high [52]

1 Heine's answer combines two joke techniques: a diversion combined with an allusion. He did not say straight out: 'He's an ox.'

2 The word 'take [*nehmen*]' is very well adapted to form a basis for play upon words owing to the variety of ways in which it can be used. I will give a plain example, as a contrast to the displacement jokes reported above: 'A well-known stock-exchange speculator and bank director was walking with a friend along the Ringstrasse [the main Vienna boulevard]. As they went past a café he remarked: "Let's go inside and take something!" His friend held him back: "But, Herr Hofrat, the place is full of people!"' [It may be pointed out that both this joke and the bath joke above lose their effectiveness in translation because in both cases the natural 'empty' word would not be 'take' in English but 'have': 'Have you had a bath?' and 'Let's have something.']

degree independent of verbal expression. It depends not on words but on the train of thought. No replacement of the words will enable us to get rid of it so long as the sense of the answer is retained. Reduction is only possible if we change the train of thought and make the gourmet reply directly to the reproach which he has evaded in the version represented in the joke. The reduced version would then run: 'I can't deny myself what tastes good to me, and it's a matter of indifference to me where I get the money from to pay for it. There you have the explanation of why I'm eating salmon mayonnaise on the very day you've lent me the money.' But that would not be a joke; it would be a piece of cynicism.

It is instructive to compare this joke with another that is very close to it in meaning:

'A man who had taken to drink supported himself by tutoring in a small town. His vice gradually became known, however, and as a result he lost most of his pupils. A friend was commissioned to urge him to mend his ways. "Look, you could get the best tutoring in the town if you would give up drinking. So do give it up!" "Who do you think you are?" was the indignant reply. "I do tutoring so that I can drink. Am I to give up drinking so that I can get tutoring?"'

This joke gives the same appearance of being logical that we saw in the 'salmon mayonnaise'; but it is not a displacement joke. The reply was a direct one. The cynicism which was concealed in the former joke is openly admitted in this one: 'Drinking is the most important thing for me.' Actually the technique of this joke is extremely scanty and cannot explain its effectiveness. It consists simply in the rearrangement of the same material or, more precisely, in the reversal of the relation of means and ends between drinking and doing or getting tutoring. As soon as my reduction ceases to emphasize this factor in its form of expression, the joke fades, for instance: 'What a senseless suggestion! The important thing for me is the drinking, not the tutoring. After all, tutoring is only a means to enable me to go on drinking.' So the joke did in fact depend on its form of expression.

In the bath joke the dependence of the joke on its wording ('Have you
[53] taken a bath?') is unmistakable, and a change in it involves the disappearance of the joke. For in this case the technique is a more complicated one – a combination of double meaning (subspecies *f*)[1] and

1 [I.e. 'use of the same word "full" and "empty"'. In the table on pp. 37–8 above, subspecies *f* is included in Group II (Multiple Use of the Same Material), not in Group III (Double Meaning). But, as is pointed out on p. 31 f., Groups II and III merge into each other.]

displacement. The wording of the question admits a double meaning, and the joke is produced by the answer disregarding the meaning intended by the questioner and catching on to the subsidiary meaning. We are accordingly in a position to find a reduction which allows the double meaning of the wording to persist and yet destroys the joke; we can do this merely by undoing the displacement:

'Have you taken a bath?' – 'What do you think I've taken? A bath? What's that?' But this is no longer a joke, but a malicious or facetious exaggeration.

A very similar part is played by the double meaning in Heine's joke about the 'Golden Calf'. It enables the answer to make a diversion from the suggested train of thought (which is effected in the 'salmon mayonnaise' joke without any such assistance from the wording). In the reduction Soulié's remark and Heine's reply would perhaps run: 'The way in which the people here are crowding round the man simply because he's rich reminds one vividly of the worship of the Golden Calf.' And Heine: 'That he should be honoured in this way because of his wealth doesn't strike me as the worst of it. In what you say you're not putting enough stress on the fact that because of his wealth people forgive him his stupidity.' In this way the double meaning would be retained but the displacement joke would be destroyed.

But at this point we must be prepared to meet an objection which will assert that these fine distinctions are seeking to tear apart what belongs together. Does not every double meaning give occasion for a displacement – for a diversion of the train of thought from one meaning to the other? And are we prepared, then, to allow 'double meaning' and 'displacement' to be set up as representatives of two quite different types of joke technique? Well, it is true that this relation between double meaning and displacement does exist, but it has nothing to do with our distinguishing the different joke techniques. In the case of double meaning a joke contains nothing other than a word capable of multiple interpretation, which allows the hearer to find the transition from one thought to another – a transition which, stretching a point, might be equated with a displacement. In the case of a displacement joke, however, the joke itself contains a train of thought in which a displacement of this kind has been accomplished. Here the displacement is part of the work which has created the joke; it is not part of the work necessary for understanding it. If this distinction is not clear to us, we have an unfailing means of bringing it tangibly before our eyes in our attempts at reduction. But there is one merit which we will not deny to this [54]

objection. It draws our attention to the necessity of not confusing the psychical processes involved in the *construction* of the joke (the 'joke-work' [*Witzarbeit*][1]) with the psychical processes involved in *taking in* the joke (the work of understanding). Our present enquiry is only concerned with the former.[2]

Are there other examples of the displacement technique? They are not easy to find. A straightforward instance is afforded by the following joke, which moreover is not characterized by the appearance of logic which was so much overstressed in our model case:

'A horse dealer was recommending a riding horse to a customer. "If you take this horse and get on it at four in the morning you'll be at Pressburg by half-past six." – "What should I be doing in Pressburg at half-past six in the morning?"'

Here the displacement leaps to the eye. The dealer obviously mentions
[55] the early hour of arriving at the provincial town simply in order to demonstrate the horse's capacity by an example. The customer disregards the animal's capacity, which he does not question, and merely enters into the data of the example that has been chosen. The reduction of this joke is accordingly easy to give.

Greater difficulties are presented by another example the technique of which is most obscure, but which can nevertheless be solved as double meaning combined with displacement. The joke describes the prevarication of a '*Schadchen*' (a Jewish marriage broker), and is thus one of a group with which we shall often be concerned.

'The *Schadchen* had assured the suitor that the girl's father was no longer living. After the betrothal it emerged that the father was still alive and was serving a prison sentence. The suitor protested to the *Schadchen*, who replied: "Well, what did I tell you? You surely don't call that living?"'

The double meaning lies in the word 'living', and the displacement consists in the *Schadchen* shifting the meaning of the word from its ordinary sense, as a contrast to 'dead', to the sense which it has in the

1 [The term here introduced serves to emphasize the resemblance between the processes concerned in producing jokes and dreams which has already been hinted at above (p. 25 f.). The whole question is fully discussed in Chapter VI below.]

2 For the latter, see later chapters of this book. – A few further words of explanation are perhaps not unnecessary here. Displacement habitually takes place between a remark and a reply which pursues the train of thought in a direction other than that in which it was started by the original remark. The justification for distinguishing displacement from double meaning is most convincingly shown by the examples in which the two are combined – where, that is, the wording of the remark admits of a double meaning which is not intended by the speaker, but which points the way for the reply to make a displacement. (See the examples [pp. 46–7 above].)

phrase 'that's not living'. In doing so he explains his former pronouncement retrospectively [*nachträglich*][T] as having had a double meaning, though any such multiple meaning was decidedly remote in this particular case. So far the technique would seem similar to that in the 'Golden Calf' joke and the bath joke. But here there is another factor to be considered which by its prominence interferes with our understanding of the technique. It might be described as a 'characterizing' joke: it seeks by an example to illustrate a marriage broker's characteristic mixture of mendacious impudence and readiness of repartee. We shall find that this is only the outer shell, the façade, of the joke; its meaning – that is to say, its purpose – is something different. And we must postpone the attempt at a reduction of it.[1]

Nachträglichkeit

After these complicated examples, which have been so hard to analyse, it will be with satisfaction that we are able to turn once more to an example which can be recognized as a perfectly straightforward and transparent sample of a displacement joke:

'A *Schnorrer* [Jewish beggar] approached a wealthy baron with a request for the grant of some assistance for his journey to Ostend. The doctors, he said, had recommended him sea-bathing to restore his health. "Very well", said the rich man, "I'll give you something towards it. But must you go precisely to Ostend, which is the most expensive of all sea-bathing resorts?" – "Herr Baron", was the reproachful reply, "I consider nothing too expensive for my health."' This is no doubt a correct point of view, but not correct for a petitioner. The answer is given from the point of view of a rich man. The *Schnorrer* behaves as though it was his own money that he was to sacrifice for his health, as though the money and the health were the concern of the same person.[2] [56]

[7]

Let us start once more from that highly instructive example 'salmon mayonnaise'. It, too, presented us with a façade, in which a striking parade of logical thinking was exhibited; and we learnt from analysing it that this logic was used to conceal a piece of faulty reasoning – namely, a displacement of the train of thought. This may serve to remind us, if only by means of a contrasting connection, of other jokes which, quite the other way, undisguisedly exhibit a piece of nonsense or stupidity. We shall be curious to learn what may be the technique of such jokes.

1 See Chapter III below [p. 92 ff.].

2 [This joke reappears on p. 99 below.]

I will begin with the most forcible and at the same time the plainest example of the whole group. Once again it is a Jewish joke:

'Itzig had been declared fit for service in the artillery. He was clearly an intelligent lad, but intractable and without any interest in the service. One of his superior officers, who was friendlily disposed to him, took him on one side and said to him: "Itzig, you're no use to us. I'll give you a piece of advice: buy yourself a cannon and make yourself independent!"'

This advice, which may raise a hearty laugh, is obvious nonsense. Cannons are not to be bought and an individual cannot make himself independent as a military unit – set himself up in business, as it were. But it is impossible to doubt for a moment that the advice is not mere nonsense but joking nonsense – an excellent joke. How then is the nonsense turned into a joke?

[57] Not much reflection is needed. We can infer from the authorities' comments indicated above in the introduction [p. 11 f.] that there is sense behind joking nonsense such as this, and that it is this sense that makes the nonsense into a joke. The sense in our example is easy to find. The officer who gives Artilleryman Itzig this nonsensical advice is only making himself out stupid to show Itzig how stupidly he himself is behaving. He is copying Itzig: 'I'll give you some advice that's as stupid as you are.' He enters into Itzig's stupidity and makes it clear to him by taking it as the basis of a suggestion which would fit in with Itzig's wishes: if Itzig possessed a cannon of his own and carried out military duties on his own account, how useful his intelligence and ambition would be to him! In what good order he would keep his cannon and how familiar he would make himself with its mechanism so as to meet the competition of the other possessors of cannons!

I will interrupt the analysis of this example, to point out the same sense in nonsense in a shorter and simpler, though less glaring, case of a nonsensical joke:

'Never to be born would be the best thing for mortal men.'[1] 'But', adds the philosophical comment in *Fliegende Blätter*,[2] 'this happens to scarcely one person in a hundred thousand.'

This modern addition to an ancient saw is an evident piece of nonsense, made sillier by the ostensibly cautious 'scarcely'. But the addition is attached to the original statement as an indisputably correct limitation, and is thus able to open our eyes to the fact that this solemnly accepted piece of wisdom is itself not much better than a piece

1 [*Contest of Homer and Hesiod*, Section 316.]

2 [A well-known comic weekly.]

of nonsense. Anyone who is not born is not a mortal man at all, and there is no good and no best for him. Thus the nonsense in the joke serves to uncover and demonstrate another piece of nonsense, just as in the example of Artilleryman Itzig.

And here I can add a third instance, which, from its content, would scarcely deserve the lengthy description that it requires, but which once again exemplifies with special clarity the use of nonsense in a joke to demonstrate another piece of nonsense.

'A man who was obliged to go on a journey confided his daughter to a friend with the request that he should watch over her virtue during his absence. Some months later he returned, and found that she was pregnant. As was natural, he reproached his friend, who, however, seemed unable to explain the misfortune. "Well", asked the father at last, "where did she sleep?" – "In the room with my son." – "But how could you let her sleep in the same room as your son after I'd begged you so to look after her?" – "After all, there was a screen between them. Your daughter's bed was on one side and my son's bed on the other, with the screen between them." – "And suppose he walked round the screen?" – "Yes, there is that", replied the other thoughtfully; "it might have happened like that."' [58]

We can arrive with the greatest ease at the reduction of this joke, whose qualities have otherwise little to recommend it. It would obviously run: 'You have no right to reproach me. How could you be so stupid as to leave your daughter in a house where she is bound to live in the constant company of a young man? How would it be possible for an outsider to answer for a girl's virtue in such circumstances?' Here, then, the friend's apparent stupidity is only a reflection of the father's stupidity. The reduction has disposed of the stupidity in the joke and at the same time of the joke itself. The element 'stupidity' itself has not been got rid of: it is to be found at another point in the context of the sentence after it has been reduced to its original meaning.

We can now attempt a reduction of the joke about the cannon. The officer should have said: 'Itzig, I know you're an intelligent man of business. But I assure you it is very stupid of you if you can't see that it is impossible to behave in the army in the same way as in business life, where each person acts for himself and against the others. In military life subordination and cooperation are the rule.'

The technique of the nonsensical jokes which we have so far considered really consists, therefore, in presenting something that is stupid and

nonsensical, the sense of which lies in the revelation and demonstration of something else that is stupid and nonsensical.

Has this use of absurdity in joke technique always the same significance? Here is one more example which gives an affirmative reply:

[59] 'When on one occasion Phocion[1] was applauded after making a speech, he turned to his friends and asked: "What have I said that's stupid, then?"'

The question sounds absurd. But we see its meaning at once: 'What have I said, then, that can have pleased these stupid people so much? I ought to feel ashamed of the applause. If what I said has pleased stupid people, it cannot itself have been very sensible.'

Other examples, however, can teach us that absurdity is very often used in joke technique without serving the purpose of demonstrating another piece of nonsense:

'A well-known university teacher, who was in the habit of peppering his unattractive special subject with numerous jokes, was congratulated on the birth of his youngest child, who was granted to him when he had already reached an advanced age. "Yes", he replied to his well-wishers, "it is remarkable what human hands can accomplish."' – This answer seems quite specially nonsensical and out of place. Children, after all, are regarded as a blessing of God, quite in contrast to human handiwork. But it soon occurs to us that after all the answer has a meaning and, at that, an obscene one. There is no question here of the happy father making himself out stupid in order to show that something or someone else is stupid. The apparently senseless answer makes a surprising, a bewildering impression on us, as the authorities would say. As we have seen [p. 12 f. above] they attribute the whole effect of jokes like this to an alternation between 'bewilderment and illumination'. We shall try later [p. 115 below] to form a judgement on this; for the moment we must be content to stress the fact that the technique of this joke lies in its presentation of something bewildering and nonsensical.

A joke of Lichtenberg's takes a quite special place among these 'stupid' jokes:

'He wondered how it is that cats have two holes cut in their skin precisely at the place where their eyes are.' To wonder about something that is in fact only the statement of an identity is undoubtedly a piece of stupidity [see below, p. 82]. It reminds one of Michelet's exclamation[2] which was meant to be taken seriously, and which to the best of my recol-

[60] lection runs: 'How beautifully Nature has arranged it that as soon as a

1 [The Athenian statesman.]

2 *La femme* [1860].

child comes into the world it finds a mother ready to take care of it!' Michelet's pronouncement is a real piece of stupidity, but Lichtenberg's is a joke which makes use of stupidity for some purpose and behind which something lies. But what? For the moment, we must admit, no answer can be given.

[8]

We have now already found from two groups of examples that the joke-work makes use of deviations from normal thinking – of displacement and absurdity – as technical methods for producing a joking form of expression. It is no doubt justifiable to expect that other kinds of faulty reasoning may find a similar use. And it is in fact possible to produce a few examples of the sort:

'A gentleman entered a pastry-cook's shop and ordered a cake; but he soon brought it back and asked for a glass of liqueur instead. He drank it and began to leave without having paid. The proprietor detained him. "What do you want?" asked the customer. – "You've not paid for the liqueur." – "But I gave you the cake in exchange for it." – "You didn't pay for that either." – "But I hadn't eaten it."'

This anecdote too has an appearance of logic about it, which, as we already know, is a suitable façade for a piece of faulty reasoning. The mistake evidently lies in the crafty customer's constructing a connection which did not exist between the giving back of the cake and the taking of the liqueur in its place. The episode in fact fell into two processes, which were independent of each other so far as the vendor was concerned and were substitutes for each other only from the point of view of the purchaser's intention. First, he took the cake and gave it back, and therefore owed nothing for it; then he took the liqueur, and for it he owed payment. We might say that the customer used the relation 'in exchange for' with a double meaning. But it would be more correct to say that by means of a double meaning he constructed a connection which was not in reality valid.[1]

This is an opportunity for making a not unimportant admission. We [61]
are engaged in investigating the technique of jokes as shown in examples; and we should therefore be certain that the examples we have chosen are really genuine jokes. It is the case, however, that in a number

1 [*Footnote added* 1912:] A similar nonsensical technique appears if a joke seeks to maintain a connection which seems to be excluded by the special conditions implied in its content. Such, for instance, is Lichtenberg's knife without a blade which has no handle. [This is further explained in a passage near the end of the 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 58.] So, too, the joke repeated by Von Falke [1897]: 'Is this the place where the Duke of Wellington spoke those words?' – 'Yes, it is the place; but he never spoke the words.' [Cf. Von Falke's *Memoirs*, p. 271.]

of instances we are in doubt whether or not the particular example ought to be called a joke. We have no criterion at our disposal before our investigation has given us one. Linguistic usage is untrustworthy and itself needs to have its justification examined. In coming to our decision we can base ourselves on nothing but a certain 'feeling', which we may interpret as meaning that the decision is made in our judgement in accordance with particular criteria that are not yet accessible to our knowledge. In the case of our last example we must feel a doubt whether it should be represented as a joke, or perhaps as a 'sophistical' joke, or simply as a piece of sophistry. For the fact is that we do not yet know in what the characteristic of being a joke resides.

On the other hand, the next example, which exhibits a type of faulty reasoning that may be said to be complementary to the former instance, is an undoubted joke. It is once again a story of a marriage broker:

'The *Schadchen* was defending the girl he had proposed against the young man's protests. "I don't care for the mother-in-law", said the latter. "She's a disagreeable, stupid person." – "But after all you're not marrying the mother-in-law. What you want is her daughter." – "Yes, but she's not young any longer, and she's not precisely a beauty." – "No matter. If she's neither young nor beautiful she'll be all the more faithful to you." – "And she hasn't much money." – "Who's talking about money? Are you marrying money then? After all, it's a wife that you want." – "But she's got a hunchback too." – "Well, what *do* you want? Isn't she to have a single fault?"'

What was really in question, then, was an unbeautiful girl, no longer
[62] young, with a scanty dowry and an unpleasant mother, who was moreover the victim of a serious deformity – not very inviting conditions for contracting a marriage. The marriage broker was able, in the case of each one of these defects, to point out how it would be possible to come to terms with it. He was then able to claim that the inexcusable hunchback was the single defect that every individual must be allowed to possess. Once more there is the appearance of logic which is characteristic of a piece of sophistry and which is intended to conceal the faulty reasoning. Clearly the girl had a number of defects – several that might be overlooked and one that it was impossible to disregard; she was unmarriageable. The broker behaved as though each separate defect was got rid of by his evasions, whereas in fact each one of them left a certain amount of depreciation behind which had to be added to the next one. He insisted on treating each defect in isolation and refused to add them up into a total.

The same omission is the core of another piece of sophistry which has been much laughed over, but whose right to be called a joke might be doubted:

'A. borrowed a copper kettle from B. and after he had returned it was sued by B. because the kettle now had a big hole in it which made it unusable. His defence was: "First, I never borrowed a kettle from B. at all; secondly, the kettle had a hole in it already when I got it from him; and thirdly, I gave him back the kettle undamaged."' Each one of these defences is valid in itself, but taken together they exclude one another. A. was treating in isolation what had to be regarded as a connected whole, just as the marriage broker treated the girl's defects. We might also say: 'A. has put an "and" where only an "either–or" is possible.'[1]

We find another piece of sophistry in the following marriage-broker story:

'The would-be bridegroom complained that the bride had one leg shorter than the other and limped. The *Schadchen* contradicted him: "You're wrong. Suppose you marry a woman with healthy, straight limbs! What do you gain from it? You never have a day's security that she won't fall down, break a leg and afterwards be lame all her life. And think of the suffering then, the agitation, and the doctor's bill! But if you take *this* [63] one, that can't happen to you. Here you have a *fait accompli*."'

The appearance of logic is very thin in this case, and no-one will be ready to prefer an already 'accomplished misfortune' to one that is merely a possibility. The fault in this train of thought can be more easily shown in another example – a story which I cannot entirely divest of its dialect:

'In the temple at Cracow the Great Rabbi N. was sitting and praying with his disciples. Suddenly he uttered a cry, and, in reply to his disciples' anxious enquiries, exclaimed: "At this very moment the Great Rabbi L. has died in Lemberg." The community put on mourning for the dead man. In the course of the next few days people arriving from Lemberg were asked how the Rabbi had died and what had been wrong with him; but they knew nothing about it, and had left him in the best of health. At last it was established with certainty that the Rabbi L. in Lemberg had not died at the moment at which the Rabbi N. had observed his death by telepathy, since he was still alive. A stranger took the opportunity of jeering at one of the Cracow Rabbi's disciples about this occurrence: "Your Rabbi made a great fool of himself that time, when he saw the Rabbi L. die in Lemberg. The man's alive to this day." "That makes no

1 [This anecdote is further discussed below on p. 178.]

difference", replied the disciple. "Whatever you may say, the *Kück*[1] from Cracow to Lemberg was a magnificent one.'"

The faulty reasoning common to the last two examples is here undisguisedly admitted. The value of phantasy is exalted unduly in comparison with reality; a possibility is almost equated with an actual event. The distant look across the stretch of country separating Cracow and Lemberg would have been an impressive telepathic achievement if it had produced something that was true. But the disciple was not concerned with that. It might after all have possibly happened that the Rabbi in Lemberg had died at the moment at which the Cracow Rabbi announced his death; and the disciple displaced the emphasis from the
[64] condition subject to which the teacher's achievement deserved admiration on to an unconditional admiration of the achievement. '*In magnis rebus voluisse sat est*'[2] expresses a similar point of view. Just as in this example reality is disregarded in favour of possibility, so in the former one the marriage broker suggests to the would-be bridegroom that the possibility of a woman being made lame by an accident should be regarded as something far more important than the question of whether or not she is really lame.

This group of 'sophistical' pieces of faulty reasoning is resembled by another interesting group in which the faulty reasoning can be described as 'automatic'. It may be due to no more than a whim of chance that all the examples that I shall bring forward of this new group are once more *Schadchen* stories:

'A *Schadchen* had brought an assistant with him to the discussion about the proposed bride, to bear out what he had to say. "She is straight as a pine-tree", said the *Schadchen*. – "As a pine-tree", repeated the echo. – "And she has eyes that ought to be seen!" – "What eyes she has!" confirmed the echo. – "And she is better educated than anyone!" – "What an education!" – "It's true there's one thing", admitted the broker, "she has a small hump." – "And *what* a hump!" the echo confirmed once more.' The other stories are analogous, but have more sense.

'The bridegroom was most disagreeably surprised when the bride was introduced to him, and drew the broker on one side and whispered his remonstrances: "Why have you brought me here?" he asked reproachfully. "She's ugly and old, she squints and has bad teeth and

1 [A Yiddish word] from the German '*gucken*' [to look or peep]: 'look', 'distant look'. – [This story is alluded to in Freud's posthumously published paper on 'Psychoanalysis and Telepathy' (1941*d* [1921]), *RSE*, **18**, 177.]

2 ['In great things it is enough to have wished.' The quotation, in a slightly different form – '*in magnis et voluisse sat est*' – is from Propertius, *Elegies*, x, 6.]

bleary eyes . . .” – “You needn’t lower your voice”, interrupted the broker, “she’s deaf as well.’”

‘The bridegroom was paying his first visit to the bride’s house in the company of the broker, and while they were waiting in the salon for the family to appear, the broker drew attention to a cupboard with glass doors in which the finest set of silver plate was exhibited. “There! Look at that! You can see from these things how rich these people are.” – “But”, asked the suspicious young man, “mightn’t it be possible that these fine things were only collected for the occasion – that they were [65] borrowed to give an impression of wealth?” – “What an idea!” answered the broker protestingly. “Who do you think would lend these people anything?”’

The same thing happens in all three cases. A person who has reacted in the same way several times in succession repeats this mode of expression on the next occasion, when it is unsuitable and defeats his own intentions. He neglects to adapt himself to the needs of the situation, by giving way to the automatic action of habit. Thus, in the first story the assistant forgets that he was brought along in order to prejudice the would-be bridegroom in favour of the proposed bride. And since to begin with he has performed his task and underlined the bride’s advantages by repeating each one as it is brought forward, he goes on to underline her timidly admitted hump, which he should have minimized. The broker in the second story is so much fascinated by the enumeration of the bride’s defects and infirmities that he completes the list out of his own knowledge, though that was certainly not his business or purpose. In the third story, finally, he allows himself to be so much carried away by his eagerness to convince the young man of the family’s wealth that, in order to establish one confirmatory point, he brings up something that is bound to upset all his efforts. In every case automatic action triumphs over the expedient modification of thought and expression.

This is easy to see; but it is bound to have a confusing effect when we notice that these three stories have as much right to be called ‘comic’ as we had to produce them as ‘jokes’. The uncovering of psychical automatism is one of the techniques of the comic, just as is any kind of revelation or self-betrayal. We suddenly find ourselves faced at this point with the problem of the relation of jokes to the comic which we intended to evade. (See the introduction [p. 9 above].) Are these stories perhaps only ‘comic’ and not ‘jokes’? Is the comic operating here by the same methods as jokes do? And, once again, what constitutes the peculiar characteristics of jokes?

We must keep to our view that the technique of this last group of jokes that we have examined lies in nothing else than in bringing forward 'faulty reasoning'. But we are obliged to admit that their examination has
[66] so far led us more into obscurity than understanding. Nevertheless we do not abandon our expectation that a more complete knowledge of the techniques of jokes will lead us to a result which can serve as a starting point for further discoveries.

[9]

The next examples of jokes, with which we shall pursue our enquiry, offer an easier task. Their technique, in particular, reminds us of what we already know.

First, here is a joke of Lichtenberg's:

'January is the month in which we offer our dear friends wishes, and the rest are the months in which they are not fulfilled.'

Since these jokes are to be described as refined rather than strong, and work by methods that are unobtrusive, we will begin by presenting a number of them in order to intensify their effect:

'Human life falls into two halves. In the first half we wish the second one would come; and in the second we wish the first one were back.'

'Experience consists in experiencing what one does not wish to experience.'

(Both these last two are from Fischer, 1889, [59–60].)

These examples cannot fail to remind us of a group with which we have already dealt and which is distinguished by the 'multiple use of the same material' [p. 29 ff. above]. The last example in particular will raise the question of why we did not include it in that group instead of introducing it here in a fresh connection. 'Experience' is once again described in its own terms, just as 'jealousy' was earlier (p. 31). I should not be inclined to dispute this classification very seriously. But as regards the other two examples (which are of a similar nature), I think another factor is more striking and more important than the multiple use of the same words, in which in this case there is nothing that fringes on double meaning. I should like in particular to stress the fact that here new and unexpected unities are set up, relations of ideas to one another, definitions made mutually or by reference to a common third element. I should like to name this process 'unification'. It is clearly analogous to
[67] condensation [*Verdichtung*] by compression into the same words. Thus the two halves of human life are described by a mutual relation

discovered to exist between them: in the first we wish the second would come and in the second we wish the first were back. Speaking more precisely, two very similar mutual relations have been chosen for representation. To the similarity of the relations there corresponds a similarity of the words, which may indeed remind us of the multiple use of the same material: 'wish . . . would come' – 'wish . . . back'. In Lichtenberg's joke January and the months contrasted with it are characterized by a (once again, modified) relation to a third element; these are the good wishes, which are received in the first month and not fulfilled in the remaining ones. Here the distinction from the multiple use of the same material (which approximates to double meaning) is very clear.[1]

1 In order to give a better description of 'unification' than the examples above allow of, I will make use of something I have already mentioned [p. 28 *n.* 6 above] – namely the peculiar negative relation that holds between jokes and riddles, according to which the one conceals what the other exhibits. Many of the riddles with the production of which G. T. Fechner, the philosopher, passed his time when he was blind are characterized by a high degree of unification, which lends them a special charm. Take, for instance, as a neat example, Riddle No. 203 (Dr Mises' [pseudonym of Fechner] *Rätselbüchlein*, 4th edition, enlarged, N.D. [1875]):

Die beiden ersten finden ihre Ruhestätte
Im Paar der andern, und das Ganze macht ihr Bette.

[My two first (*Toten*, the dead) find their resting place in my two last (*Gräber*, graves), and my whole (*Totengräber*, grave-digger) makes their bed.]

We are told nothing about the two pairs of syllables that have to be guessed except a relation that holds between them, and about the whole we are only told its relation to the first pair.

The following are two examples of description by relation to the same or a slightly modified third element:

Die erste Silb' hat Zähn' und Haare,
Die zweite Zähne in den Haaren,
Wer auf den Zähnen nicht hat Haare,
Vom Ganzen kaufe keine Waren. No. 170.

[The first syllable has teeth and hair (*Ross*, horse), the second has teeth in the hair (*Kamm*, comb). No-one who has not hair on his teeth (i.e. who is not able to look after his interests) should buy goods from the whole (*Rosskamm*, horse dealer).]

Die erste Silbe frisst,
Die andere Silbe isst,
Die dritte wird gefressen,
Das Ganze wird gegessen. No. 168.

[The first syllable gobbles (*Sau*, sow), the second syllable eats (*Er*, he), the third is gobbled (*Kraut*, weeds), the whole is eaten (*Sauerkraut*). *N.B.* In German two different but similar verbs are used for 'to eat' according to whether the process is performed by animals or human beings.]

The most perfect instance of unification is to be found in a riddle of Schleiermacher's, which cannot be denied the character of a joke:

Von der letzten umschlungen
Schwebt das vollendete Ganze
Zu den zwei ersten empor.

[Entwined by my last (*Strick*, rope), my completed whole (*Galgenstrick*, rogue) swings to the top of my two first (*Galgen*, gallows).]

The great majority of all such riddles lack unification. That is to say, the clue by which one syllable is to be guessed is quite independent of those that point to the second or third, as well as of the indication which is to lead to the separate discovery of the whole.

[68] Here is a neat example of a unification joke which needs no explanation:

'The French poet J. B. Rousseau wrote an Ode to Posterity. Voltaire was not of the opinion that the poem merited survival, and jokingly remarked: "This poem will not reach its destination."' (Fischer, 1889, [123].)

This last example draws attention to the fact that it is essentially unification that lies at the bottom of jokes that can be described as 'ready repartees'. [Cf. p. 30 above.] For repartee consists in the defence going to meet the aggression, in 'turning the tables on someone' or 'paying someone back in his own coin' – that is, in establishing an unexpected unity between attack and counterattack. For instance:

'An innkeeper had a whitlow on his finger and the baker said to him: "You must have got that by putting your finger in your beer." "It wasn't that", replied the innkeeper, "I got a piece of your bread under my nail."' (From Überhorst (1900, **2**).)

'Serenissimus[1] was making a tour through his provinces and noticed a [69] man in the crowd who bore a striking resemblance to his own exalted person. He beckoned to him and asked: "Was your mother at one time in service in the palace?" – "No, your Highness," was the reply, "but my father was."'

'Duke Charles of Württemberg happened on one of his rides to come upon a dyer who was engaged on his job. Pointing to the grey horse he was riding, the Duke called out: "Can you dye him blue?" "Yes, of course, your Highness," came the answer, "if he can stand boiling."' [Fischer, 1889, 107.]

In this excellent *tu quoque*, in which a nonsensical question is met by an equally impossible condition, there is another technical factor at work which would have been absent if the dyer had answered: 'No, your Highness. I'm afraid the horse wouldn't stand boiling.'

Unification has another, quite specially interesting technical instrument at its disposal: stringing things together with the conjunction 'and'. If things are strung together in this way it implies that they are connected: we cannot help understanding it so. For instance, when Heine, speaking of the city of Göttingen in the *Harzreise*, remarks: 'Speaking generally, the inhabitants of Göttingen are divided into students, professors, philistines and donkeys', we take this grouping in precisely the sense which Heine emphasizes in an addition to the sentence: 'and these four classes are anything but sharply divided.' Or, again, when [ibid.] he

1 [The name conventionally given to royal personages by comic periodicals under the German Empire.]

speaks of the school in which he had to put up with 'so much Latin, caning and geography', this series, which is made even more transparent by the position of the 'caning' between the two educational subjects, tells us that the unmistakable view taken by the schoolboys of the caning certainly extended to Latin and geography as well.

Among the examples given by Lipps [1898, 177] of 'joking enumeration' ('coordination'), we find the following lines quoted as being closely akin to Heine's 'students, professors, philistines and donkeys':

> Mit einer Gabel und mit Müh'
> Zog ihn die Mutter aus der Brüh.
>
> [With a fork and much to-do
> His mother dragged him from the stew.]

It is as though (Lipps comments) the *Müh* [trouble, to-do] were an instrument like the fork. We have a feeling, however, that these lines, [70] though they are very comic, are far from being a joke, while Heine's list undoubtedly is one. We may perhaps recall these examples later, when we need no longer evade the problem of the relation between the comic and jokes. [See below, p. 184.])

[10]

We observed in the example of the Duke and the dyer that it would remain a joke by unification if the dyer had replied: '*No*, I'm afraid the horse wouldn't stand boiling.' But his actual reply was: '*Yes*, your Highness, if he can stand boiling.' The replacement of the really appropriate 'no' with a 'yes' constitutes a new technical method of joking, the employment of which we will pursue in some other examples.

A joke similar to the one we have just mentioned (also quoted by Fischer [1889, 107–8]) is simpler:

'Frederick the Great heard of a preacher in Silesia who had the reputation of being in contact with spirits. He sent for the man and received him with the question "You can conjure up spirits?" The reply was: "At your Majesty's command. But they don't come."' It is quite obvious here that the method used in the joke lay in nothing else than the replacing of the only possible answer 'no' with its opposite. In order to carry out the replacement, it was necessary to add a 'but' to the 'yes'; so that 'yes' and 'but' are equivalent in sense to 'no'.

This 'representation by the opposite', as we shall call it, serves the joke-work in various forms. In the next two examples it appears almost pure:

'This lady resembles the Venus of Milo in many respects: she, too, is extraordinarily old, like her she has no teeth, and there are white patches on the yellowish surface of her body.' (Heine.)

Here we have a representation of ugliness through resemblances to what is most beautiful. It is true that these resemblances can only exist in qualities that are expressed in terms with a double meaning or in unimportant details. This latter feature applies to our second example – 'The Great Spirit', by Lichtenberg:

[71] 'He united in himself the characteristics of the greatest men. He carried his head askew like Alexander; he always had to wear a toupee like Caesar; he could drink coffee like Leibniz; and once he was properly settled in his armchair, he forgot eating and drinking like Newton, and had to be woken up like him; he wore his wig like Dr Johnson, and he always left a breeches-button undone like Cervantes.'

Von Falke (1897, 271) brought home a particularly good example of representation by the opposite from a journey to Ireland, an example in which no use whatever is made of words with a double meaning. The scene was a waxwork show (as it might be, Madame Tussaud's). A guide was conducting a company of old and young visitors from figure to figure and commenting on them: 'This is the Duke of Wellington and his horse', he explained. Whereupon a young lady asked: 'Which is the Duke of Wellington and which is his horse?' 'Just as you like, my pretty child,' was the reply. 'You pays your money and you takes your choice.'

The reduction of this Irish joke would be: 'Shameless the things these waxwork people dare to offer the public! One can't distinguish between the horse and its rider! (Facetious exaggeration.) And that's what one pays one's money for!' This indignant exclamation is then dramatized, based on a small occurrence. In place of the public in general an individual lady appears and the figure of the rider is particularized: he must be the Duke of Wellington, who is so extremely popular in Ireland. But the shamelessness of the proprietor or guide, who takes money out of people's pockets and offers them nothing in return, is represented by the opposite – by a speech in which he boasts himself a conscientious man of business, who has nothing more closely at heart than regard for the rights which the public has acquired by its payment. And now we can see that the technique of this joke is not quite a simple one. Insofar as it enables the swindler to insist on his conscientiousness it is a case of

representation by the opposite; but insofar as it effects this on an occasion on which something quite different is demanded of him – so that he replies with businesslike respectability where what we expect of him is the identification of the figures – it is an instance of displacement. The technique of the joke lies in a combination of the two methods.

No great distance separates this example from a small group which might be described as 'overstatement' jokes. In these the 'yes' which would be in place in the reduction is replaced with a 'no', which, however, on account of its content, has the force of an intensified 'yes', and *vice versa*. A denial is a substitute for an overstated confirmation. Thus, for instance, in Lessing's epigram:[1] [72]

> Die gute Galathee! Man sagt, sie schwärz' ihr Haar;
> Da doch ihr Haar schon schwarz, als sie es kaufte, war.
>
> [Good Galathea blacks her hair, 'tis thought;
> And yet her hair was black when it was bought.]

Or Lichtenberg's malicious defence of philosophy:

'There are more things in heaven and earth than are dreamt of in your philosophy', said Prince Hamlet contemptuously. Lichtenberg knew that this condemnation is not nearly severe enough, for it does not take into account all the objections that can be made to philosophy. He therefore added what was missing: 'But there is much, too, in philosophy that is not to be found in heaven or earth.' His addition, it is true, emphasizes the way in which philosophy compensates us for the insufficiency for which Hamlet censures it. But this compensation implies another and still greater reproach.

Two Jewish jokes, though they are of a coarse type, are even clearer, since they are free from any trace of displacement:

'Two Jews were discussing baths. "I have a bath every year", said one of them, "whether I need one or not."'

It is obvious that this boastful insistence on his cleanliness only serves to convict him of uncleanliness.

'A Jew noticed the remains of some food in another one's beard. "I can tell you what you had to eat yesterday." – "Well, tell me." – "Lentils, then." – "Wrong: the day before yesterday!"'

The following example is an excellent 'overstatement' joke, which can easily be traced back to representation by the opposite:

'The king condescended to visit a surgical clinic and came on the professor as he was carrying out the amputation of a leg. He accompanied

1 ['Auf die Galathee', *Sinngedichte*.] Modelled on one in the Greek Anthology.

all its stages with loud expressions of his royal satisfaction: "Bravo!
[73] bravo! my dear Professor." When the operation was finished, the professor approached him and asked him with a deep bow: "Is it your Majesty's command that I should remove the other leg too?""

The professor's thoughts during the royal applause could certainly not have been expressed unaltered: 'This makes it look as though I were taking off the poor fellow's bad leg by royal command and only for the royal satisfaction. After all, I really have other reasons for the operation.' But he then goes to the king and says: 'I have no reasons for carrying out an operation other than your Majesty's command. The applause you honoured me with has made me so happy that I only await your Majesty's orders to amputate the sound limb too.' In this way he succeeds in making himself understood by saying the opposite of what he thinks but must keep to himself. This opposite is an overstatement that cannot be believed.

As these examples show, representation by the opposite is an instrument of joke technique that is used frequently and works powerfully. But there is something else that we should not overlook: namely that this technique is by no means peculiar to jokes. When Mark Antony, after he has made a long speech in the Forum and has reversed the emotional attitude of his audience round Caesar's corpse, finally exclaims once more:

'For Brutus is an honourable man . . .'

he knows that the people will now shout back to him the true sense of his words:

'They were traitors: honourable men!'

Or when *Simplicissimus*[1] describes a collection of incredible pieces of brutality and cynicism as the expressions of 'men of feeling', this too is a representation by the opposite. But we call this 'irony' and no longer a joke. The only technique that characterizes irony is representation by the opposite. Moreover, we read and hear of 'ironical jokes'. So it can no longer be doubted that technique alone is insufficient to characterize the nature of jokes. Something further is needed which we have not yet discovered. But on the other hand it remains an uncontradicted fact that if we undo the technique of a joke it disappears. For the time being we may
[74] find difficulty in thinking how these two fixed points that we have arrived at in explaining jokes can be reconciled.

1 [The famous Munich comic weekly.]

[11]

If representation by the opposite is one of the technical methods of jokes, we can expect that jokes may also make use of its contrary – representation by something *similar* or akin. A further pursuit of our enquiry will in fact show us that this is the technique of a fresh and particularly comprehensive group of conceptual jokes.[1] We shall describe the peculiarity of this technique far more appropriately if, instead of representation by something 'akin', we say by something 'correlated' or 'connected'. We will take our start, in fact, with this latter characteristic and illustrate it at once by an example.

Here is an American anecdote:[2] 'Two not particularly scrupulous businessmen had succeeded, by dint of a series of highly risky enterprises, in amassing a large fortune, and they were now making efforts to push their way into good society. One method, which struck them as a likely one, was to have their portraits painted by the most celebrated and highly paid artist in the city, whose pictures had an immense reputation. The precious canvases were shown for the first time at a large evening party, and the two hosts themselves led the most influential connoisseur and art critic up to the wall upon which the portraits were hanging side by side, to extract his admiring judgement on them. He studied the works for a long time, and then, shaking his head, as though there was something he had missed, pointed to the gap between the pictures and asked quietly: "But where's the Saviour?"' (I.e. 'I don't see the picture of the Saviour'.)

The meaning of this remark is clear. It is once again a question of the representation of something that cannot be expressed directly. How does this 'indirect representation' come about? Starting from the representation in the joke, we trace the path backwards through a series of easily established associations and inferences.

We can guess from the question 'Where's the Saviour? Where's the [75]
picture of the Saviour?' that the sight of the two pictures had reminded the speaker of a similar sight, familiar to him, as to us, which, however, included an element that was missing here – the picture of the Saviour between two other pictures. There is only one such situation: Christ hanging between the two thieves. The missing element is brought into prominence by the joke. The similarity lies in the pictures, hanging to the

1 [As contrasted with verbal jokes. See below, p. 79.]

2 [The anecdote was used again by Freud in the third of his lectures at Clark University (1910*a*), *RSE*, **11**, 30–1.]

right and left of the Saviour, which the joke passes over; it can only consist in the fact that the pictures hanging on the walls are pictures of thieves. What the critic wanted to say but could not say was: 'You are a couple of rascals' or, in greater detail: 'What do I care about your pictures? You are a couple of rascals – I know that!' And he did in fact end by saying it by means of a few associations and inferences, using the method which we speak of as an 'allusion'.

We at once recall where we have already come across allusion – in connection, namely, with double meaning. When two meanings are expressed in one word and one of them is so much more frequent and usual that it occurs to us at once, while the second is more out of the way and therefore less prominent, we proposed to speak of this as 'double meaning with an allusion' [p. 36 above]. In a whole number of the examples we have already examined we remarked that the technique was not a simple one, and we now perceive that the 'allusion' was the complicating factor in them. (See, for instance, the inversion joke about the wife who has lain back a bit and so has been able to earn a lot [p. 29] or the nonsensical joke about the man who replied to congratulations on the birth of his youngest child by saying that it was remarkable what human hands could accomplish [p. 52].)

In the American anecdote we now have before us an allusion without any double meaning, and we see that its characteristic is replacement by something linked to it in a conceptual connection. It may easily be guessed that the utilizable connection can be of more than one kind. In order not to lose ourselves in a maze of detail, we will discuss only the most marked variants and these only in a few examples.

The connection used for the replacement may be merely a re-
[76] semblance in sound, so that this subspecies becomes analogous to puns among verbal jokes. Here, however, it is not the resemblance in sound between two *words*, but between whole sentences, characteristic phrases, and so on.

For instance, Lichtenberg coined the saying: 'New spas cure well', which at once reminds us of the proverb: 'New brooms sweep clean.' The two phrases share the first one and a half words and the last word, as well as the whole structure of the sentence.[1] And there is no doubt that the sentence came into the witty philosopher's head as an imitation of the familiar proverb. Thus Lichtenberg's saying becomes an allusion to the proverb. By means of this allusion something is

1 [In the German the first syllables of 'spas' (*Bäder*) and 'brooms' (*Besen*) sound alike; and in the German proverb the last word is 'well' (*gut*).]

suggested that is not said straight out – namely that something else is responsible for the effects produced by spas besides the unvarying characteristics of thermal springs.

A similar technical solution applies to another jest [*Scherz*] or joke [*Witz*][1] of Lichtenberg's: 'A girl scarcely twelve *Moden* [modes] old.' This sounds like 'twelve *Monden*' [moons], i.e. months, and may originally have been a slip of the pen for the latter, which is a permissible expression in poetry. But it also makes good sense to use the changing fashion instead of the changing moon as a method of determining a woman's age.

The connection may also consist in similarity except for a 'slight modification'. So that this technique, too, is parallel to a verbal technique [pp. 29–30 above]. Both species of joke make almost the same impression, but they can be better distinguished from each other if we consider the processes of the joke-work.

Here is an example of a verbal joke or pun of this kind: Marie Wilt was a great singer, famous, however, for the compass not only of her voice. She suffered the humiliation of having the title of a play based on Jules Verne's well-known novel used as an allusion to her misshapen figure: 'Round the Wilt in 80 Days'.[2]

Or: 'Every fathom a queen', a modification of Shakespeare's familiar 'Every inch a king'. The allusion to this quotation was made with [77]
reference to an aristocratic and over-life-size lady. No very serious objection could really be made if anyone were to prefer to include this joke among the 'condensations accompanied by modifications as substitute'. (See '*tête-à-bête*' [pp. 22–3].)

A friend said of someone who had lofty views but was obstinate in the pursuit of his aims: 'Er hat ein Ideal vor dem Kopf' [He has an ideal in front of his head]. The current phrase is: 'Ein Brett vor dem Kopf haben' [literally 'to have a board in front of one's head' – 'to be dense']. The modification alludes to this phrase and makes use of its meaning for its own purposes. Here, once more, the technique might be described as 'condensation with modification'.

It is almost impossible to distinguish between 'allusion by means of modification' and 'condensation with substitution', if the modification is limited to a change of letters. For instance: 'Di*ch*teritis'.[3] This allusion

1 [The distinction between the two is discussed at length in a later chapter (p. 113 ff. below).]

2 [The German for 'world' is '*Welt*'.]

3 [A non-existent word, which might be translated 'authoritis' – from '*Dichter*' (an author).]

to the scourge of 'Di*ph*teritis' [diphtheria] represents authorship by unqualified persons as another public danger.

Negative particles make very neat allusions possible at the cost of slight alterations:

'My fellow *un*believer Spinoza', says Heine. 'We, by the *un*grace of God, day-labourers, serfs, negroes, villeins . . .' is how Lichtenberg begins a manifesto (which he carries no further) made by these unfortunates – who certainly have more right to this title than kings and princes have to its unmodified form.

Finally, another kind of allusion consists in 'omission', which may be compared to condensation without the formation of a substitute. Actually, in every allusion something is omitted, viz. the train of thought leading to the allusion. It only depends on whether the more obvious thing is the gap in the wording of the allusion or the substitute which partly fills the gap. Thus a series of examples would lead us back from blatant omission to allusion proper.

Omission without a substitute is shown in the following example:[1] There is a witty and pugnacious journalist in Vienna, whose biting invec-
[78] tive has repeatedly led to his being physically maltreated by the subjects of his attacks. On one occasion, when a fresh misdeed on the part of one of his habitual opponents was being discussed, somebody exclaimed: 'If X hears of this, he'll get his ears boxed again.'[2] The technique of this joke includes, in the first place, bewilderment at its apparent nonsense, since we cannot see how getting one's ears boxed can be an immediate consequence of having heard something. The absurdity of the remark disappears if we insert in the gap: 'he'll write such a scathing article upon the man that . . . etc.' Allusion by means of omission, combined with nonsense, are accordingly the technical methods used in this joke.

'He praises himself so much that the price of fumigating candles is going up.' (Heine.) This gap is easy to fill. What is omitted has been replaced by an inference, which then leads back to what has been omitted, in the form of an allusion: 'self-praise stinks.'

And now once again two Jews outside the bath-house:

One of them sighed: 'Another year gone by already!'

These examples leave us in no doubt that here the omission forms part of the allusion.

1 [Freud quoted this example in a footnote to his analysis of the 'Rat Man' (1909*d*), to illustrate the use of a similar technique in obsessional symptoms. (*RSE*, **10**, 172 *n*. 2.)]

2 [This anecdote is repeated in the 'Rat Man' case history (ibid., **10**, 210). There the 'X' in question is identified as Karl Kraus, who has already been referred to above (p. 24). Another of his jokes was quoted by Freud in his paper '"Civilized" Sexual Morality' (1908*d*), *RSE*, **9**, 173–4.]

There is still quite a marked gap to be seen in our next example, though it is a genuine and correct allusive joke. After an artists' carnival in Vienna a jest book was circulated, in which, among others, the following highly remarkable epigram appeared:

'A wife is like an umbrella. Sooner or later one takes a cab.'

An umbrella is not enough protection against rain. The 'sooner or later' can only mean 'if it rains hard', and a cab is a public vehicle. But since we are only concerned here with the *form* of the analogy, we will postpone the closer examination of this joke to a later moment. [See p. 97 f. below.]

Heine's 'Bäder von Lucca' contains a regular wasps' nest of the most stinging allusions and makes the most ingenious use of this form of joke for polemical purposes (against Count Platen).[1] Long before the reader can suspect what is afoot, there are foreshadowings of a particular theme, [79]
peculiarly ill-adapted for direct representation, by allusions to material of the most varied kind – for instance, in Hirsch-Hyacinth's verbal contortions: 'You are too stout and I am too thin; you have a good deal of imagination and I have all the more business sense; I am a practicus and you are a *diarrheticus*; in short you are my complete anti*podex*.' – 'Venus *Urinia*' – 'the stout Gudel von *Dreck*wall' of Hamburg, and so on.[2] In what follows, the events described by the author take a turn which seems at first merely to display his mischievous spirit but soon reveals its symbolic relation to his polemical purpose and at the same time shows itself as allusive. Eventually[3] the attack on Platen bursts out, and thenceforward allusions to the theme (with which we have already been made acquainted) of the Count's love for men gushes out and overflows in every sentence of Heine's attack on his opponent's talents and character. For instance:

'Even though the Muses do not favour him, he has the Genius of Speech in his power, or rather he knows how to do violence to him. For he does not possess the free love of that Genius, he must unceasingly pursue this young man, too, and he knows how to capture only the outer forms, which, despite their lovely curves, never speak nobly.'

1 [August, Count von Platen (1796–1835), the lyric poet, had aroused Heine's enmity by a satirical work on the romantic movement. He was a sublimated homosexual.]

2 [These instances all touch on anal material. Venus 'Urinia', though on the surface suggesting urine, is a malapropism for 'Urania', the heavenly, homosexual, love of Plato's *Symposium*. 'Gudel' was a real, aristocratic and wealthy Hamburg lady, to whom Hyacinth here gives the anal-sounding pseudonym of 'Dreckwall'. (*Dreck* = excrement.) All these examples can be found in Chapter IX of 'Die Bäder von Lucca' (Part III of Heine's *Reisebilder*). The rest of that chapter is concerned with predominantly anal anecdotes.]

3 [In Chapter XI, the last in the book.]

'He is like the ostrich, which believes he is well hidden if he sticks his head in the sand, so that only his behind can be seen. Our exalted bird would have done better to hide his behind in the sand and show us his head.'

[80] Allusion is perhaps the commonest and most easily manageable method of joking and is at the bottom of the majority of shortlived jokes which we are accustomed to weaving into our conversations and which will not bear being uprooted from their original soil and kept in isolation. But it precisely reminds us once more of the fact that had begun to puzzle us in our consideration of the technique of jokes. An allusion in itself does not constitute a joke; there are correctly constructed allusions which have no claim to such a character. Only allusions that possess that character can be described as jokes. So that the criterion of jokes, which we have pursued into their technique, eludes us there once again.

I have occasionally described allusion as 'indirect representation'; and we may now observe that the various species of allusion, together with representation by the opposite and other techniques that have still to be mentioned, may be united into a single large group, for which 'indirect representation' would be the most comprehensive name. 'Faulty reasoning', 'unification', 'indirect representation' – these, then, are the headings under which we can classify those techniques of conceptual jokes which we have come to know.

If we examine our material further, we seem to recognize a fresh subspecies of indirect representation which can be precisely characterized but of which few examples can be adduced. This is representation by something small or very small[1] – which performs the task of giving full expression to a whole characteristic by means of a tiny detail. This group can be brought under the classification of 'allusion', if we bear in mind that this smallness is related to what has to be represented, and can be seen to proceed from it. For instance:

'A Galician Jew was travelling on a train. He had made himself really comfortable, had unbuttoned his coat and put his feet up on the seat. Just then a gentleman in modern dress entered the compartment. The Jew promptly pulled himself together and took up a proper pose. The stranger fingered through the pages of a notebook, made some calculations, reflected for a moment and then suddenly asked the Jew: "Excuse me,

1 [Displacement on to something very small was later recognized by Freud as a characteristic mechanism in obsessional neurosis. See the 'Rat Man' case history (1909*d*), *RSE*, **10**, 182–3 and 184–5.]

when is Yom Kippur (the Day of Atonement)?" "Oho!"[t] said the Jew, [81]
and put his feet up on the seat again before answering.'

It cannot be denied that this representation by something small is related to the 'tendency to economy' which we were left with as the last common element after our investigation of verbal technique [p. 37 ff. above].

Here is a very similar example:

'The doctor, who had been asked to look after the Baroness at her confinement, pronounced that the moment had not come, and suggested to the Baron that in the meantime they should have a game of cards in the next room. After a while a cry of pain from the Baroness struck the ears of the two men: "Ah, mon Dieu, que je souffre!" Her husband sprang up, but the doctor signed to him to sit down: "It's nothing. Let's go on with the game!" A little later there were again sounds from the pregnant woman: "Mein Gott, mein Gott, what terrible pains!" – "Aren't you going in, Professor?" asked the Baron. – "No, no. It's not time yet." – At last there came from next door an unmistakable cry of "Aa-ee, aa-ee, aa-ee!" The doctor threw down his cards and exclaimed: "*Now* it's time.'"

This successful joke demonstrates two things from the example of the way in which the cries of pain uttered by an aristocratic lady in childbirth changed their character little by little. It shows how pain causes primitive nature to break through all the layers of education, and how an important decision can be properly made to depend on an apparently trivial phenomenon.

[12]

There is another kind of indirect representation used by jokes, namely the 'analogy'. We have kept it back so long because the consideration of it comes up against new difficulties, or makes particularly evident difficulties that we have already come up against in other connections. We have already admitted that in some of the examples we have examined we have not been able to banish a doubt as to whether they ought to be regarded as jokes at all [e.g. pp. 44 and 53 f. above]; and in this uncertainty we have recognized that the foundations of our enquiry have been seriously shaken. But I am aware of this uncertainty in no other material [82]
more strongly or more frequently than in jokes of analogy. There is a feeling – and this is probably true of a large number of other people under the same conditions – which tells me 'this is a joke, I can pronounce this to be a joke' even before the hidden essential nature of jokes has been discovered. This feeling leaves me in the lurch most

often in the case of joking analogies. If to begin with I unhesitatingly pronounce an analogy to be a joke, a moment later I seem to notice that the enjoyment it gives me is of a quality different from what I am accustomed to derive from a joke. And the circumstance that joking analogies are very seldom able to provoke the explosive laugh which signals a good joke makes it impossible for me to resolve the doubt in my usual way – by limiting myself to the best and most effective examples of a species.

It is easy to demonstrate that there are remarkably fine and effective examples of analogies that do not in the least strike us as being jokes. The fine analogy between the tenderness in Ottilie's diary and the scarlet thread of the English navy (p. 21 *n.* 3) is one such. And I cannot refrain from quoting in the same sense another one, which I never tire of admiring and the effect of which I have not grown out of. It is the analogy with which Ferdinand Lassalle ended one of his celebrated speeches for the defence ('Science and the Workers'): 'Upon a man such as I have shown you this one to be, who has devoted his life to the watchword "Science and the Workers", being convicted, if it were his lot, would make no more impression than would the bursting of a retort upon a chemist deep in his scientific experiments. As soon as the interruption is past, with a slight frown over the rebelliousness of his material, he will quietly pursue his researches and his labours.'

A rich selection of apt and joking analogies are to be found among Lichtenberg's writings (the second volume of the Göttingen edition of 1853), and it is from there that I shall take the material for our investigation.

'It is almost impossible to carry the torch of truth through a crowd without singeing someone's beard.'

No doubt that seems to be a joke; but on closer examination we notice that the joking effect does not arise from the analogy itself but from a subsidiary characteristic. 'The torch of truth' is not a new analogy but
[83] one that has been common for a very long time and has become reduced to a cliché – as always happens when an analogy is lucky and accepted into linguistic usage. Though we scarcely notice the analogy any longer in the phrase 'the torch of truth', it is suddenly given back its full original force by Lichtenberg, since an addition is now made to the analogy and a consequence is drawn from it. But we are already familiar with a process like this of giving its full meaning to a watered-down expression as a technique of joking. It finds a place in the multiple use of the same material (p. 30 ff.). It might quite well be that the joking impression

produced by Lichtenberg's remark arises only from its dependence on this joke technique.

The same judgement may certainly apply as well to another joking analogy by the same author:

'To be sure, the man was not a great light [*Licht*], but a great candlestick [*Leuchter*] . . . He was a professor of philosophy.'

To describe a man of learning as a great light, a *lumen mundi*, has long ceased to be an effective analogy, whether or not it originally had an effect as a joke. But the analogy is refreshed, it is given back its full force, if a modification is derived from it and a second, new, analogy is thus obtained from it. The way in which this second analogy comes about seems to be what determines the joke, not the two analogies themselves. This would be an instance of the same joke technique as in the example of the torch.

The following example seems to have the character of a joke for another reason, but one that must be judged similarly:

'Reviews seem to me to be a kind of childhood illness to which newborn books are more or less liable. There are examples of the healthiest dying of it; and the weakest often get through it. Some escape it altogether. Attempts have often been made to guard against it by the amulets of preface and dedication, or even to inoculate against it by judgements of one's own. But this does not always help.'

The comparison of reviews to a childhood illness is founded in the first instance on the fact of being exposed to them shortly after first seeing the light of day. I cannot venture to decide whether up to this point the comparison has the character of a joke. But it is then carried further: it turns out that the subsequent fate of new books can be represented within the framework of the same analogy or through [84] related analogies. A prolongation like this of an analogy is undoubtedly in the nature of a joke, but we already know what technique it has to thank for this – it is a case of unification, the making of an unsuspected connection. The character of the unification is not altered by the fact that here it consists in making an addition to a previous analogy.

In another group of analogies one is tempted to shift what is undoubtedly an impression that has the character of a joke on to another factor, which once again has in itself nothing to do with the nature of the analogy. These are analogies which contain a striking juxtaposition, often a combination that sounds absurd, or which are replaced by something of the sort as the outcome of the analogy. The majority of the Lichtenberg examples belong to this group.

'It is a pity that one cannot see the learned entrails of authors so as to discover what they have eaten.' The 'learned' entrails is a bewildering and indeed absurd epithet, which is only explained by the analogy. What if the impression of its being a joke were due entirely to the bewildering character of the juxtaposition? If so, it would correspond to a method of joking with which we are quite familiar – 'representation by absurdity' [p. 49 ff. above].

Lichtenberg has used the same analogy between the ingestion of reading and instructive matter and the ingestion of physical nourishment for another joke:

'He thought very highly of learning at home, and was therefore entirely in favour of learned stall-feeding.'

Other analogies by the same author exhibit the same absurd, or at least remarkable, assignment of epithets, which, as we now begin to see, are the true vehicles of the joke:

'That is the weather side of my moral constitution; I can stand things there quite well.'

'Everyone has his moral backside,[1] which he does not show except in case of need and which he covers as long as possible with the breeches of respectability.'

'Moral backside' – the assignment of this remarkable epithet is the outcome of an analogy. But in addition, the analogy is continued further
[85] with an actual play upon words – 'need' – and a second even more unusual juxtaposition ('the breeches of respectability'), which is perhaps a joke in itself; for the breeches, since they are the breeches of respectability, themselves, as it were, become a joke. We need not be surprised, then, if the whole gives us the impression of being an analogy that is a very good joke. We begin to notice that we are inclined, quite generally, where a characteristic attaches only to a part of a whole, to extend it in our estimation to the whole itself. The 'breeches of respectability', incidentally, recall some similarly bewildering lines of Heine's:

> . . . Bis mir endlich,
> endlich alle Knöpfe rissen
> an der hose der Geduld.
>
> [. . . Till at last,
> at last every button bursts
> on my breeches of patience.][2]

1 [In English.]

2 [*Romanzero*, Book III (*Hebräische Melodien*), Jehuda ben Halevy IV.]

There can be no doubt that these last two analogies have a characteristic that we do not find in every good (that is to say, in every apt) analogy. They are to a great degree 'debasing', as we might put it. They juxtapose something of a high category, something abstract (in these instances, 'respectability' and 'patience'), with something of a very concrete and even low kind ('breeches'). We shall have to consider in another connection whether this peculiarity has anything to do with the joke. Here we will try to analyse another example in which this disparaging characteristic is quite specially plain. Weinberl, the clerk in Nestroy's farce *Einen Jux will er sich machen* [*He wants to have a spree*], pictures to himself how one day, when he is a respectable old businessman, he will remember the days of his youth: 'When the ice in front of the warehouse of memory has been hacked up like this in a friendly talk', he says, 'when the arched doorway of old times has been unlocked again and the showcase of the imagination is fully stocked with goods from the past. . . .'[1] These are, to be sure, analogies between abstract and very commonplace concrete things; but the joke depends – whether entirely or in part – on the fact that a clerk is making use of analogies taken from the domain of his everyday activities. But the bringing of these abstractions into connection with the ordinary things with which his life is normally filled is an act of *unification*. [86]

Let us return to the Lichtenberg analogies:

'The motives[2] that lead us to do anything might be arranged like the thirty-two winds [= points of the compass] and might be given names in a similar way: for instance, "bread-bread-fame" or "fame-fame-bread".'[3] As is so often the case with Lichtenberg's jokes, the impression of something apt, witty and shrewd is so prominent that our judgement upon the nature of what constitutes the joke is misled by it. If some amount of joke is admixed with the admirable meaning in a remark of this kind, we are probably led into declaring that the whole thing is an excellent joke. I should like, rather, to hazard the statement that everything in it that is really in the nature of a joke arises from our surprise at the strange combination 'bread-bread-fame'. As a joke, therefore, it would be a 'representation by absurdity'.

1 [This is in Austrian dialect in the original.]

2 [*Bewegungsgründe* in the German original, to which Freud appends a footnote saying that '*Motive*'[T] is the modern equivalent term. But see *RSE*, **24**, 77.]

3 [Freud returned to this analogy nearly thirty years later in his open letter to Einstein *Why War?* (1933*b*), ibid., **22**, 220.]

A strange juxtaposition or the attribution of an absurd epithet can stand by itself as the outcome of an analogy:

'A *zweischläfrige* woman.' 'An *einschläfriger* church pew.'[1] (Both by Lichtenberg.) Behind both of these there is an analogy with a bed; in both of them, besides the 'bewilderment' the technical factor of 'allusion' is in operation – an allusion in one case to the sleepy effects of sermons and in the other to the inexhaustible topic of sexual relations.

So far we have found that whenever an analogy strikes us as being in the nature of a joke it owes this impression to the admixture of one of the joke techniques that are familiar to us. But a few other examples seem at last to provide evidence that an analogy can in itself be a joke.

This is how Lichtenberg describes certain odes:

'They are in poetry what Jakob Böhme's[2] immortal works are in prose – a kind of picnic, in which the author provides the words and the reader the sense.'

[87] 'When he philosophizes, he throws as a rule an agreeable moonlight over things, which pleases in general but shows no single thing clearly.'

Or here is Heine:

'Her face resembled a palimpsest, on which, beneath the fresh black monastic manuscript of the text of a Church Father, there lurk the half-obliterated lines of an ancient Greek love poem.' [*Harzreise*.]

Or let us take the lengthy analogy, with a highly degrading[3] purpose, in the 'Bäder von Lucca' [*Reisebilder*, III]:

'A Catholic cleric behaves rather like a clerk with a post in a large business house. The Church, the big firm, of which the Pope is head, gives him a fixed job and, in return, a fixed salary. He works lazily, as everyone does who is not working for his own profit, who has numerous colleagues and can easily escape notice in the bustle of a large concern. All he has at heart is the credit of the house and still more its maintenance, since if it should go bankrupt he would lose his livelihood. A Protestant cleric, on the other hand, is in every case his own principal and carries on the business of religion for his own profit. He does not, like his Catholic fellow traders, carry on a wholesale business but only retail. And since he must himself manage it alone, he cannot be lazy. He must advertise his articles of faith, he must depreciate his competitors' articles, and, genuine retailer that he is, he stands in his retail shop, full of business envy of

1 [These two German words – meaning literally 'that can sleep two' and 'that can sleep one' – are ordinarily applied to beds, i.e. 'double' and 'single'. *Einschläfrig*, however, can also mean 'soporific'.]

2 [Jakob Böhme (1575–1624), the German Protestant mystic.]

3 [See below, p. 173 *n*. 3.]

all the great houses, and particularly of the great house in Rome, which pays the wages of so many thousands of bookkeepers and packers and has its factories in all four quarters of the globe.'

In the face of this and many other examples, we can no longer dispute the fact that an analogy can in itself possess the characteristic of being a joke, without this impression being accounted for by a complication with one of the familiar joke techniques. But, that being so, we are completely at a loss to see what it is that determines the joking characteristic of analogies, since that characteristic certainly does not reside in analogy as a form of expression of thought or in the operation of making a comparison. All we can do is to include analogy among the species of 'indirect representation' used by the joke technique and we must leave unresolved [88]
the problem which we have met with much more clearly in the case of analogies than in the methods of joking that we came across earlier. No doubt, moreover, there must be some special reason why the decision whether or not something is a joke offers greater difficulties in analogies than in other forms of expression.

This gap in our understanding gives us no grounds, however, for complaining that this first investigation has been without results. In view of the intimate connection which we must be prepared to attribute to the different characteristics of jokes, it would be imprudent to expect that we could completely explain one side of the problem before we have so much as cast a glance at the others. We shall no doubt have now to attack the problem from another direction.

Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work – at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes – displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite – which reappear one and all in the

technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the
[89] opposite is so common in dreams that even the popular books of dream interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation – the replacement of a dream thought by an allusion, by something small, a symbolism akin to analogy – is precisely what distinguishes the mode of expression of dreams from that of our waking life.[1] So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks. [See Chapter VI below.]

1 Cf. Chapter VI ('The Dream-Work') of my *Interpretation of Dreams* [(1900*a*), *RSE*, **4**, 246 ff.].

III
THE PURPOSES OF JOKES

[1]

When at the end of my last chapter I wrote down Heine's comparison of [90]
a Catholic priest to an employee in a wholesale business and of a Protestant one to a retail merchant, I was aware of an inhibition which was trying to induce me not to make use of the analogy. I told myself that among my readers there would probably be a few who felt respect not only for religion but for its governors and assistants. Such readers would merely be indignant about the analogy and would get into an emotional state which would deprive them of all interest in deciding whether the analogy had the appearance of being a joke on its own account or as a result of something extra added to it. With other analogies – for instance, the neighbouring one of the agreeable moonlight which a particular philosophy throws over things – there seemed to be no need for worry about the disturbing effect they might have on a section of my readers. The most pious man would remain in a state of mind in which he could form a judgement on our problem.

It is easy to divine the characteristic of jokes on which the difference in their hearers' reaction to them depends. In the one case the joke is an end in itself and serves no particular aim, in the other case it does serve such an aim – it becomes *tendentious*. Only jokes that have a purpose[1] run the risk of meeting with people who do not want to listen to them.

Non-tendentious jokes were described by Vischer as 'abstract' jokes. I prefer to call them 'innocent' jokes.

Since we have already divided jokes into 'verbal' and 'conceptual' jokes according to the material handled by their technique, it devolves on us now to examine the relation between that classification and the [91]
new one that we are introducing. The relation between verbal and conceptual jokes on the one hand and abstract and tendentious jokes on the other is not one of mutual influence; they are two wholly independent classifications of joking products. Some people may perhaps have gained an impression that innocent jokes are predominantly verbal jokes, but

1 [The German substantive '*Tendenz*' is throughout this book translated 'purpose'. (Cf. 'a play with a purpose'.) The German adjective derived from it (*tendenziös*), however, has become a naturalized English word and is accordingly translated here 'tendentious'.]

that the more complex technique of conceptual jokes is mostly employed for definite purposes. But there are innocent jokes that work with play upon words and similarity of sound, and equally innocent ones that employ all the methods of conceptual jokes. And it is just as easy to show that a tendentious joke need be nothing other than a verbal joke as regards its technique. For instance, jokes that 'play about' with proper names often have an insulting and wounding purpose, though, needless to say, they are verbal jokes. But the most innocent of all jokes are once more verbal jokes; for instance, the *Schüttelreime*,[1] which have recently become so popular and in which the multiple use of the same material with a modification entirely peculiar to it constitutes the technique:

> Und weil er Geld in *M*enge *h*atte,
> lag stets er in der *H*änge*m*atte.
>
> [And because he had money in quantities
> He always lay in a hammock.]

It may be hoped that no-one will question that the enjoyment derived from these otherwise unpretentious rhymes is the same as that by which we recognize jokes.

Good examples of abstract or innocent conceptual jokes are to be found in plenty among the Lichtenberg analogies, with some of which we have already become acquainted. I add a few more:

'They had sent a small octavo volume to Göttingen, and had got back something that was a quarto in body and soul.'

'In order to erect this building properly, it is above all necessary that good foundations shall be laid; and I know of none firmer than if, upon every course of masonry *pro*, one promptly lays a course *contra*.'

[92] 'One person procreates a thought, a second carries it to be baptized, a third begets children by it, a fourth visits it on its deathbed and a fifth buries it.' (Analogy with unification.)

'Not only did he disbelieve in ghosts; he was not even frightened of them.' Here the joke lies entirely in the nonsensical form of representation, which puts what is commonly thought less of into the comparative and uses the positive for what is regarded as more important. If this joking envelope[t] is removed, we have: 'it is much easier to get rid of a fear of ghosts intellectually than to escape it when the occasion arises.'

1 [Literally 'shaking-up rhymes'. It will be seen that these are a rhyming form of what we know as 'Spoonerisms'.]

This is no longer in the least a joke, though it is a correct and still too little appreciated psychological discovery – the same one which Lessing expressed in a well-known sentence:

'Not all are free who mock their chains.'[1]

I may take the opportunity that this affords of getting rid of what is nevertheless a possible misunderstanding. For 'innocent' or 'abstract' jokes are far from having the same meaning as jokes that are 'trivial' or 'lacking in substance' [*gehaltlos*]; they merely connote the opposite of the 'tendentious' jokes that will be discussed presently. As our last example shows, an innocent – that is, a non-tendentious – joke may also be of great substance [*gehaltvoll*], it may assert something of value. But the substance of a joke is independent of the joke and is the substance [*Gehalt*] of the thought, which is here, by means of a special arrangement, expressed as a joke. No doubt, just as watchmakers usually provide a particularly good movement with a similarly valuable case, so it may happen with jokes that the best achievements in the way of jokes are used as an envelope for thoughts of the greatest substance.

If now we draw a sharp distinction in the case of conceptual jokes between the substance [*Gehalt*] of the thought and the joking envelope, we shall reach a discovery which may throw light on much of our uncertainty in judging jokes. For it turns out – and this is a surprising thing – that our enjoyment of a joke is based on a combined impression of its substance and of its effectiveness as a joke and that we let ourselves be deceived by the one factor over the amount of the other. Only after the joke has been reduced do we become aware of this false judgement.

Moreover, the same thing is true of verbal jokes. When we are told [93]
that 'experience consists in experiencing what one does not wish to experience' [p. 58 above], we are bewildered and think we have learnt a new truth. It is a little time before we recognize under this disguise the platitude of 'Injury makes one wise'. [Adversity is the best teacher.] (Fischer [1889, 59].) The apt way in which the joke succeeds in defining 'experience' almost purely by the use of the verb 'to experience' deceives us into overvaluing the substance of the sentence. Just the same thing is true of Lichtenberg's 'January' joke of unification (p. 58), which has nothing more to tell us than something we have already long known – that New Year's wishes come true as seldom as other wishes. So too in many similar cases.

1 [*Nathan der Weise*, Act IV, Scene 4.]

And we find just the contrary with other jokes, in which the aptness and truth of the thought tricks us into calling the whole sentence a brilliant joke – whereas only the thought is brilliant and the joke's achievement is often feeble. Precisely in Lichtenberg's jokes the kernel of thought is frequently far more valuable than the joking envelope to which we unjustifiably extend our appreciation. Thus, for instance, the remark about the 'torch of truth' (p. 72) is an analogy that scarcely amounts to a joke, but it is so apt that we are inclined to insist that the sentence is a particularly good joke.

Lichtenberg's jokes are outstanding above all on account of their intellectual content and the certainty with which they hit their mark. Goethe was quite right in saying of that author that, in fact, his joking and jesting ideas concealed problems; it would have been even more correct to say that they touch on the solution to problems. When, for instance, he remarked as a joke: 'He had read Homer so much that he always read "*Agamemnon*" instead of "*angenommen* [supposed]"' – the technique used is 'stupidity' plus 'similarity of sound' – Lichtenberg had discovered nothing less than the secret of misreading.[1]

Similarly with a joke the technique of which struck us as most unsatisfactory (p. 52): 'He wondered how it is that cats have two holes cut in their skin precisely at the place where their eyes are'. The stupidity that is paraded here is only apparent. In fact, behind this simple remark lies
[94] the great problem of teleology in the structure of animals. It was by no means so completely a matter of course that the palpebral fissure should open at the point at which the cornea is exposed, until the theory of evolution had thrown light on the coincidence.

We shall bear in mind the fact that we receive from joking remarks a total impression in which we are unable to separate the share taken by the thought content from the share taken by the joke-work. It may be that later on we shall find a still more significant parallel to this. [Cf. p. 119 below.]

[2]

From the point of view of throwing theoretical light on the nature of jokes, innocent jokes are bound to be of more value to us than tendentious ones, and trivial jokes of more value than profound ones. Innocent

1 See my *Psychopathology of Everyday Life* (1901*b*) [Chapter X. See also Chapter VI (A), Example 8 (added in 1910). The joke is also discussed at the end of the second of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 35.]

and trivial jokes are likely to put the problem of jokes before us in its purest form, since with them we avoid the danger of being confused by their purpose or having our judgement misled by their good sense. On the basis of such material our discoveries can make fresh advances.

I will select the most innocent possible example of a verbal joke:

'A girl to whom a visitor was announced while she was at her toilet complained: "Oh, what a shame that one mayn't let oneself be seen just when one's at one's most *anziehend*!"'[1] (Kleinpaul, 1890.)

Since, however, doubts arise in me after all as to whether I have a right to describe this joke as being non-tendentious, I will replace it with another one which is extremely simple and should really not be open to that objection.

At the end of a meal in a house to which I had been invited as a guest, a pudding of the kind known as a '*Roulard*'[2] was served. It requires some skill on the part of the cook to make it; so one of the guests asked: 'Made in the house?' To which the host replied: 'Yes, indeed. A home-*roulard*.'[3]

This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most [95] important one. When those of us present heard this improvised joke it gave us pleasure – which I can clearly recall – and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described – condensation, displacement, indirect representation and so on – thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 16) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has, in fact, taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression with another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh – our enjoyment of the joke.

1 ['*Anziehend*' means both 'dressing' and 'attractive'.]

2 [This should perhaps be spelt '*Roulade*'.]

3 [In the original the words 'Home Rule' are added in English.]

We cannot proceed further at this point without a discussion with our philosophical authorities.

The philosophers, who count jokes a part of the comic and who treat of the comic itself under the heading of aesthetics, define an aesthetic idea by the condition that in it we are not trying to get anything from things or do anything with them, that we are not using things in order to satisfy one of our major vital needs, but that we are content with contemplating them and with the enjoyment of the idea. 'This enjoyment, this kind of ideation, is the purely aesthetic one, which lies only in itself, which has its aim only in itself and which fulfils none of the other aims of life.' (Fischer, 1889, 20.) [Cf. p. 9 f. above.]

We shall scarcely be contradicting this statement of Fischer's – we shall perhaps be doing no more than translating his thoughts into our mode of expression – if we insist that the joking activity should not, after all, be described as pointless or aimless, since it has the unmistakable aim of evoking pleasure in its hearers. I doubt if we are in a position to undertake *anything* without having an intention in view. If we do not require
[96] our mental apparatus at the moment for supplying one of our indispensable satisfactions, we allow it itself to work in the direction of pleasure and we seek to derive pleasure from its own activity. I suspect that this is in general the condition that governs all aesthetic ideation, but I understand too little of aesthetics to try to enlarge on this statement. As regards joking, however, I can assert, on the basis of the two discoveries we have already made, that it is an activity which aims at deriving pleasure from mental processes, whether intellectual or otherwise. No doubt there are other activities which have the same aim. They are perhaps differentiated according to the fields of mental activity from which they seek to derive pleasure or perhaps according to the methods of which they make use. We cannot for the moment decide about this; but we hold firmly to the view that the joke technique and the tendency towards economy by which it is partly governed (p. 37 ff.) have been brought into connection with the production of pleasure.

But before we set about solving the riddle of how the technical methods of the joke-work are able to excite pleasure in the hearer, we have to recall the fact that, with a view to simplification and greater perspicuity, we have left tendentious jokes entirely on one side. We must, after all, try to throw light on the question of what the purposes of jokes are, and how they serve those purposes.

There is, first and foremost, one observation which warns us not to leave tendentious jokes on one side in our investigation of the origin of

the pleasure we take in jokes. The pleasurable effect of innocent jokes is as a rule a moderate one; a clear sense of satisfaction, a slight smile, is as a rule all it can achieve in its hearers. And it may be that a part even of this effect is to be attributed to the joke's intellectual content, as we have seen from suitable examples (p. 81 f.). A non-tendentious joke scarcely ever achieves the sudden burst of laughter which makes tendentious ones so irresistible.[1] Since the technique of both can be the same, a suspicion may be aroused in us that tendentious jokes, by virtue of their purpose, must have sources of pleasure at their disposal to which innocent jokes have no access.

The purposes of jokes can easily be reviewed. Where a joke is not an aim in itself – that is, where it is not an innocent one – there are only two [97] purposes that it may serve, and these two can themselves be subsumed under a single heading. It is either a *hostile* joke (serving the purpose of aggressiveness, satire or defence) or an *obscene* joke (serving the purpose of exposure). It must be repeated in advance that the technical species of the joke – whether it is a verbal or a conceptual joke – bears no relation to these two purposes.

It is a much lengthier business to show the way in which jokes serve these two purposes. In this investigation I should prefer to deal first not with the hostile jokes but with the exposing jokes. It is true that these have been far more rarely deemed worthy of investigation, as though aversion to the thing itself had here been transferred to the discussion of it. But we will not allow ourselves to be disconcerted by this, for we shall immediately come upon a marginal case of joking which promises to bring us enlightenment on more than one obscurity.

We know what is meant by 'smut': the intentional bringing into prominence of sexual facts and relations by speech. This definition, however, is no more valid than other definitions. In spite of this definition, a lecture on the anatomy of the sexual organs or the physiology of procreation need not have a single point of contact with smut. It is a further relevant fact that smut is directed to a particular person, by whom one is sexually excited and who, on hearing it, is expected to become aware of the speaker's excitement and as a result to become sexually excited in turn. Instead of this excitement the other person may be led to feel shame or embarrassment, which is only a reaction against the excitement and, in a roundabout way, is an admission of it. Smut is thus originally directed towards women and may be equated with attempts at seduction. If a man in a company of men enjoys telling or listening to smut, the original

1 [So in the German.]

situation, which owing to social inhibitions cannot be realized, is at the same time imagined. A person who laughs at smut that he hears is laughing as though he were the spectator of an act of sexual aggression.

The sexual material which forms the content of smut includes more than what is *peculiar* to each sex; it also includes what is *common* to both sexes and to which the feeling of shame extends – that is to say, what is excremental in the most comprehensive sense. This is, however, [98] the sense covered by sexuality in childhood, an age at which there is, as it were, a cloaca within which what is sexual and what is excremental are barely or not at all distinguished.[1] Throughout the whole range of the psychology of the neuroses, what is sexual includes what is excremental, and is understood in the old, infantile, sense.

Smut is like an exposure of the sexually different person to whom it is directed. By the utterance of the obscene words it compels the person who is assailed to imagine the part of the body or the procedure in question and shows her that the assailant is himself imagining it. It cannot be doubted that the desire to see what is sexual exposed is the original motive of smut.

It can only help to clarify things if at this point we go back to fundamental facts. A desire to see the organs peculiar to each sex exposed is one of the original components of our libido. It may itself be a substitute for something earlier and go back to a hypothetical primary desire to touch the sexual parts. As so often, looking has replaced touching.[2] The libido for looking and touching is present in everyone in two forms, active and passive, male and female; and, according to the preponderance of the sexual character, one form or the other predominates. It is easy to observe the inclination to self-exposure in young children. In cases in which the germ of this inclination escapes its usual fate of being buried and suppressed, it develops in men into the familiar perversion known as exhibitionism. In women the inclination to passive exhibitionism is almost invariably buried under the imposing reactive function of sexual modesty, but not without a loophole being left for it in relation to clothes. I need only hint at the elasticity and variability in the amount of exhibitionism that women are permitted to retain in accordance with differing convention and circumstances.

In men a high degree of this trend persists as a portion of their libido, and it serves to introduce the sexual act. When this urge makes itself felt

1 See my *Three Essays on the Theory of Sexuality* (1905*d*), which is appearing at the same time as the present work.

2 Cf. Moll's drive of 'contrectation' (Moll, 1898). [An explanatory note on this can be found in Freud's *Three Essays* (1905*d*), *RSE*, **7**, 151 *n.*]

at the first approach to a woman, it must make use of words, for two reasons; firstly, to announce itself to her, and secondly, because if the [99]
idea [*Vorstellung*][T] is aroused by speech it may induce a corresponding excitement [*Erregung*][T] in the woman herself and may awaken an inclination in her to passive exhibitionism. A wooing speech like this is not yet smut, but it passes over into it. If the woman's readiness emerges quickly the obscene speech has a short life; it yields at once to a sexual action. It is otherwise if quick readiness on the woman's part is not to be counted on, and if in place of it defensive reactions [*Abwehrreaktionen*][T] appear. *Abwehr*
In that case the sexually exciting speech becomes an aim in itself in the shape of smut. Since the sexual aggressiveness is held up in its advance towards the act, it pauses at the evocation of the excitement and derives pleasure from the signs of it in the woman. In so doing, the aggressiveness is no doubt altering its character as well, just as any libidinal impulse [*Regung*] will if it is met by an obstacle. It becomes positively hostile and cruel, and it thus summons to its help against the obstacle the sadistic components of the sexual drive [*Geschlechtstriebes*][T]. *Geschlecht*

The woman's inflexibility is therefore the first condition for the development of smut, although, to be sure, it seems merely to imply a postponement and does not indicate that further efforts will be in vain. The ideal case of a resistance of this kind on the woman's part occurs if another man is present at the same time – a third person – for in that case an immediate surrender by the woman is as good as out of the question. This third person soon acquires the greatest importance in the development of the smut; to begin with, however, the presence of the woman is not to be overlooked. Among country people or in inns of the humbler sort it will be noticed that it is not until the entrance of the bar-maid or the innkeeper's wife that smuttiness starts up. Only at higher social levels is the opposite found, and the presence of a woman brings the smut to an end. The men save up this kind of entertainment, which originally presupposed the presence of a woman who was feeling ashamed, till they are 'alone together'. So that gradually, in place of the woman, the onlooker, now the listener, becomes the person to whom the smut is addressed, and owing to this transformation it is already near to assuming the character of a joke.

From this point onwards our attention will be drawn to two factors: the part played by the third person, the listener, and the conditions governing the subject matter of the smut itself.

Generally speaking, a tendentious joke calls for three people: in addition to the one who makes the joke, there must be a second who is taken [100]

as the object of the hostile or sexual aggressiveness, and a third in whom the joke's aim of producing pleasure is fulfilled. We shall have later to examine the deeper reasons for this state of things; for the moment let us keep to the fact to which this testifies – namely that it is not the person who makes the joke who laughs at it and who therefore enjoys its pleasurable effect, but the inactive listener. In the case of smut the three people are in the same relation. The course of events may be thus described. When the first person finds his libidinal impulse inhibited by the woman, he develops a hostile trend against that second person and calls on the originally interfering third person as his ally. Through the first person's smutty speech the woman is exposed before the third, who, as listener, has now been bribed by the effortless satisfaction of his own libido.

It is remarkable how universally popular a smutty interchange of this kind is among the common people and how it unfailingly produces a cheerful mood. But it also deserves to be noticed that in this complicated procedure, which involves so many of the characteristics of tendentious jokes, none of the formal requirements which characterize jokes is made of the smut itself. The uttering of an undisguised indecency gives the first person enjoyment and makes the third person laugh.

Only when we rise to a society of a more refined education do the formal conditions for jokes play a part. The smut becomes a joke and is tolerated only when it has the character of a joke. The technical method which it usually employs is the allusion – that is, replacement by something small, something remotely connected, which the hearer reconstructs in his imagination into a complete and straightforward obscenity. The greater the discrepancy between what is given directly in the form of smut and what it necessarily calls up in the hearer, the more refined becomes the joke and the higher, too, it may venture to climb into good society. As can easily be shown from examples, smut which has the characteristics of a joke has at its disposal, apart from allusion, whether coarse or refined, all the other methods of verbal and conceptual jokes.

[101] And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of a drive (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased

with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.

The power which makes it difficult or impossible for women, and to a lesser degree for men as well, to enjoy undisguised obscenity is termed by us 'repression' [*Verdrängung*][T]; and we recognize in it the same psychical process which, in cases of serious illness, keeps whole complexes of impulses, together with their derivatives, away from consciousness, and which has turned out to be the main factor in the causation of what are known as psychoneuroses. It is our belief that civilization [*Kultur*] and higher education [*Erziehung*][T] have a large influence in the development [*Ausbildung*] of repression, and we suppose that, under such conditions, the psychical organization undergoes an alteration (that can also emerge as an inherited disposition) as a result of which what was formerly felt as agreeable now seems unacceptable and is rejected with all possible psychical force. The repressive activity of civilization brings it about that primary possibilities of enjoyment, which have now, however, been repudiated by the censorship in us, are lost to us. But to the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost. When we laugh at a refined obscene joke, we are laughing at the same thing that makes a peasant laugh at a coarse piece of smut. In both cases the pleasure springs from the same source. We, however, could never bring ourselves to laugh at the coarse smut; we should feel ashamed or it would seem to us disgusting. We can only laugh when a joke has come to our help.

Thus what we suspected to begin with [p. 85 above] seems to be confirmed: namely that tendentious jokes have sources of pleasure at their disposal besides those open to innocent jokes, in which all the pleasure is in some way linked to their technique. And we may also once more repeat that with tendentious jokes we are not in a position to distinguish by our feeling what part of the pleasure arises from the sources of their technique and what part from those of their purpose. Thus, strictly speaking, we do not know what we are laughing at.[1] With all obscene jokes we are subject to glaring errors of judgement about the 'goodness' of jokes so far as this depends on formal determinants; the technique of [102]

1 [In all the editions before 1925 this sentence was italicized.]

such jokes is often quite wretched, but they have immense success in provoking laughter.

[3]

We will now examine the question of whether jokes play the same part in the service of a *hostile* purpose.

Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. Insofar as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us – by its consistent 'tout comprendre c'est tout pardonner' – of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with
[103] a powerful inherited disposition to hostility, we are later taught by a higher personal civilization [*Kultur*] that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds – held back by the passionless third person, in whose interest it is that personal security shall be preserved – we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him – to which the third person, who has made no efforts, bears witness by his laughter.

We are now prepared to realize the part played by jokes in hostile aggressiveness. A joke will allow us to exploit something ridiculous in

our enemy which we could not, on account of obstacles in the way, bring forward openly or consciously; once again, then, the joke *will evade restrictions and open sources of pleasure that have become inaccessible*. It will further bribe the hearer with its yield of pleasure into taking sides with us without any very close investigation, just as on other occasions we ourselves have often been bribed by an innocent joke into overestimating the substance of a statement expressed jokingly. This is brought out with perfect aptitude in the common phrase '*die Lacher auf seine Seite ziehen*' [to bring the laughers over to our side].

Let us, for instance, consider Herr N.'s jokes, which were scattered over the last chapter. They are all of them pieces of invective. It is as though Herr N. wanted to exclaim aloud: 'The Minister for Agriculture is himself an ox! [p. 24 above.]' 'Don't talk to me about * * *! He's bursting with vanity! [p. 23.]' 'I've never in my life read anything more boring than this historian's essays on Napoleon in Austria! [p. 20 f.]' But the high position he occupies makes it impossible for him to give out his judgements in that form. They therefore bring in a joke to their help, and this guarantees them a reception with the hearer which they would never have found in a non-joking form, in spite of the truth they might contain. One of these jokes is particularly instructive – the one about the 'red *Fadian*' [p. 20 f.], perhaps the most impressive of all of them. What is [104] there about it that makes us laugh and diverts our interest so completely from the question of whether or not an injustice has been done to the poor author? The joking form, of course – that is to say, the joke; but what is there about it that we are laughing at? No doubt at the person himself, who is introduced to us as the 'red *Fadian*', and in particular at his having red hair. Educated people have broken themselves of the habit of laughing at physical defects, and moreover they do not include having red hair among the laughable physical failings. But there is no doubt that it is so regarded by schoolboys and the common people – and this is still true even at the level of education of certain municipal and parliamentary representatives. And now Herr N. has made it possible in the most ingenious manner for us, grown-up and sensitive people, to laugh like the schoolboys at the historian X's red hair. This was certainly not Herr N.'s intention; but it is most doubtful whether a person who gives free play to a joke must necessarily know its precise intention.

If in these cases the obstacle to the aggressiveness which the joke helped to evade was an internal one – an aesthetic objection to the invective – elsewhere it can be of a purely external sort. This was so in the case in which Serenissimus asked a stranger by whose similarity to his

own person he had been struck: 'Was your mother in the palace at one time?' and the repartee was: 'No, but my father was.' [p. 60.] The person to whom the question was put would no doubt have liked to knock down the impertinent individual who dared by such an allusion to cast a slur on his beloved mother's memory. But the impertinent individual was Serenissimus, whom one may not knock down or even insult unless one is prepared to purchase that revenge at the price of one's whole existence. The insult must therefore, it would seem, be swallowed in silence. But fortunately a joke shows the way in which the insult may be safely avenged – by making use of the technical method of unification in order to take up the allusion and turn it back against the aggressor. Here the impression of a joke is so much determined by its purpose that, in face of the joking character of the rejoinder, we are inclined to forget that the question asked by the aggressor had itself the character of a joke with the technique of allusion.

[105] The prevention of invective or of insulting rejoinders by external circumstances is such a common case that tendentious jokes are especially favoured in order to make aggressiveness or criticism possible against persons in exalted positions who claim to exercise authority. The joke then represents a rebellion against that authority, a liberation from its pressure. The charm of caricatures lies in this same factor: we laugh at them even if they are unsuccessful simply because we count rebellion against authority as a merit.

If we bear in mind the fact that tendentious jokes are so highly suitable for attacks on the great, the dignified and the mighty, who are protected by internal inhibitions and external circumstances from direct disparagement, we shall be obliged to take a special view of certain groups of jokes which seem to be concerned with inferior and powerless people. I am thinking of the anecdotes about marriage brokers, some of which we became acquainted with in the course of our investigation of the various techniques of conceptual jokes. In a few of them, for instance in the examples 'She's deaf as well' [p. 56 f.] and 'Who would lend these people anything?' [p. 57], the broker is laughed at for his improvidence and thoughtlessness and he becomes comic because the truth escapes him as it were automatically. But does what we have learnt of the nature of tendentious jokes on the one hand and on the other hand our great enjoyment of these stories fit in with the paltriness of the people whom these jokes seem to laugh at? Are they worthy opponents of the jokes? Is it not rather the case that the jokes only put forward the marriage brokers in order to strike at something more important? Is it

not a case of saying one thing and meaning another? It is really not possible to reject this view.

This interpretation of the broker anecdotes may be carried further. It is true that there is no *necessity* for my entering into them, that I can content myself with regarding these anecdotes as '*Schwänke*' [funny stories] and deny that they have the character of a joke. Thus jokes can also have a subjective determinant of this kind. Our attention has now been drawn to that possibility and we shall have to examine it later [Chapter V]. It declares that only what I allow to be a joke *is* a joke. What is a joke to me may be merely a comic story to other people. But if a joke admits of this doubt, the reason can only be that it has a façade – in these [106]
instances a comic one – in the contemplation of which one person is satiated while another may try to peer behind it. A suspicion may arise, moreover, that this façade is intended to dazzle the examining eye and that these stories have therefore something to conceal.

In any case, if our marriage-broker anecdotes are jokes, they are all the better jokes because, thanks to their façade, they are in a position to conceal not only what they have to say but also the fact that they have something – forbidden – to say. The continuation of this interpretation – and this uncovers the hidden meaning and reveals these anecdotes with a comic façade as tendentious jokes – would be as follows. Anyone who has allowed the truth to slip out in an unguarded moment is in fact glad to be free of pretence. This is a correct and profound piece of psychological insight. Without this internal agreement no-one lets himself be mastered by the automatism which in these cases brings the truth to light.[1] But this converts the laughable figure of the *Schadchen* into a sympathetic one, deserving of pity. How happy the man must be to be able at last to throw off the burden of pretence, since he makes use of the first chance of shouting out the very last scrap of truth! As soon as he sees that the case is lost, that the bride does not please the young man, he gladly betrays yet another concealed defect which has escaped notice, or he takes the opportunity of producing an argument that settles a detail in order to express his contempt for the people he is working for: 'I ask you – who would lend these people anything?' The whole of the ridicule in the anecdote now falls upon the parents, barely touched on in it, who think this swindle justified in order to get their daughter a husband, upon the pitiable position of girls who let themselves be married on such terms, and upon the disgracefulness of marriages contracted on such a

1 This is the same mechanism that governs slips of the tongue and other phenomena of self-betrayal. See *The Psychopathology of Everyday Life* (1901*b*) [e.g. Chapter V; *RSE*, **6**, 46].

basis. The marriage broker is the right man to express such criticisms, for he knows most about these abuses; but he must not say them aloud, for he is a poor man whose existence depends on exploiting them. The popular mind, which created these stories, and others like them, is torn
[107] by a similar conflict; for it knows that the sacredness of marriages after they have been contracted is grievously affected by the thought of what happened at the time when they were arranged.

Let us recall, too, what we observed while we were investigating the technique of jokes: that in jokes nonsense often replaces ridicule and criticism in the thoughts lying behind the joke [p. 51 f. above]. (In this respect, incidentally, the joke-work is doing the same thing as the dream-work.) Here we find the fact confirmed once again. That the ridicule and criticism are not directed against the figure of the broker, who only appears in the examples we have quoted as a whipping-boy, is shown by another class of jokes in which the marriage broker is represented, on the contrary, as a superior person, whose dialectical powers prove sufficient to meet any difficulty. They are anecdotes with a logical instead of a comic façade – sophistical conceptual jokes. In one of them (p. 55) the broker succeeds in arguing away the bride's defect of being lame. It is at least a '*fait accompli*'; another wife, with straight limbs, would on the contrary be in constant danger of falling down and breaking her leg, and this would be followed by illness, pains and the expenses of treatment, all of which would be spared in the case of the woman who is lame already. Or there is another anecdote [p. 54], in which he succeeds in repelling a whole series of complaints made by the suitor against the bride, meeting each one with good arguments till he replies to the last, which cannot be countered: 'What *do* you want? Isn't she to have a single fault?', as though there were not necessarily something left over from the earlier objections. There is no difficulty in showing the weak spot in the argument in these two examples, and we did so in examining their technique. But what interests us now is something different. If the broker's speech is given such a marked appearance of logic which, on careful examination, is recognizable as being only an appearance, the truth behind it is that the joke declares the broker to be in the right; the thought does not venture to do so seriously but replaces the seriousness with the appearance which the joke presents. But here, as so often, a jest betrays something serious. We shall not be mistaken if we assume of all these anecdotes with a logical façade that they really mean what they assert for reasons that are intentionally faulty. It is only this employment
[108] of sophistry for the disguised representation of the truth that gives it the

character of a joke, which is thus essentially dependent on its purpose. For what is hinted at in the two anecdotes is that it is really the suitor who is making himself ridiculous when he collects the bride's different advantages together with so much care, though all of them are weak, and when, in doing so, he forgets that he must be prepared to take as his wife a human being with her inevitable defects; while, on the other hand, the one characteristic that would make marriage with the woman's more or less imperfect personality tolerable – mutual attraction and readiness for affectionate adaptation – is quite left out of account in the whole transaction.

The mockery directed at the suitor in these examples, in which the broker quite appropriately plays the part of a superior, is expressed much more plainly in other anecdotes. The plainer these stories are, the less joke technique do they contain; they are, as it were, only marginal cases of jokes, with the technique of which they no longer have anything in common but the construction of a façade. But owing to their having the same purpose and to its being concealed behind the façade, they produce the complete effect of a joke. Moreover, the poverty of their technical methods explains how it is that many of these jokes cannot, without suffering damage, dispense with the element of dialect, which has an effect similar to the joke technique.

A story of this sort, which, while possessing all the force of a tendentious joke, exhibits nothing of its technique, is the following: 'The marriage broker asked: "What do you require of your bride?" – Answer: "She must be beautiful, she must be rich, and educated." – "Very good", said the broker, "but I count that as making three matches."' Here the rebuke to the man is delivered openly, and is no longer clothed as a joke.

In the examples we have considered hitherto, the disguised aggressiveness has been directed against *people* – in the broker jokes against everyone involved in the business of arranging a marriage: the bride and bridegroom and their parents. But the object of the joke's attack may equally well be institutions, people in their capacity as vehicles of institutions, dogmas of morality or religion, views of life which enjoy so much respect that objections to them can only be made under the mask of a joke and indeed of a joke concealed by its façade. Though the themes at [109]
which these tendentious jokes are aimed may be few, their forms and envelopes are very many and various. I think we shall do well to distinguish this class of tendentious joke by a special name. The appropriate name will emerge after we have interpreted a few examples of the class.

I may recall the two stories – one of the impoverished gourmet who

was caught eating 'salmon mayonnaise' [p. 44 above] and the other of the dipsomaniac tutor [p. 46] – which we learnt to know as sophistical displacement jokes. I will now continue their interpretation. We have since heard that if an appearance of logic is tacked on to the façade of a story the thought would like to say seriously 'the man is right', but, owing to an opposing contradiction, does not venture to declare the man right except on a single point, on which it can easily be shown that he is *wrong*. The 'point' chosen is the correct compromise between his rightness and his wrongness; this, indeed, is no decision, but corresponds to the conflict within ourselves. The two anecdotes are simply epicurean. They say: 'Yes. The man is right. There is nothing higher than enjoyment and it is more or less a matter of indifference how one obtains it.' This sounds shockingly immoral and is no doubt not much better. But at bottom it is nothing other than the poet's '*Carpe diem*',[1] which appeals to the uncertainty of life and the unfruitfulness of virtuous renunciation. If the idea that the man in the 'salmon mayonnaise' joke was right has such a repellent effect on us, this is only because the truth is illustrated by an enjoyment of the lowest kind, which it seems to us we could easily do without. In reality each of us has had hours and times at which he has admitted the rightness of this philosophy of life and has reproached moral doctrine with only understanding how to demand without offering any compensation. Since we have ceased any longer to believe in the promise of a next world in which every renunciation will be rewarded by a satisfaction – there are, incidentally, very few pious people if we take renunciation as the sign of faith – '*Carpe diem*' has become a serious warning. I will gladly put off satisfaction: but do I know whether I shall still be here tomorrow? '*Di doman' non c'è certezza*.'[2]

[110] I will gladly renounce all the methods of satisfaction proscribed by society, but am I certain that society will reward this renunciation by offering me one of the permitted methods – even after a certain amount of postponement? What these jokes whisper may be said aloud: that the wishes and desires of men have a right to make themselves acceptable alongside of exacting and ruthless morality. And in our days it has been said in forceful and stirring sentences that this morality is only a selfish regulation laid down by the few who are rich and powerful and who can satisfy their wishes at any time without any postponement. So long as the art of healing has not gone further in making our life safe

1 [Horace, *Odes*, I, xi, 8.]

2 Lorenzo de' Medici [(1449–92): 'There is no certainty about tomorrow.' From *Il Trionfo di Bacco e di Arianna*].

and so long as social arrangements do no more to make it more enjoyable, so long will it be impossible to stifle the voice within us that rebels against the demands of morality. Every honest man will end by making this admission, at least to himself. The decision in this conflict can only be reached by the roundabout path of fresh insight. One must bind one's own life to that of others so closely and be able to identify oneself with others so intimately that the brevity of one's own life can be overcome; and one must not fulfil the demands of one's own needs illegitimately, but must leave them unfulfilled, because only the continuance of so many unfulfilled demands can develop the power to change the order of society. But not every personal need can be postponed in this way and transferred to other people, and there is no general and final solution to the conflict.

We now know the name that must be given to jokes like those that we have last interpreted. They are *cynical* jokes and what they disguise are cynicisms.

Among the institutions which cynical jokes are in the habit of attacking none is more important or more strictly guarded by moral regulations but at the same time more inviting to attack than the institution of marriage, at which, accordingly, the majority of cynical jokes are aimed. There is no more personal claim than that for sexual freedom and at no point has civilization tried to exercise severer suppression than in the sphere of sexuality. A single example will be enough for our purposes – the one mentioned on p. 69, 'An Entry in Prince Carnival's Album':

'A wife is like an umbrella – sooner or later one takes a cab.'

We have already discussed the complicated technique of this example: [111]
a bewildering and apparently impossible simile, which, however, as we now see, is not in itself a joke; further, an allusion (a cab is a public vehicle); and, as its most powerful technical method, an omission which increases the unintelligibility. The simile may be worked out as follows. One marries in order to protect oneself against the temptations of sensuality, but it turns out nevertheless that marriage does not allow of the satisfaction of needs that are somewhat stronger than usual. In just the same way, one takes an umbrella with one to protect oneself from the rain and nevertheless gets wet in the rain. In both cases one must look around for a stronger protection: in the latter case one must take a public vehicle, and in the former a woman who is accessible in return for money. The joke has now been almost entirely replaced by a piece of cynicism. One does not venture to declare aloud and openly that marriage is not an

arrangement calculated to satisfy a man's sexuality, unless one is driven to do so perhaps by the love of truth and eagerness for reform of a Christian von Ehrenfels.[1] The strength of this joke lies in the fact that nevertheless – in all kinds of roundabout ways – it *has* declared it.

A particularly favourable occasion for tendentious jokes is presented when the intended rebellious criticism is directed against the subject himself, or, to put it more cautiously, against someone in whom the subject has a share – a collective person, that is (the subject's own nation, for instance). The occurrence of self-criticism as a determinant may explain how it is that a number of the most apt jokes (of which we have given plenty of instances) have grown up on the soil of Jewish popular life. They are stories created by Jews and directed against Jewish characteristics. The jokes made about Jews by foreigners are for the most part brutal comic stories in which a joke is made unnecessary by the fact that Jews are regarded by foreigners as comic figures. The Jewish jokes which originate from Jews admit this too; but they know their real faults as well as the connection between them and their good qualities, and the share
[112] which the subject has in the person found fault with creates the subjective determinant (usually so hard to arrive at) of the joke-work. [Cf. p. 122 ff. below.] Incidentally, I do not know whether there are many other instances of a people making fun to such a degree of its own character.

As an example of this I may take the anecdote, quoted on p. 70 f., of a Jew on a railway train promptly abandoning all decent behaviour when he discovered that the newcomer into his compartment was a fellow believer. We made the acquaintance of this anecdote as evidence of something being demonstrated by a detail, of representation by something very small. It is meant to portray the democratic mode of thinking of Jews, which recognizes no distinction between lords and serfs, but also, alas, upsets discipline and cooperation.

Another, especially interesting group of jokes portrays the relation of poor and rich Jews to one another. Their heroes are the '*Schnorrer*'[2] and the charitable householder or the baron.

'A *Schnorrer*, who was allowed as a guest into the same house every Sunday, appeared one day in the company of an unknown young man who gave signs of being about to sit down to table. "Who is this?" asked

1 See his essays (1903). [A later work of his was the starting point of Freud's paper on "'Civilized" Sexual Morality and Modern Nervous Illness' (1908*d*), *RSE*, **9**, 159 ff. In that paper Freud himself embarked on some severe criticisms of the institution of marriage. See also Freud's Statement on Marriage Law Reform (1905*g*), ibid., **7**, 305 ff.]

2 [Beggar or scrounger.]

the householder. "He's been my son-in-law", was the reply, "since last week. I've promised him his board for the first year.'"

The purpose of these stories is always the same; it emerges most clearly in the next one:

'The *Schnorrer* begged the baron for some money for a journey to Ostend; his doctor had recommended sea-bathing for his troubles. The baron thought Ostend was a particularly expensive resort; a cheaper one would do equally well. The *Schnorrer*, however, rejected the proposal with the words: "Herr Baron, I consider nothing too expensive for my health.'" This is an excellent displacement joke which we might have taken as a model for that class.[1] The baron evidently wants to save his money, but the *Schnorrer* answers as though the baron's money was his own, which he may then quite well value less than his health. Here we are expected to laugh at the impertinence of the demand; but it is rarely [113]
that these jokes are not equipped with a façade to mislead the understanding. The truth that lies behind is that the *Schnorrer*, who in his thoughts treats the rich man's money as his own, has actually, according to the sacred ordinances of the Jews, almost a right to make this confusion. The indignation raised by this joke is of course directed against a law which is highly oppressive even to pious people.

Here is another anecdote:

'A *Schnorrer* on his way up a rich man's staircase met a fellow member of his profession, who advised him to go no further. "Don't go up today," he said, "the baron is in a bad mood today; he's giving nobody more than one florin." – "I'll go up all the same", said the first *Schnorrer*. "Why should I give him a florin? Does he give *me* anything?'"

This joke employs the technique of absurdity, since it makes the *Schnorrer* assert that the baron gives him nothing at the very moment at which he is preparing to beg him for a gift. But the absurdity is only apparent. It is almost true that the rich man gives him nothing, since he is obliged by the law to give him alms and should, strictly speaking, be grateful to him for giving him an opportunity for beneficence. The ordinary, middle-class view of charity is in conflict here with the religious one; it is in open rebellion against the religious one in the other story, of the baron who, deeply moved by a *Schnorrer's* tale of woe, rang for his servants: 'Throw him out! he's breaking my heart!' This open revelation of its purpose constitutes once more a marginal case of a joke. It is only

1 [This joke has in fact already appeared as an example of a displacement joke (see p. 49 above). Freud may perhaps, as an afterthought, have added it to the earlier chapter and then omitted to make the necessary change in the present passage.]

in the fact that they present the matter as applied to individual cases that these last stories differ from a complaint which is no longer a joke: 'There is really no advantage in being a rich man if one is a Jew. Other people's misery makes it impossible to enjoy one's own happiness.'

Other stories, which are once again technically borderline cases of jokes, give evidence of a profoundly pessimistic cynicism. For instance:

'A man who was hard of hearing consulted the doctor, who correctly diagnosed that the patient probably drank too much brandy and was on that account deaf. He advised him against it and the deaf man promised to take his advice to heart. After a while the doctor met him in the [114] street and asked him in a loud voice how he was. "Thank you", was the answer. "You needn't shout so loud, doctor. I've given up drinking and hear quite well again." A little while later they met once more. The doctor asked him how he was in his ordinary voice, but noticed that his question had not been understood. "Eh? What was that?" – "It seems to me you're drinking brandy again", shouted the doctor in his ear, "and that's why you're deaf again." "You may be right," replied the deaf man, "I *have* begun drinking brandy again and I'll tell you why. So long as I didn't drink I was able to hear. But nothing I heard was as good as the brandy."' Technically this joke is nothing other than an object lesson: dialect or skill in narrative are necessary for raising a laugh, but in the background lies the sad question: may not the man have been right in his choice?

It is on account of the allusion made by these pessimistic stories to the manifold and hopeless miseries of the Jews that I must class them with tendentious jokes.

Other jokes, which are in the same sense cynical and which are not only Jewish anecdotes, attack religious dogmas and even the belief in God. The story of the Rabbi's '*Kück*' [p. 55 f. above], the technique of which lay in the faulty thinking which equated phantasy and reality (another possible view was to regard it as a displacement), is a cynical or critical joke of this kind, directed against miracle-workers and certainly against the belief in miracles as well. Heine is said to have made a definitely blasphemous joke on his deathbed. When a friendly priest reminded him of God's mercy and gave him hope that God would forgive him his sins, he is said to have replied: 'Bien sûr qu'il me pardonnera: c'est son métier.'[1] This is a disparaging comparison (technically perhaps only having the value of an allusion), since a '*métier*', a trade or profession, is what a workman or a doctor has – and he has only a single *métier*.

1 ['Of course he'll forgive me: that's his job.']

But the force of the joke lies in its purpose. What it means to say is nothing else than: 'Of course he'll forgive me. That's what he's there for, and that's the only reason I've taken him on (as one engages one's doctor or one's lawyer).' So in the dying man, as he lay there powerless, a consciousness stirred that he had created God and equipped him with power so as to make use of him when the occasion arose. What was supposed to [115] be the created being revealed itself just before its annihilation as the creator.

[4]

To the classes of tendentious jokes that we have considered so far –
exposing or obscene jokes,
aggressive (hostile) jokes,
cynical (critical, blasphemous) jokes –
I should like to add another, the fourth and rarest, the nature of which can be illustrated by a good example:

'Two Jews met in a railway carriage at a station in Galicia. "Where are you going?" asked one. "To Cracow", was the answer. "What a liar you are!" broke out the other. "If you say you're going to Cracow, you want me to believe you're going to Lemberg. But I know that in fact you're going to Cracow. So why are you lying to me?"'

This excellent story, which gives an impression of over-subtlety, evidently works by the technique of absurdity. The second Jew is reproached for lying because he says he is going to Cracow, which is in fact his destination! But the powerful technical method of absurdity is here linked with another technique, representation by the opposite, for, according to the uncontradicted assertion of the first Jew, the second is lying when he tells the truth and is telling the truth by means of a lie. But the more serious substance of the joke is the problem of what determines the truth. The joke, once again, is pointing to a problem and is making use of the uncertainty of one of our commonest concepts. Is it the truth if we describe things as they are without troubling to consider how our hearer will understand what we say? Or is this only Jesuitical truth, and does not genuine truth consist in taking the hearer into account and giving him a faithful picture of our own knowledge? I think that jokes of this kind are sufficiently different from the rest to be given a special position. What they are attacking is not a person or an institution but the certainty of our knowledge itself, one of our speculative possessions. The appropriate name for them would therefore be 'sceptical' jokes.

[5]

[116] In the course of our discussion of the purposes of jokes we have perhaps thrown light on a number of questions and have certainly come upon plenty of suggestions for further enquiries. But the findings of this chapter combine with those of the last one to present us with a difficult problem. If it is correct to say that the pleasure provided by jokes depends on the one hand on their technique and on the other hand on their purpose, from what common point of view can such different sources of the pleasure in jokes be brought together?

B. SYNTHETIC PART

IV
THE MECHANISM OF PLEASURE AND THE PSYCHOGENESIS OF JOKES

[1]

We can now start out from an assured knowledge of the sources of the peculiar pleasure given us by jokes. We are aware that we may be deceived into confusing our enjoyment of the intellectual content of what is stated with the pleasure proper to jokes; but we know that that pleasure itself has at bottom two sources – the technique and the purposes of jokes. What we now want to discover is the way in which the pleasure arises from these sources, the mechanism of the pleasurable effect. [117]

We shall, I think, find the explanation we are in search of far easier from tendentious jokes than from innocent ones. We will therefore begin with the former.

The pleasure in the case of a tendentious joke arises from a purpose being satisfied whose satisfaction would otherwise not have taken place. That a satisfaction such as this is a source of pleasure calls for no further remark. But the manner in which a joke leads to this satisfaction is linked with particular conditions, from which we may perhaps arrive at some further information. Two cases are to be distinguished here. The simpler one is where the satisfaction of the purpose is opposed by an external obstacle which is evaded by the joke. We found this, for instance, in the reply received by Serenissimus to his question of whether the mother of the man he was speaking to had ever lived in the palace [p. 60 above] and in the critic's rejoinder to the two rich rascals who showed him their portraits: 'But where's the Saviour?' [p. 65 f.] In the former case the purpose was to answer one insult with another, and in the latter it was to hand across an insult instead of the assessment that had been asked for. What opposed the purpose were purely external factors – the

powerful position of the people at whom the insults were directed. It
[118] may nevertheless strike us that, however much these and analogous jokes of a tendentious nature may satisfy us, they are not able to provoke much laughter.

It is otherwise when what stands in the way of the direct realization of the purpose is not an external factor but an internal obstacle, when an internal impulse opposes the purpose. This condition would seem, on our hypothesis, to be fulfilled in the jokes of Herr N., in whom a strong inclination to invective is held in check by a highly developed aesthetic culture. By the help of a joke, this internal resistance is overcome in the particular case and the inhibition lifted. By that means, as in the instance of the external obstacle, the satisfaction of the purpose is made possible and its suppression, together with the 'psychical damming up'[1] that this would involve, is avoided. To that extent the mechanism of the generation of pleasure would be the same in the two cases.

Nevertheless, we are inclined here to go more deeply into the distinctions between the psychological situation in the cases of an external and an internal obstacle, for we have a suspicion that the removal of an internal obstacle may make an incomparably higher contribution to the pleasure. But I suggest that at this point we should exercise moderation and be satisfied for the moment with establishing what remains the essential point for us. The cases of an external and an internal obstacle differ only in the fact that[t] in the latter an already existing inhibition is lifted and that in the former the erection of a new one is avoided. That being so, we shall not be relying too much on speculation if we assert that both for erecting and for maintaining a psychical inhibition some 'psychical expenditure'[2] is required. And, since we know that in both cases of the use of tendentious jokes pleasure is obtained, it is therefore plausible to suppose that *this yield of pleasure corresponds to the psychical expenditure that is saved*.

Here then we have once more come upon the principle of economy which we met first in discussing the technique of verbal jokes [p. 37 ff. above]. But whereas in the earlier case we seemed to find the economy in the use of as few words as possible or of words as much alike as possible, we now have a suspicion of an economy in the far more comprehensive
[119] sense of psychical expenditure in general; and we must regard it as possible that a closer understanding of what is still the very obscure concept of 'psychical expenditure' may bring us nearer to the essential nature of jokes.

1 [The phrase is from Lipps (1898, 72, etc.). See below, p. 134.]

2 [I.e. expenditure of psychical energy (p. 128 ff.).]

A certain lack of clarity which we have been unable to overcome in our handling of the mechanism of pleasure in tendentious jokes may be taken as an appropriate punishment for our having tried to clear up the more complex problem before the simpler one, tendentious jokes before innocent ones. We take note of the fact that '*economy in expenditure on inhibition or suppression*' appears to be the secret of the pleasurable effect of tendentious jokes, and pass on to the mechanism of pleasure in innocent jokes.

On the basis of suitable specimens of innocent jokes, in which there was no fear of our judgement being disturbed by their content or purpose, we were driven to conclude that the techniques of jokes are themselves sources of pleasure; and we shall now try to discover whether it may perhaps be possible to trace that pleasure back to economy in psychical expenditure. In one group of these jokes (play upon words) the technique consisted in focusing our psychical attitude upon the *sound* of the word instead of upon its *meaning* – in making the (acoustic) word presentation [*Wortvorstellung*][T] itself take the place of its denotation as given by its relations to thing presentations [*Dingvorstellungen*].[1] It may really be suspected that in doing so we are bringing about a great relief in psychical work and that when we make serious use of words we are obliged to hold ourselves back with a certain effort from this comfortable procedure. We can observe how pathological states of thought activity, in which the possibility of concentrating psychical expenditure on a particular point is probably restricted, do in fact give this sort of [120]
sound presentation of the word greater prominence than its meaning, and that sufferers in such states proceed in their speech on the lines (as the formula runs) of the 'external' instead of the 'internal' associations of the word presentation. We notice, too, that children, who, as we know, are in the habit of still treating words as things,[2] tend to expect words that are the same or similar to have the same meaning behind them – which is a source of many mistakes that are laughed at by grown-up people. If, therefore, we derive unmistakable enjoyment in

1 [It was not until ten years later, in his metapsychological papers, that Freud dealt at greater length with the fact that 'the conscious presentation of the object can now be split up into the presentation of the *word* and the presentation of the *thing*', and enlarged on the importance of the distinction from the standpoint of psychopathology, as is indicated in the present passage. See in particular Section VII of the paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 177 ff. His interest in the question, however, goes back much earlier – to the time of his monograph on aphasia (1891*b*; *NSW*, **4**, Chapter VI). An extract from that work dealing with the subject can be found printed as an Appendix to 'The Unconscious', *RSE*, **14**, 186 ff.]

2 [Cf. a passage in Chapter VI, Section A, of *The Interpretation of Dreams* (1900*a*), ibid., **4**, 270. An example of this phenomenon is given in the 'Little Hans' case history (1909*b*), ibid., **10**, 45–6 *n*. 4.]

jokes from being transported by the use of the same or a similar word from one circle of ideas to another, remote one (in the 'Home-Roulard', for instance [p. 83 above], from the kitchen to politics), this enjoyment is no doubt correctly to be attributed to economy in psychical expenditure. The pleasure in a joke arising from a 'short-circuit' like this seems to be the greater the more alien the two circles of ideas that are brought together by the same word – the further apart they are, and thus the greater the economy which the joke's technical method provides in the train of thought. We may notice, too, that here jokes are making use of a method of linking things up which is rejected and studiously avoided by serious thought.[1]

In a second group of technical methods used in jokes – unification, similarity of sound, multiple use, modification of familiar phrases, allusions to quotations – we can single out as their common characteristic the fact that in each of them something familiar is rediscovered, where we might instead have expected something new. This rediscovery of what is familiar is pleasurable, and once more it is not difficult for us to recognize this pleasure as a pleasure in economy and to relate it to economy in psychical expenditure.

[121] It seems to be generally agreed that the rediscovery of what is familiar, 'recognition', is pleasurable. Groos (1899, 153) writes: 'Recognition is always, unless it is too much mechanized (as, for instance, in dressing, . . .), linked with feelings of pleasure. The mere quality of familiarity is easily accompanied by the quiet sense of comfort which Faust felt when, after an uncanny encounter, he entered his study once again [*Faust*, Part I, Scene 3.] . . . If the act of recognition thus gives rise

1 If I may be allowed to anticipate the exposition in the text, I can at this point throw light on the condition which seems to determine whether a joke is to be called a 'good' or a 'bad' one. If, by means of a word with two meanings or a word that is only slightly modified, I take a shortcut from one circle of ideas [*Vorstellungskreis*] to another, and if there is not at the same time a meaningful link between those circles of ideas, then I shall have made a 'bad' joke. In a bad joke like this the only existing link between the two disparate ideas is the one word – the 'point' of the joke. The example of 'Home-Roulard' quoted above is a joke of this kind. A 'good' joke, on the other hand, comes about when what children expect [see above, p. 105] proves correct and the similarity between the words is shown to be really accompanied by another, essential similarity in their sense. Such, for instance, is the example '*Traduttore – Traditore!*' [p. 30]. The two disparate ideas, which are here linked by an external association, are also united in a meaningful relation which indicates an essential kinship between them. The external association merely takes the place of the internal connection; it serves to point it out or make it clear. A 'translator' is not only called by a similar name to a 'traitor'; he actually *is* a kind of traitor and bears the name, as it were by right.

The distinction that is here developed coincides with the one which is to be introduced later [p. 113 ff.] between a 'jest' and a 'joke'. But it would be unjust to exclude examples like 'Home-Roulard' from the discussion of the nature of jokes. As soon as we take into consideration the peculiar pleasure derived from jokes, we find that the 'bad' jokes are by no means bad as jokes – that is, unsuitable for producing pleasure.

to pleasure, we might expect that men would hit on the idea of exercising this capacity for its own sake – that is, would experiment with it in play. And in fact Aristotle regarded joy in recognition as the basis of the enjoyment of art, and it cannot be disputed that this principle should not be overlooked, even if it does not possess such far-reaching significance as Aristotle attributes to it.'

Groos goes on to discuss games whose characteristic lies in the fact that they intensify the joy in recognition by putting obstacles in its way – that is to say, by creating a 'psychical damming up', which is got rid of by the act of recognition. His attempt at an explanation, however, abandons the hypothesis that recognition is pleasurable in itself, since, by referring to these games, he is tracing back the enjoyment of recognition to a joy in *power* [*Macht*][T], a joy in the overcoming of a difficulty. I regard the latter factor as secondary, and I see no reason to depart from [122]
the simpler view that recognition is pleasurable in itself – i.e. through relieving psychical expenditure – and that the games founded on this pleasure make use of the mechanism of damming up only in order to increase the amount of such pleasure.

It is also generally acknowledged that rhymes, alliterations, refrains, and other forms of repeating similar verbal sounds which occur in verse, make use of the same source of pleasure – the rediscovery of something familiar. The 'sense of power' plays no perceptible part in these techniques, which show so much similarity to that of 'multiple use' in the case of jokes.

In view of the close connection between recognizing and remembering, it is not rash to suppose that there may also be a pleasure in remembering – that the act of remembering is in itself accompanied by a feeling of pleasure of similar origin. Groos seems not to be averse to such a hypothesis, but he derives it once again from the 'sense of power', to which he attributes (wrongly, in my view) the chief reason for enjoyment in almost all games.

The 'rediscovery of what is familiar' is the basis for the use of another technical resource in jokes, which we have not yet mentioned. I refer to the factor of 'topicality', which is a fertile source of pleasure in a great many jokes and which explains a few of the peculiarities in the life history of jokes. There are jokes which are completely independent of this condition, and in a monograph on jokes we are obliged to make almost exclusive use of examples of that kind. But we cannot forget that, in comparison with these perennial jokes, we have perhaps laughed even more heartily at others which it is difficult for us to use now because they

would call for long commentaries and even with such help would not produce their original effect. These latter jokes contained allusions to people and events which at the time were 'topical', which had aroused general interest and still kept it alive. When this interest had ceased and the business in question had been settled, these jokes too lost a part of their pleasurable effect and indeed a very considerable part. For instance, the joke made by my friendly host when he called a pudding that was being served a 'Home-Roulard' [p. 83 above] does not seem to me today nearly so good as it did at the time when 'Home Rule' provided a standing headline in the political columns of our daily papers. In attempting to [123] estimate the merits of this joke I now attribute them to the fact that a single word has transported us, with the economy of a long detour in thought, from the circle of ideas of the kitchen to the remote one of politics. But at the time my account would have had to be different, and I should have said that this word transported us from the circle of ideas of the kitchen to that of politics, which was remote from it but was certain of our lively interest because we were constantly concerned with it. Another joke, 'This girl reminds me of Dreyfus; the army doesn't believe in her innocence' [p. 35], has also faded today, though its technical methods must have remained unaltered. The bewilderment caused by the comparison and the *double entendre* in the word 'innocence' cannot compensate for the fact that the allusion, which at the time touched on an *Besetzung* event cathected [*besetzte*][T] with fresh excitement, today recalls a question that is settled. Here is a joke which is still topical: 'The Crown Princess Louise approached the crematorium in Gotha with the question of how much a *Verbrennung* [cremation] costs. The management replied: "Five thousand marks normally; but we will only charge *you* three thousand as you have been *durchgebrannt* [literally 'been burnt through' – slang for 'eloped'] once already."' A joke like this sounds irresistible today; in a short time it will have sunk very considerably in our estimation; and some time later still, in spite of its good play upon words, it will lose its effect entirely, for it will be impossible to repeat it without adding a commentary to explain who Princess Louise was and the sense in which she was *durchgebrannt*.[1]

Thus a great number of the jokes in circulation have a certain lifespan: their life runs a course made up of a period of flowering and a period of decay and it ends in complete oblivion. The need which men feel for

1 [It must accordingly be explained that Princess Louise was the Crown Princess of Saxony who left her husband in 1903. For an account of the strange circumstances, see her autobiography (1911).]

deriving pleasure from their processes of thought is therefore constantly creating new jokes based on the new interests of the day. The vital force of topical jokes is not their own; it is borrowed, by the method of allusion, from those other interests, the expiry of which determines the fate of the joke as well. The factor of topicality is a source of pleasure, ephemeral it is true but particularly abundant, which supplements the sources inherent in the joke itself. It cannot be simply equated with the rediscovery of what is familiar. It is concerned rather with a particular category of what is familiar, which must in addition possess the characteristic of being fresh, recent and untouched by forgetting. In the formation of dreams, too, we come across a special preference for what is recent[1] and we cannot escape a suspicion that association with what is recent is rewarded, and so facilitated, by a peculiar bonus of pleasure. [124]

Unification, which is after all no more than repetition in the sphere of thought connections instead of in that of subject matter, was given special recognition by Fechner as a source of the pleasure in jokes. He writes (Fechner, 1897, **1**, Chapter XVII): 'In my opinion the chief part in the field we are now considering is played by the principle of the unified linking of multiplicities; it requires support, however, from auxiliary determinants in order that the enjoyment which can be derived from these cases, with its peculiar character, may be carried over the threshold.'[2]

In all these cases of repeating the same connections or the same subject matter in the words, or of rediscovering what is familiar or recent, it seems impossible to avoid deriving the pleasure felt in them from economy in psychical expenditure – provided that this line of approach turns out to be fruitful in throwing light on details and in arriving at new generalities. We are aware that we have still to make it clear how the economy comes about and what the meaning is of the expression 'psychical expenditure'.

The third group of techniques of jokes – for the most part of conceptual jokes – which comprises faulty thinking, displacements, absurdity, representation by the opposite, etc., may at first glance seem to bear a special impress and to betray no kinship with the techniques of rediscovery of what is familiar or the replacement of object associations [*Gegenstandsassoziationen*] by word associations. Nevertheless, it is particularly easy here to bring into play the theory of economy or relief in psychical expenditure. [125]

1 [See *The Interpretation of Dreams* (1900*a*), e.g. *RSE*, **4**, 159–60, and **5**, 503–4.]

2 The title of Chapter XVII is 'On significant and joking similes, play upon words and other cases which bear the character of being amusing, funny or ridiculous'.

It cannot be doubted that it is easier and more convenient to diverge from a line of thought we have embarked on than to keep to it, to jumble up things that are different rather than to contrast them – and, indeed, that it is *specially* convenient to admit as valid methods of inference that are rejected by logic and, lastly, to put words or thoughts together without regard to the condition that they ought also to make sense. This cannot be doubted; and these are precisely the things that are done by the joke techniques which we are discussing. But the hypothesis that behaviour of this kind by the joke-work provides a source of pleasure will strike us as strange, since apart from jokes all such inefficient intellectual functioning produces in us nothing but unpleasurable defensive feelings.

'Pleasure in nonsense', as we may call it for short, is concealed in serious life to a vanishing point. In order to demonstrate it we must investigate two cases – one in which it is still visible and one in which it becomes visible again: the behaviour of a child in learning, and that of an adult in a toxically altered state of mind.

During the period in which a child is learning how to handle the vocabulary of his mother tongue, it gives him obvious pleasure to 'experiment with it in play', to use Groos's words [p. 107 above]. And he puts words together without regard to the condition that they should make sense, in order to obtain from them the pleasurable effect of rhythm or rhyme. Little by little he is forbidden this enjoyment, till all that remains permitted to him are significant combinations of words. But when he is older attempts still emerge at disregarding the restrictions that have been learnt on the use of words. Words are disfigured by particular little additions being made to them, their forms are altered by certain manipulations (e.g. by reduplications or '*Zittersprache*'[1]), or a private language may even be constructed for use among playmates. These attempts are found again among certain categories of mental patients.

[126] Whatever the motive may have been which led the child to begin these games, I believe that in his later development he gives himself up to them with the consciousness that they are nonsensical, and that he finds enjoyment in the attraction of what is forbidden by reason. He now uses games in order to withdraw from the pressure of critical reason. But there is far more potency in the restrictions which must establish themselves in the course of a child's education in logical

1 [This was a particular form of secret language in which the sound 'zitter' played a part. The topic had been touched on by Freud in the passage in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 270, already referred to (p. 105 *n*. 2 above).]

thinking and in distinguishing between what is true and false in reality; and for this reason the rebellion against the compulsion of logic and reality is deep-going and long-lasting. Even the phenomena of imaginative activity must be included in this [rebellious] category. The power of criticism has increased so greatly in the later part of childhood and in the period of learning which extends over puberty that the pleasure in 'liberated nonsense' only seldom dares to show itself directly. One does not venture to say anything absurd. But the characteristic tendency of boys to do absurd or silly things seems to me to be directly derived from the pleasure in nonsense. In pathological cases we often see this tendency so far intensified that once more it dominates the schoolboy's talk and answers. I have been able to convince myself in the case of a few boys of secondary school age who had developed neuroses that the unconscious workings of their pleasure in the nonsense they produced played no less a part in their inefficiency than did their real ignorance.

Nor, later on, does the university student cease these demonstrations against the compulsion of logic and reality, the dominance of which, however, he feels growing ever more intolerant and unrestricted. A large amount of student 'rags' are a part of this reaction. For man is a 'tireless pleasure-seeker' – I forget where I came across this happy expression – and any renunciation of a pleasure he has once enjoyed comes hard to him. With the cheerful nonsense of his *Bierschwefel*,[1] for instance, the student tries to rescue his pleasure in freedom of thinking, of which he is being more and more deprived by the schooling of academic instruction. Much later still, indeed, when as a grown man he meets others in scientific congresses and once more feels himself a learner, after the meeting is over there comes the *Kneipzeitung*,[2] which distorts the new discoveries into nonsense and offers him a [127] compensation for the fresh addition to his intellectual inhibition.

The *Bierschwefel* and the *Kneipzeitung* give evidence by their names to the fact that the criticism which has repressed pleasure in nonsense has already grown so powerful that it cannot be put aside even temporarily without toxic assistance. A change in mood is the most precious thing that alcohol achieves for mankind, and on that account this 'poison' is not equally indispensable for everyone. A cheerful mood, whether it is produced endogenously or toxically, reduces the inhibiting forces, criticism among them, and makes accessible once again sources of pleasure which were under the weight of suppression. It is most instructive to

1 ['*Bierschwefel*': ludicrous speech delivered at a beer party.]

2 [A comic set of minutes. Literally 'tavern newspaper'.]

observe how the standards of joking sink as spirits rise. For high spirits replace jokes, just as jokes must try to replace high spirits, in which possibilities of enjoyment which are otherwise inhibited – among them the pleasure in nonsense – can come into their own: 'Mit wenig Witz und viel Behagen.'[1] Under the influence of alcohol the grown man once more becomes a child, who finds pleasure in having the course of his thoughts freely at his disposal without paying regard to the compulsion of logic.

I hope I have now also shown that the absurdity techniques of jokes are a source of pleasure. It need only be repeated that this pleasure arises from an economy in psychical expenditure or a relief from the compulsion of criticism.

If we look back once more at the three separate groups of joke techniques, we see that the first and third of these groups – the replacement of thing associations with word associations and the use of absurdity – can be brought together as re-establishing old liberties and getting rid of the burden of intellectual upbringing; they are psychical reliefs, which can in a sense be contrasted with the economizing which constitutes the technique of the second group. Relief from psychical expenditure that is already there and economizing in psychical expenditure that is only about to be called for – from these two principles all the techniques of jokes, and accordingly all pleasure from these techniques,
[128] are derived. The two species of technique and of obtaining pleasure coincide – in the main at all events – with the distinction between verbal and conceptual jokes.

[2]

The preceding discussion has given us unawares an insight into the evolution or psychogenesis of jokes, which we will now examine more closely. We have made the acquaintance of preliminary stages of jokes, and their development into tendentious jokes will probably uncover fresh relations between the various characteristics of jokes. Before there is such a thing as a joke, there is something that we may describe as 'play' or as 'a jest'.

Play – let us keep to that name – appears in children while they are learning to make use of words and to put thoughts together. This play probably obeys one of the drives which compel children to practise their

1 ['With little wit and much enjoyment.' (Mephistopheles in Auerbach's Cellar, *Faust*, Part I, Scene 5.)]

capacities (Groos [1899]). In doing so they come across pleasurable effects, which arise from a repetition of what is similar, a rediscovery of what is familiar, similarity of sound, etc., and which are to be explained as unsuspected economies in psychical expenditure.[1] It is not to be wondered at that these pleasurable effects encourage children in the pursuit of play and cause them to continue it without regard for the meaning of words or the coherence of sentences. *Play* with words and thoughts, motivated by certain pleasurable effects of economy, would thus be the first stage of jokes.

This play is brought to an end by the strengthening of a factor that deserves to be described as the critical faculty or reasonableness. The play is now rejected as being meaningless or actually absurd; as a result of criticism it becomes impossible. Now, too, there is no longer any question of deriving pleasure, except accidentally, from the sources of rediscovery of what is familiar, etc., unless it happens that the growing individual is overtaken by a pleasurable mood which, like the child's cheerfulness, lifts the critical inhibition. Only in such a case does the old [129]
game of getting pleasure become possible once more; but the individual does not want to wait for this to happen nor to renounce the pleasure that is familiar to him. He thus looks about for means of making himself independent of the pleasurable mood, and the further development towards jokes is governed by the two endeavours: to avoid criticism and to find a substitute for the mood.

And with this the second preliminary stage of jokes sets in – the *jest*. It is now a question of prolonging the yield of pleasure from play, but at the same time of silencing the objections raised by criticism which would not allow the pleasurable feeling to emerge. There is only one way of reaching this end: the meaningless combination of words or the absurd putting together of thoughts must nevertheless have a meaning. The whole ingenuity of the joke-work is summoned up in order to find words and aggregations of thoughts in which this condition is fulfilled. All the technical methods of jokes are already employed here – in jests; moreover, linguistic usage draws no consistent line between a jest and a joke. What distinguishes a jest from a joke is that the meaning of the sentence which escapes criticism need not be valuable or new or even good; it need merely be *permissible* to say the thing in this way, even though it is unusual, unnecessary or useless to say it in this way. In jests what stands

1 [The pleasure taken by children in repetition (to which there is a further reference below, pp. 196–7, and on which Freud has already commented in a footnote to *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 237 *n.* 2) is a subject to which Freud returned much later, in his discussion of his hypothesis of a 'compulsion to repeat' in *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 35.]

in the foreground is the satisfaction of having made possible what was forbidden by criticism.

It is, for instance, simply a jest when Schleiermacher [see p. 31 above] defines *Eifersucht* [jealousy] as the *Leidenschaft* [passion] which *mit Eifer sucht* [with eagerness seeks] what *Leiden schafft* [causes pain]. It was a jest when Professor Kästner, who taught physics (and made jokes) at Göttingen in the eighteenth[1] century, asked a student named Kriegk, when he was enrolling himself for his lectures, how old he was. 'Thirty years old' was the reply, whereupon Kästner remarked: 'Ah! so I have the honour of meeting the Thirty Years' War [*Krieg*].' (Kleinpaul, 1890.) It was with a jest that the great Rokitansky[2] replied to the question of
[130] what were the professions of his four sons: 'Two *heilen* [heal] and two *heulen* [howl]' (two doctors and two singers). The information was correct and therefore not open to criticism; but it added nothing to what might have been expressed in the words in brackets. There can be no mistaking the fact that the answer was given the other form only on account of the pleasure which was produced by the unification and the similar sound of the two words.

I think now at length we see our way clearly. All through our consideration of the techniques of jokes we have been disturbed by the fact that they were not proper to jokes only; and yet the essence of jokes seemed to depend on them, since when they were got rid of by reduction the characteristics and the pleasure of the joke were lost. We now see that what we have described as the techniques of jokes – and we must in a certain sense continue to describe them so – are rather the sources from which jokes provide pleasure; and we feel that there is nothing strange in other procedures drawing from the same sources for the same end. The technique which is characteristic of jokes and peculiar to them, however, consists in their procedure for safeguarding the use of these methods of providing pleasure against the objections raised by criticism which would put an end to the pleasure. There is little that we can say in general about this procedure. The joke-work, as we have already remarked, shows itself in a choice of verbal material and conceptual situations which will allow the old play with words and thoughts to withstand the scrutiny of criticism; and with that end in view every peculiarity of vocabulary and every combination of thought sequences must be exploited in the most ingenious possible way. We may be in a position later to characterize the joke-work by a particular property; for the moment it remains unexplained how the selection favourable for jokes can be made. The purpose

1 [In the 1905 edition only, this is misprinted 'sixteenth'.]

2 [Carl Rokitansky (1804–78) was the founder of the Vienna school of pathological anatomy.]

and function of jokes, however – namely, the protection of sequences of words and thoughts from criticism – can already be seen in jests as their essential feature. Their function consists from the first in lifting internal inhibitions and in making sources of pleasure fertile which have been rendered inaccessible by those inhibitions; and we shall find that they remain loyal to this characteristic throughout their development.

We are also in a position now to assign its correct place to the factor [131] of 'sense in nonsense' (cf. the introduction, p. 11 f.), to which the authorities attribute such great importance as a distinguishing mark of jokes and as an explanation of their pleasurable effect. The two fixed points in what determines the nature of jokes – their purpose of continuing pleasurable play and their effort to protect it from the criticism of reason – immediately explain why an individual joke, though it may seem senseless from one point of view, must appear sensible, or at least allowable, from another. How it does so remains the affair of the joke-work; if it fails to do so, it is simply rejected as 'nonsense'. But there is no necessity for us to derive the pleasurable effect of jokes from the conflict between the feelings which arise (whether directly or along the path of 'bewilderment and enlightenment' [p. 12 f. above] from the simultaneous sense and nonsense of jokes. Nor have we any need to enter further into the question of how pleasure could arise from the alternation between 'thinking it senseless' and 'recognizing it as sensible'. The psychogenesis of jokes has taught us that the pleasure in a joke is derived from play with words or from the liberation of nonsense, and that the meaning of the joke is merely intended to protect that pleasure from being done away with by criticism.

In this way the problem of the essential character of jokes is already explained in jests. We may now turn to the further development of jests, to the point at which they reach their height in tendentious jokes. Jests still give the foremost place to the purpose of giving us enjoyment, and are content if what they say does not appear senseless or completely devoid of substance. If what a jest says possesses substance and value, it turns into a joke. A thought which would deserve our interest even if it were expressed in the most unpretentious form is now clothed in a form which must give us enjoyment on its own account.[1] A combination like [132]

1 As an example which shows the difference between a jest and a joke proper we may take the excellent joking remark with which a member of the 'Bürger' Ministry in Austria answered a question about the cabinet's solidarity: 'How can we *einstehen* [stand up] for one another if we can't *ausstehen* [stand] one another?' Technique: use of the same material with slight (contrary) modification. Logical and apposite thought: there can be no solidarity without mutual understanding. The contrary nature of the modification (*ein* [in] – *aus* [out]) corresponds to the

this can certainly not, we must suppose, have come about unintentionally; and we must try to discover the intention underlying the construction of the joke. An observation which we made earlier (in passing, as it seemed) will put us on the track. We said above (p. 82) that a good joke makes, as it were, a *total* impression of enjoyment on us, without our being able to decide at once what share of the pleasure arises from its joking form and what share from its apt thought content. We are constantly making mistakes in this apportionment. Sometimes we overestimate the goodness of the joke on account of our admiration of the thought it contains; another time, on the contrary, we overestimate the value of the thought on account of the enjoyment given us by its joking envelope. We do not know what is giving us enjoyment and what we are laughing at. This uncertainty in our judgement, which must be assumed to be a fact, may have provided the motive for the construction of jokes in the proper sense of the word. The thought seeks to wrap itself in a joke because in that way it recommends itself to our attention and can seem more significant and more valuable, but above all because this wrapping bribes our powers of criticism and confuses them. We are inclined to give the *thought* the benefit of what has pleased us in the *form* of the joke; and we are no longer inclined to find anything wrong that has given us enjoyment and so to spoil the source of a pleasure. If the joke has made us laugh, moreover, a disposition most unfavourable for criticism will have been established in us; for in that case something will have forced us into the mood which play has previously sufficed to produce, and for which the joke has tried by every possible means to make itself a substitute. Even though we have earlier asserted that such jokes are to be described as innocent and not yet tendentious, we must not forget that strictly speaking only jests are non-tendentious – that is, serve solely the aim of producing pleasure. Jokes, even if the thought contained in them is non-tendentious and thus only serves theoretical intellectual interests, are in fact never non-tendentious. They pursue the
[133] second aim: to promote the thought by augmenting it and guarding it against criticism. Here they are once again expressing their original nature by setting themselves up against an inhibiting and restricting power – which is now the critical judgement.

This, the first use of jokes that goes beyond the production of pleasure, points the way to their further uses. A joke is now seen to be a psychical factor possessed of power: its weight, thrown into one scale or the other,

incompatibility asserted in the thought and serves as a representation of it. – [The 'Bürger' (Middle-Class) Ministry took office after the new Austrian constitution was established in 1867, but owing to internal disharmony lasted for only a couple of years. Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 170 f.]

can be decisive. The major purposes and drives of mental life employ it for their own ends. The originally non-tendentious joke, which began as play, is *secondarily* brought into relation with purposes from which nothing that takes form in the mind can ultimately keep away. We know already what it is able to achieve in the service of the purpose of exposure, and of hostile, cynical and sceptical purposes. In the case of obscene jokes, which are derived from smut, it turns the third person who originally interfered with the sexual situation into an ally, before whom the woman must feel shame, by bribing him with the gift of its yield of pleasure. In the case of aggressive purposes it employs the same method in order to turn the hearer, who was indifferent to begin with, into a co-hater or co-despiser, and creates for the enemy a host of opponents where at first there was only one. In the first case it overcomes the inhibitions of shame and respectability by means of the bonus of pleasure which it offers; in the second it upsets the critical judgement which would otherwise have examined the dispute. In the third and fourth cases, in the service of cynical and sceptical purposes, it shatters respect for institutions and truths in which the hearer has believed, on the one hand by reinforcing the argument, but on the other by practising a new species of attack. Where argument tries to draw the hearer's criticism over on to its side, the joke endeavours to push the criticism out of sight. There is no doubt that the joke has chosen the method which is psychologically the more effective.

In this survey of the achievements of tendentious jokes, most prominence has been assumed by – what is more easily seen – the effect of jokes on the person who hears them. More important, however, from the point of view of our understanding, are the functions accomplished by jokes in the mind of the person who makes them or, to put it in the only correct way, the person to whom they occur [*einfällt*]T. We have already proposed [p. 87 f. above] – and here we have occasion to repeat the notion – that we should try to study the psychical phenomena of jokes with reference to their distribution between two people. We will make a provisional suggestion that the psychical process provoked by the joke in the hearer is in most cases modelled on that which occurs in its creator. The external obstacle which is to be overcome in the hearer corresponds to an internal inhibition in the maker of the joke. At the least the *expectation* of an external obstacle is present in the latter as an inhibiting idea. In certain cases the internal obstacle which is overcome by the tendentious joke is obvious; in Herr N.'s jokes, for instance, we were able to assume (p. 91) that not only did they make it possible for their hearers to enjoy

[134] *Einfall*

aggressiveness in the form of insults, but that above all they made it possible for him to produce them. Among the various kinds of internal inhibition or suppression there is one which deserves our special interest, because it is the most far-reaching. It is given the name of 'repression', and is recognized by its function of preventing the impulses subjected to it, and their derivatives, from becoming conscious. Tendentious jokes, as we shall see, are able to release pleasure even from sources that have undergone repression. If, as has been suggested above, the overcoming of external obstacles can in this way be traced back to the overcoming of internal inhibitions and repressions, we may say that tendentious jokes exhibit the main characteristic of the joke-work – that of liberating pleasure by getting rid of inhibitions – more clearly than any other of the developmental stages of jokes. Either they strengthen the purposes which they serve, by bringing assistance to them from impulses that are kept suppressed, or they put themselves entirely at the service of suppressed purposes.

We may be ready to admit that this is what tendentious jokes achieve; yet we must bear in mind that we do not understand how they are able to put these achievements into effect. Their power lies in the yield of pleasure which they draw from the sources of play upon words and of liberated nonsense; but if we are to judge by the impressions gained from non-tendentious jests, we cannot possibly think the amount of this
[135] pleasure great enough to attribute to it the strength to lift deeply rooted inhibitions and repressions. What we have before us here is in fact no simple effect of force but a more complex situation of release. Instead of setting out the long detour by which I reached an understanding of this situation, I will try to give a short synthetic exposition of it.

Fechner (1897, **1**, Chapter V) has put forward a 'principle of aesthetic assistance of intensification', which he has expressed as follows: '*If determinants of pleasure that in themselves produce little effect converge without mutual contradiction, there results a greater, and often a much greater, outcome of pleasure than corresponds to the pleasure value of the separate determinants – a greater pleasure than could be explained as the sum of the separate effects. Indeed, a convergence of this kind can even lead to a positive resultant of pleasure and the threshold of pleasure may be crossed, where the separate factors are too weak to do so: though they must, in comparison with others, show a perceptible advantage in enjoyableness*.' (Ibid., 51. The italics are Fechner's.)

The topic of jokes does not, I think, give us much opportunity of confirming the correctness of this principle, which can be shown to hold

good in many other aesthetic structures. As regards jokes we have learnt something else, which at least fringes upon this principle: namely, that where several pleasure-giving factors operate together we are not able to attribute to each of them the share it has really taken in bringing about the result. (See p. 82.) We can, however, vary the situation that is assumed in the 'principle of assistance' and, as a result of these fresh conditions, arrive at a number of questions which would deserve reply. What happens in general if, in a combination, determinants of pleasure and determinants of unpleasure converge? On what does the outcome depend and what decides whether that outcome is in pleasure or unpleasure?

The case of tendentious jokes is a special one among these possibilities. An impulse or urge is present which seeks to release pleasure from a particular source and, if it were allowed free play, would release it. Besides this, another urge is present which works against this generation of pleasure – inhibits it, that is, or suppresses it. The suppressing current must, as the outcome shows, be a certain amount stronger than the suppressed one, which, however, is not on that account abolished. Now let [136] us suppose that yet another urge makes its appearance which would release pleasure through the same process, though from other sources, and which thus operates in the same sense as the suppressed urge. What can the result be in such a case?

An example will give us our bearings better than this schematic discussion. Let us assume that there is an urge to insult a certain person; but this is so strongly opposed by feelings of propriety or of aesthetic culture that the insult cannot take place. If, for instance, it were able to break through as a result of some change of emotional condition or mood, this breakthrough by the insulting purpose would be felt subsequently [*nachträglich*] with unpleasure. Thus the insult does not take place. Let us now suppose, however, that the possibility is presented of deriving a good joke from the material of the words and thoughts used for the insult – the possibility, that is, of releasing pleasure from other sources which are not obstructed by the same suppression. This second development of pleasure could, nevertheless, not occur unless the insult were permitted; but as soon as the latter *is* permitted the new release of pleasure is also joined to it. Experience with tendentious jokes shows that in such circumstances the suppressed purpose can, with the assistance of the pleasure from the joke, gain sufficient strength to overcome the inhibition, which would otherwise be stronger than it. The insult takes place, because the joke is thus made possible. But the enjoyment obtained is not

only that produced by the joke: it is incomparably greater. It is so much greater than the pleasure from the joke that we must suppose that the hitherto suppressed purpose has succeeded in making its way through, perhaps without any diminution whatever. It is in such circumstances that the tendentious joke is received with the heartiest laughter.[1]

An examination of the determinants of laughing will perhaps lead us to a plainer idea of what happens when a joke affords assistance against suppression. [Cf. p. 127 ff. below.] Even now, however, we can see that the case of tendentious jokes is a special case of the 'principle of assistance'. A possibility of generating pleasure supervenes in a situation in
[137] which another possibility of pleasure is obstructed so that, as far as the latter alone is concerned, no pleasure would arise. The result is a generation of pleasure far greater than that offered by the supervening possibility. This has acted, as it were, as an *incentive bonus*; with the assistance of the offer of a small amount of pleasure, a much greater one, which would otherwise have been hard to achieve, has been gained. I have good reason to suspect that this principle corresponds with an arrangement that holds good in many widely separated departments of mental life and it will, I think, be expedient to describe the pleasure that serves to initiate the large release of pleasure as 'fore-pleasure', and the principle as the 'fore-pleasure principle'.[2]

We are now able to state the formula for the mode of operation of tendentious jokes. They put themselves at the service of purposes [*Tendenzen*] in order that, by means of using the pleasure from jokes as a fore-pleasure, they may produce new pleasure by lifting suppressions and repressions. If now we survey the course of development of the joke, we may say that from its beginning to its perfecting it remains true to its essential nature. It begins as play, in order to derive pleasure from the free use of words and thoughts. As soon as the strengthening of reasoning puts an end to this play with words as being senseless, and with thoughts as being nonsensical, it changes into a jest, in order that it may retain these sources of pleasure and be able to achieve fresh pleasure from the liberation of nonsense. Next, as a joke proper, but still a

1 [Freud had already propounded a parallel theory, to explain the often exaggerated amount of affect experienced in dreams, in Chapter VI, Section H, of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 427 ff.]

2 [Freud discussed the mechanism of fore-pleasure as it operates in the sexual act at considerable length in Section 1 of the third of his almost contemporary *Three Essays* (1905*d*), ibid., **7**, 184 ff. He also pointed out its use in aesthetic creations at the end of his paper on 'Creative Writers and Daydreaming' (1908*e*), ibid., **9**, 131, as well as in an earlier, posthumously published, paper on 'Psychopathic Characters on the Stage' (1942*a* [1905–06]), ibid., **7**, 300, and again in his *Autobiographical Study* (1925*d*), ibid., **20**, 57.]

non-tendentious one, it gives its assistance to thoughts and strengthens them against the challenge of critical judgement, a process in which the 'principle of confusion of sources of pleasure' is of use to it. And finally it comes to the help of major purposes which are combating suppression, in order to lift their internal inhibitions by the 'principle of fore-pleasure'. Reason, critical judgement, suppression – these are the forces against which it fights in succession; it holds fast to the original sources [138] of verbal pleasure and, from the stage of the jest onwards, opens new sources of pleasure for itself by lifting inhibitions. The pleasure that it produces, whether it is pleasure in play or pleasure in lifting inhibitions, can invariably be traced back to economy in psychical expenditure, provided that this view does not contradict the essential nature of pleasure and that it proves itself fruitful in other directions.[1]

1 Nonsense jokes, which have not had due attention paid to them in my account, deserve some supplementary consideration.

The importance which our views attach to the factor of 'sense in nonsense' might lead to a demand that every joke must be a nonsense joke. But this is not necessary, because it is only playing with *thoughts* that inevitably leads to nonsense; the other source of pleasure in jokes, playing with *words*, gives that impression only occasionally and does not invariably provoke the implied criticism. The twofold root of the pleasure in jokes – from playing with words and playing with thoughts, which corresponds to the very important distinction between verbal and conceptual jokes – makes it perceptibly more difficult to arrive at a concise formulation of general statements about jokes. Playing with words produces manifest pleasure as a result of the factors that have been enumerated above (recognition, and so on), and is consequently only to a small degree liable to suppression. Playing with thoughts cannot have its motive in this kind of pleasure; it meets with very energetic suppression, and the pleasure which it can yield is only pleasure in the lifting of an inhibition. It can accordingly be said that the pleasure in jokes exhibits a core of original pleasure in play and a casing of pleasure in lifting inhibitions. – We naturally do not perceive that our pleasure in a nonsense joke arises from our having succeeded in liberating a piece of nonsense in spite of its suppression; whereas we see directly that playing with words has given us pleasure. – The nonsense that still remains in a conceptual joke acquires secondarily the function of increasing our attention by bewildering us. It serves as a means of intensifying the effect of the joke, but only when it acts obtrusively, so that the bewilderment can hurry ahead of the understanding by a perceptible moment of time. The examples on p. 50 ff. have shown that, in addition to this, nonsense in a joke can be used to represent a judgement contained in the thought. But this, too, is not the primary significance of nonsense in jokes.

[*Added* 1912:] A number of productions resembling jokes can be classed alongside of nonsense jokes. There is no appropriate name for them, but they might well be described as 'idiocy masquerading as a joke'. There are countless numbers of them, and I will select only two samples:

'A man at the dinner table who was being handed fish dipped his two hands twice in the mayonnaise and then ran them through his hair. When his neighbour looked at him in astonishment, he seemed to notice his mistake and apologized: "I'm so sorry, I thought it was [139] spinach."'

Or: '"Life is a suspension bridge", said one man. – "Why is that?" asked the other. – "How should *I* know?" was the reply.' [The saying 'Life is a suspension bridge' appears again in Lecture XII of the *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 171.]

These extreme examples have an effect because they rouse the expectation of a joke, so that one tries to find a concealed sense behind the nonsense. But one finds none: they really are nonsense. The pretence makes it possible for a moment to liberate the pleasure in nonsense. These jokes are not entirely without a purpose; they are a 'take in', and give the person who tells them a certain amount of pleasure in misleading and annoying his hearer. The latter then damps down his annoyance by determining to tell them himself later on.

V
THE MOTIVES OF JOKES – JOKES AS A SOCIAL PROCESS

[140] It might seem superfluous to talk about the motives [*Motiven*][T] of jokes, since the aim of getting pleasure must be recognized as a sufficient motive for the joke-work. But, on the one hand, the possibility cannot be excluded of other motives as well having a share in the production of jokes and, on the other hand, bearing in mind some familiar experiences, we must raise the general question of the subjective determinants of jokes.

Two facts in particular make this necessary. Although the joke-work is an excellent method of getting pleasure out of psychical processes, it is nevertheless evident that not everyone is equally capable of making use of that method, the joke-work is not at everyone's command, and altogether only a few people have a plentiful amount of it; and these are distinguished by being spoken of as having 'wit' [*Witz*].[1] 'Wit' appears in this connection as a special capacity – rather in the class of the old mental 'faculties'; and it seems to emerge fairly independently of the others, such as intelligence, imagination, memory, etc. We must therefore presume the presence in these 'witty' people of special inherited dispositions or psychical determinants which permit or favour the joke-work.

I fear that we shall not get very far in exploring this question. We can only succeed here and there in advancing from an understanding of a particular joke to a knowledge of the subjective determinants in the mind of the person who made it. It is a remarkable coincidence that precisely the example of the joke on which we began our investigations of the technique of jokes also gives us a glimpse into the subjective determinants of jokes. I refer to Heine's joke, which has also been considered by Heymans and Lipps [p. 15 above]:

'. . . I sat beside Salomon Rothschild and he treated me quite as his equal – quite famillionairely.' ('Bäder von Lucca.')

[141] Heine puts this remark into the mouth of a comic character, Hirsch-Hyacinth, a Hamburg lottery agent, extractor of corns and professional valuer, the valet of the aristocratic Baron Cristoforo Gumpelino (formerly Gumpel). The poet evidently takes the greatest satisfaction in this creation of his, for he makes Hirsch-Hyacinth into a great talker and gives him the most amusing and plain-spoken speeches, and even lets

1 [See the Editors' Preface, p. 6 above.]

him display the practical philosophy of a Sancho Panza. It is a pity that Heine, who seems to have had no taste for dramatic construction, dropped this delightful character so soon. There are not a few passages in which the poet himself seems to be speaking, under a thin disguise, through the mouth of Hirsch-Hyacinth, and it soon becomes a certainty that this character is only a self-parody. Hirsch explains his reasons for having given up his former name and why he now calls himself 'Hyacinth'. He goes on: 'There's the further advantage that I already have an "H" on my signet, so that I don't need to have a new one cut.' But Heine himself effected the same economy when, at his baptism,[1] he changed his first name from 'Harry' to 'Heinrich'. Everyone, too, who is familiar with the poet's biography will recall that Heine had an uncle of the same name in Hamburg (a place which provides another connection with the figure of Hirsch-Hyacinth) who, as the rich man of the family, played a large part in his life. This uncle was also called 'Salomon', just like the old Rothschild who treated Hirsch so famillionairely. What seemed in Hirsch-Hyacinth's mouth no more than a jest soon reveals a background of serious bitterness if we ascribe it to the nephew, Harry-Heinrich. After all, he was one of the family, and we know that he had a burning wish to marry a daughter of this uncle's; but his cousin rejected him, and his uncle always treated him a little famillionairely, as a poor relation. His rich cousins in Hamburg never took him seriously. I recall a story told by an old aunt of my own, who had married into the Heine family, how one day, when she was an attractive young woman, she found sitting next to her at the family dinner table a person who struck her as uninviting and whom the rest of the company treated contemptuously. She herself felt no reason to be any more affable towards him. It was only many years later that she realized that this negligent and neglected cousin had been the poet Heinrich Heine. There is not a little evidence to show how much Heine suffered both in his youth and later [142] from this rejection by his rich relations. It was from the soil of this subjective emotion that the 'famillionairely' joke sprang.

The presence of similar subjective determinants may be suspected in some other of the great scoffer's jokes; but I know of no other one in which this can be demonstrated so convincingly. For this reason it is not easy to try to make any more definite statement about the nature of these personal determinants. Indeed, we shall be disinclined in general to claim such complicated determinants for the origin of every individual joke. Nor are the jokes produced by other famous men any more easily accessible to our examination. We get an impression that the subjective

1 [Heine was baptized a Christian at the age of 27.]

determinants of the joke-work are often not far removed from those of neurotic illness – when we learn, for instance, of Lichtenberg that he was a severely hypochrondriacal man, with all kinds of eccentricities. The great majority of jokes, and especially those that are constantly being newly produced in connection with the events of the day, are circulated anonymously; one would be curious to learn from what sort of people such productions originate. If one has occasion as a doctor to make the acquaintance of one of those people who, though not remarkable in other ways, are well known in their circle as jokers and the originators of many viable jokes, one may be surprised to discover that the joker is a disunited personality, disposed to neurotic disorders. The insufficiency of documentary evidence, however, will certainly prevent our setting up a hypothesis that a psychoneurotic constitution of this kind is a habitual or necessary subjective condition for the construction of jokes.

A more transparent case is offered, once more, by the Jewish jokes, which, as I have already mentioned (p. 98), are ordinarily made by Jews themselves, while the anecdotes about them from other sources scarcely ever rise above the level of comic stories or of brutal derision. What determines their participating in the jokes themselves seems to be the same as in the case of Heine's 'famillionairely' joke; and its significance seems to lie in the fact that the person concerned finds criticism or aggressiveness difficult so long as they are direct, and possible only along circuitous paths.

[143] Other subjective factors which determine or favour the joke-work are less wrapped in obscurity. The driving force [*Triebfeder*] for the production of innocent jokes is not infrequently an ambitious urge to show one's cleverness, to display oneself – a drive that may be equated with exhibitionism in the sexual field. The presence of numerous inhibited [*gehemmter*][T] drives, whose suppression has retained a certain degree of instability, will provide the most favourable disposition for the production of tendentious jokes. Thus individual components of a person's sexual constitution, in particular, can appear as motives for the construction of a joke. A whole class of obscene jokes allows one to infer the presence of a concealed inclination to exhibitionism in their inventors; aggressive tendentious jokes succeed best in people in whose sexuality a powerful sadistic component is demonstrable, which is more or less inhibited in real life.

Hemmung

The second fact which makes an enquiry into the subjective determination of jokes necessary[1] is the generally recognized experience that

1 [Cf. above, p. 122.]

no-one can be content with having made a joke for himself alone. An urge [*Drang*] to tell the joke to someone is inextricably bound up with the joke-work; indeed, this urge is so strong that often enough it is carried through in disregard of serious misgivings. In the case of the comic as well, telling it to someone else produces enjoyment; but the demand is not peremptory. If one comes across something comic, one can enjoy it by oneself. A joke, on the contrary, *must* be told to someone else. The psychical process of constructing a joke seems not to be completed when the joke occurs to one: something remains over which seeks, by communicating the idea, to bring the unknown process of constructing the joke to a conclusion.

We cannot in the first instance guess what the basis may be of this drive to communicate the joke. But we can see another peculiarity in jokes which distinguishes them from the comic. If I come across something comic, I myself can laugh heartily at it, though it is true that I am also pleased if I can make someone else laugh by telling it to him. But I myself cannot laugh at a *joke* that has occurred to me, that I have made, in spite of the unmistakable enjoyment that the joke gives me. It is possible that my need to communicate the joke to someone else is in some way connected with the laughter produced by it, which is denied to me but is manifest in the other person.

Why is it, then, that I do not laugh at a joke of my own? And what part [144]
is played in this by the other person?

Let us take the second question first. In the case of the comic, two persons are in general concerned: besides myself, the person in whom I find something comic. If inanimate things seem to me comic, that is on account of a kind of personification which is not of rare occurrence in our ideational life. The comic process is content with these two persons: the self and the person who is the object; a third person may come into it, but is not essential. Joking as a *play* with one's own words and thoughts is initially without a person as an object. But already at the preliminary stage of the *jest*, if it has succeeded in making play and nonsense safe from the protests of reason, it demands another person to whom it can communicate its result. But this second person in the case of jokes does not correspond to the person who is the object, but to the *third* person, the 'other' person in the case of the comic. It seems as though in the case of a jest the other person has the decision passed over to him on whether the joke-work has succeeded in its task – as though the self did not feel certain in its judgement on the point. Innocent jokes, too, jokes that serve to reinforce a thought, require another person to

test whether they have attained their aim. If a joke enters the service of the purpose of exposing or of a hostile purpose, it may be described as a psychical process between three persons, who are the same as in the case of the comic, though the part played by the third person is different; the psychical process in jokes is accomplished between the first person (the self) and the third (the outside person) and not, as in the case of the comic, between the self and the person who is the object.

Jokes are confronted by subjective determinants in the case of the third person too, and these may make their aim of producing pleasurable excitation unattainable. As Shakespeare (*Love's Labour's Lost*, Act V, Scene 2) reminds us:

> A jest's prosperity lies in the ear
> Of him that hears it, never in the tongue
> Of him that makes it . . .

[145] A person who is dominated by a mood concerned with serious thoughts is not fitted to confirm the fact that a jest has succeeded in rescuing the verbal pleasure. He must himself be in a cheerful or at least in an indifferent state of feeling in order to act as the jest's third person. The same obstacle applies to innocent and to tendentious jokes; but in the latter there is a further obstacle in the form of opposition to the purpose which the joke is trying to serve. The third person cannot be ready to laugh at an excellent obscene joke if the exposure applies to a highly respected relative of his own; before a gathering of priests and ministers no-one would venture to produce Heine's comparison of Catholic and Protestant clerics to retail tradesmen and employees of a wholesale business [p. 76 f. above]; and an audience composed of my opponent's devoted friends would receive my most successful pieces of joking invective against him not as jokes but as invective, and would meet them with indignation and not with pleasure. Some degree of benevolence or a kind of neutrality, an absence of any factor that could provoke feelings opposed to the purpose of the joke, is an indispensable condition if the third person is to collaborate in the completion of the process of making the joke.

Where there are no such obstacles to the operation of the joke, the phenomenon which is now the subject of our enquiry emerges: the pleasure which the joke has produced is more evident in the third person than in the creator of the joke. We must be content to say more '*evident*' where we should be inclined to ask whether the hearer's pleasure is not

more '*intense*' than that of the maker of the joke, since we naturally have no means of measuring and comparing. We see, however, that the hearer gives evidence of his pleasure with a burst of laughter, after the first person has as a rule produced the joke with a tensely serious look. If I repeat a joke that I have heard myself, I must, if I am not to spoil its effect, behave in telling it exactly like the person who made it. The question now arises whether we can draw any conclusions about the psychical process of constructing jokes from this factor of laughing at jokes.

It cannot be our design to consider at this point all that has been propounded and published on the nature of laughter. We may well be deterred from any such plan by the remarks with which Dugas, a pupil of Ribot's, prefaces his book *La psychologie du rire* (1902, 1): 'Il n'est pas de fait plus banal et plus étudié que le rire; il n'en est pas qui ait eu le don d'exciter davantage la curiosité du vulgaire et celle des philosophes; il [146] n'en est pas sur lequel on ait receuilli plus d'observations et bâti plus de théories, et avec cela il n'en est pas qui demeure plus inexpliqué. On serait tenté de dire avec les sceptiques qu'il faut être content de rire et de ne pas chercher à savoir pourquoi on rit, d'autant que peut-être la réflexion tue le rire, et qu'il serait alors contradictoire qu'elle en découvrît les causes.'[1]

On the other hand, we shall not miss the opportunity of making use for our purposes of an opinion on the mechanism of laughter which fits in excellently with our own line of thought. I have in mind the attempt at an explanation made by Herbert Spencer in his essay on 'The Physiology of Laughter' (1860). According to Spencer, laughter is a phenomenon of the discharge [*abfuhr*][T] of mental excitation [*seelischer Erregung*][T] *Seele* and a proof that the psychical employment of this excitation has suddenly come up against an obstacle. He describes the psychological situation which ends in laughter in the following words: 'Laughter naturally results only when consciousness is unawares transferred from great things to small – only when there is what we may call a *descending* incongruity.'[2]

1 ['There is no action that is more commonplace or that has been more widely studied than laughter. There is none that has succeeded more in exciting the curiosity both of ordinary people and of philosophers. There is none on which more observations have been collected and more theories built. But at the same time there is none that remains more unexplained. It would be tempting to say with the sceptics that we must be content to laugh and not try to know why we laugh, since it may be that reflection kills laughter and it would thus be a contradiction to think that it could discover its causes.']

2 Various points in this definition would call for detailed examination in an investigation of comic pleasure; this has already been undertaken by other authors and in any case does not concern us here. – I do not think Spencer has been happy in his explanation of why the discharge takes the particular paths whose excitation produces the somatic picture of laughter. The theme of the physiological explanation of laughter – that is, the tracing back or interpretation of the muscular

[147] In a quite similar sense French authors (e.g. Dugas) describe laughter as a '*détente*', a phenomenon of relaxation of tension. So too the formula proposed by Bain [1865, 250] – 'laughter a release from constraint'[1] – seems to me to diverge from Spencer's view much less than some authorities would have us believe.

Nevertheless, we feel a need to modify Spencer's notion, in part to give a more definite form to the ideas contained in it and in part to change them. We should say that laughter arises if a quota of psychical energy [*psychischer Energie*] which has earlier been used for the cathexis [*Besetzung*] of particular psychical paths has become unusable, so that it can find free discharge. We are well aware what 'evil looks' we are inviting with such a hypothesis; but we will venture to quote in our defence an apposite sentence from Lipps's book *Komik und Humor* (1898, 71), from which illumination is to be derived on more subjects than that of the comic and humour: 'Finally, specific psychological problems always lead fairly deep into psychology, so that at bottom no psychological problem can be treated in isolation.' The concepts of 'psychical energy' and 'discharge' and the treatment of psychical energy as a quantity have become habitual in my thoughts since I began to arrange the facts of psychopathology philosophically; and already in my *Interpretation of Dreams* (1900*a*) I tried (in the same sense as Lipps) to establish the fact that what are 'really psychically effective' are psychical processes which are unconscious in themselves, not the contents of consciousness.[2] It is
[148] only when I speak of the 'cathexis of psychical paths' that I seem to depart from the analogies commonly used by Lipps. My experiences of the displaceability [*Verschiebbarkeit*] of psychical energy along certain

actions characteristic of laughter – has been treated at length both before and since Darwin, but has still not been finally cleared up. I have one contribution to make to this theme. So far as I know, the grimace characteristic of smiling, which twists up the corners of the mouth, appears first in an infant at the breast when it is satisfied and satiated and lets go of the breast as it falls asleep. Here it is a genuine expression of the emotions, for it corresponds to a decision to take no more nourishment, and represents as it were an 'enough' or rather a 'more than enough'. This original meaning of pleasurable satiety may have brought the smile, which is after all the basic phenomenon of laughter, into its later relation with pleasurable processes of discharge.

1 [Misquoted by Freud (in English): '. . . a relief from constraint'. The slight difference in meaning is immaterial to the present argument.]

2 Cf. the sections 'On Psychical Force', etc. in Chapter VIII of Lipps's book quoted above. 'Thus the following general statement holds good: The factors of psychical life are not the contents of consciousness but the psychical processes which are in themselves unconscious. The task of psychology, if it does not merely wish to describe the contents of consciousness, must therefore consist in inferring the nature of these unconscious processes from the character of the contents of consciousness and their temporal connections. Psychology must be a theory of these processes. But a psychology of this kind will very soon find that there are quite a number of characteristics of these processes which are not represented in the corresponding contents of consciousness.' (Lipps, ibid., 123–4.) See also Chapter VII of my *Interpretation of Dreams* [*RSE*, **5**, 546–9].

paths of association, and of the almost indestructible persistence of the traces of psychical processes, have in fact suggested to me an attempt at picturing the unknown in some such way. To avoid misunderstanding, I must add that I am making no attempt to proclaim that the cells and nerve fibres, or the systems of neurons which are taking their place today, are these psychical paths, even though it would have to be possible in some manner which cannot yet be indicated to represent such paths by organic elements of the nervous system.[1]

In laughter, therefore, on our hypothesis, the conditions are present under which a sum of psychical energy which has hitherto been used for cathexis is allowed free discharge. And since laughter – not all laughter, it is true, but certainly laughter at a joke – is an indication of pleasure, we shall be inclined to relate this pleasure to the lifting of the cathexis which has previously been present. If we see that the hearer of a joke laughs but that its creator cannot laugh, this may amount to telling us that in the hearer a cathectic expenditure has been lifted and discharged, while in the construction of the joke there have been obstacles either to the lifting or to the possibility of discharge. The psychical process in the hearer, the joke's third person, can scarcely be more aptly described than by stressing the fact that he has bought the pleasure of the joke with very small expenditure on his own part. He might be said to have been presented with it. The words of the joke he hears necessarily bring about in him the idea or train of thought to the construction of which great internal inhibitions were opposed in him too. He would have had to make an effort of his own in order to bring it about spontaneously as the first person, he would have had to use at least as much psychical expenditure on doing so as would correspond to the strength of the inhibition, suppression or repression of the idea. He has saved this psychical expenditure. On the [149]
basis of our earlier discussions (p. 104) we should say that his pleasure corresponds to this economy. Our insight into the mechanism of laughter leads us rather to say that, owing to the introduction of the proscribed idea by means of an auditory perception, the cathectic energy used for the inhibition has now suddenly become superfluous and has been lifted, and is therefore now ready to be discharged by laughter. The two ways of expressing the facts amount to the same thing in essentials, since the expenditure economized corresponds exactly to the inhibition that has become superfluous. But the second method of expression is the more illuminating, since it allows us to say that the hearer of the joke laughs with the quota of psychical energy which has become free through the

1 [Some ten years earlier Freud had made an elaborate but abortive attempt to do this in his posthumously published 'Project for a Scientific Psychology' (Freud, 1950*a*; *RSE*, **1**).]

lifting of the inhibitory cathexis; we might say that he laughs this quota off.

If the person in whom the joke is formed cannot laugh, this, as we have already said [p. 129 above], points to a divergence from what happens in the third person that lies either in the lifting of the inhibitory cathexis or in the possibility of its discharge. But the first of these alternatives will not meet the case, as we shall see at once. The inhibitory cathexis must have been lifted in the first person as well, or otherwise no joke would have come about, since its formation was precisely in order to overcome a resistance of that kind; otherwise, too, it would be impossible for the first person to feel the pleasure in the joke which we have been obliged to trace back precisely to the lifting of the inhibition. All that remains, then, is the other alternative, namely that the first person cannot laugh, although he feels pleasure, because there is an interference with the possibility of discharge. An interference of this kind with the possibility of discharge, which is a necessary precondition of laughter, may arise from the liberated cathectic energy being immediately applied to some other endopsychic use. It is a good thing that our attention has been drawn to that possibility; and our interest in it will very soon be further engaged. Another condition, however, leading to the same result, may be realized in the first person of a joke. It is possible that no quota of energy at all that is capable of being manifested may be liberated, in spite of the lifting of the inhibitory cathexis. In the first person of a joke the joke-work is performed, which must correspond to a certain quota of new psychical [150] expenditure. Thus the first person himself produces the force which lifts the inhibition. This no doubt results in a yield of pleasure for him, and even, in the case of tendentious jokes, a very considerable one, since the fore-pleasure obtained by the joke-work itself takes over the lifting of *further* inhibitions; but the expenditure on the joke-work is in every case deducted from the yield resulting from the lifting of the inhibition – an expenditure which is the same as the one which the hearer of the joke avoids. What I have just said may be confirmed by observing that a joke loses its effect of laughter even in the third person as soon as he is required to make an expenditure on intellectual work in connection with it. The allusions made in a joke must be obvious and the omissions easy to fill; an awakening of conscious intellectual interest usually makes the effect of the joke impossible. There is an important distinction here between jokes and riddles. Perhaps the psychical constellation during the joke-work is in general not favourable to the free discharge of what has been gained. We are not, it seems, in a position to see further on this point; we

have been more successful in throwing light on one part of our problem – on why the third person laughs – than on its other part – on why the first person does *not* laugh.

Nevertheless, if we firmly accept these views on the determinants of laughter and on the psychical process in the third person, we are now in a position to give a satisfactory explanation of a whole number of peculiarities which jokes have been known to possess but which have not been understood. If a quota of cathectic energy capable of discharge is to be liberated in the third person, there are several conditions which must be fulfilled or which are desirable in order to act as encouragements: (1) It must be ensured that the third person is really making this cathectic expenditure. (2) It is necessary to guard against the cathectic expenditure, when it is liberated, finding some other psychical use instead of offering itself for motor discharge. (3) It cannot but be an advantage if the cathexis which is to be liberated in the third person is intensified beforehand, raised to a greater height. All these aims are served by particular methods of the joke-work, which may be classed together as secondary or auxiliary techniques:

[1] The first of these conditions lays down one of the necessary [151]
qualifications of the third person as hearer of the joke. It is essential that he should be in sufficient psychical accord with the first person to possess the same internal inhibitions, which the joke-work has overcome in the latter. A person who is responsive to smut will be unable to derive any pleasure from witty jokes of exposure; Herr N.'s attacks will not be understood by uneducated people who are accustomed to give free play to their desire to insult. Thus every joke calls for a public of its own and laughing at the same jokes is evidence of far-reaching psychical conformity. Here, moreover, we have arrived at a point which enables us to guess still more precisely what takes place in the third person. He must be able as a matter of habit to erect in himself the same inhibition which the first person's joke has overcome, so that, as soon as he hears the joke, the readiness for this inhibition will compulsively or automatically awaken. This readiness for inhibition, which I must regard as a real expenditure, analogous to mobilization in military affairs, will at the same moment be recognized as superfluous or too late, and so be discharged *in statu nascendi* by laughter.[1]

[2] The second condition for making free discharge possible – that the liberated energy shall be prevented from being used in any other way – seems very much the more important. It provides the theoretical

1 The notion of the *status nascendi* has been used by Heymans (1896) in a somewhat different connection.

explanation of the uncertainty of the effect of jokes when the thoughts expressed in a joke arouse powerfully exciting ideas in the hearer; in that case the question whether the purposes of the joke agree with or contradict the circle of thoughts by which the hearer is dominated will decide whether his attention will remain with the joking process or be withdrawn from it. Of still greater theoretical interest, however, are a class of auxiliary techniques which clearly serve the end of entirely detaching the hearer's attention from the joking process, and of allowing that process to run its course automatically. I deliberately say 'automatically' and not 'unconsciously', because the latter description would be misleading. It is only a question here of holding back an increased cathexis of attention from the psychical process when the joke is heard; and the usefulness of these auxiliary techniques rightly
[152] leads us to suspect that precisely the cathexis of attention has a great share in the supervision and fresh employment of liberated cathectic energy.

It appears to be far from easy to avoid the endopsychic employment of cathexes that have become superfluous, for in our thought processes we are constantly in the habit of displacing such cathexes from one path to another without losing any of their energy by discharge. Jokes make use of the following methods with that aim in view. Firstly, they try to keep their expression as short as possible, so as to offer fewer points of attack to the attention. Secondly, they observe the condition of being easy to understand (see above [p. 130]); as soon as they call for intellectual work which would demand a choice between different paths of thought, they would endanger their effect not only by the unavoidable expenditure of thought but also by the awakening of attention. But besides this they employ the device of distracting attention by putting forward something in the joke's form of expression which catches it, so that in the meantime the liberation of the inhibitory cathexis and its discharge may be completed without interruption. This aim is already fulfilled by the omissions in the joke's wording; they offer an incitement to filling in the gaps and in that way succeed in withdrawing the joking process from attention. Here the technique of riddles, which attract the attention [p. 130], is, as it were, brought into the service of the joke-work. Far more effective even are the façades which we have found especially in some groups of tendentious jokes (p. 92 ff.). The syllogistic façades admirably fulfil the aim of holding the attention by setting it a task. While we are beginning to wonder what was wrong with the reply, we are already laughing; our attention has been caught unawares and the discharge of the liberated

inhibitory cathexis has been completed. The same is true of jokes with a *comic* façade, in which the comic comes to the help of the joke technique. A comic façade encourages the effectiveness of a joke in more than one way; not only does it make the automatism of the joking process possible, by holding the attention, but it also facilitates the discharge by the joke, by sending on ahead a discharge of a comic kind. The comic is here operating exactly like a bribing fore-pleasure, and we can in this way understand how some jokes are able to renounce entirely the fore- [153]
pleasure produced by the ordinary methods of joking and make use only of the comic for fore-pleasure. Among the joke techniques proper, it is in particular displacement and representation by something absurd which, apart from their other qualifications, give rise, too, to a distraction of the attention which is desirable for the automatic course of the joking process.[1]

As we can already guess, and as we shall see more clearly later on, we have discovered in the condition of distracting the attention a by no means unessential feature of the psychical process in the hearer of a joke.[2] In connection with this there are still other things that we can [154]
understand. Firstly, there is the question why we scarcely ever know what we are laughing at in a joke, though we can discover it by an

1 I should like to discuss yet another interesting characteristic of joke technique, in connection with an example of a displacement joke. Once when Gallmeyer, that actress of genius, was asked [in the course of an official examination] the unwelcome question 'Your age?' she is said to have replied 'in the tone of voice of a Gretchen and with her eyes bashfully cast down: "at Brünn".' This is a model displacement. When she was asked her age she replied by giving the place of her birth. She was thus anticipating the next question and was letting it be understood that she would be glad to know that this one question had been passed over. Yet we feel that in this instance the characteristic of jokes is not expressed in all its purity. It is too clear that the question is being evaded, the displacement is too obvious. Our attention understands at once that what is in question is an intentional displacement. In the other displacement jokes the displacement is disguised; our attention is held by the effort to detect it. In the displacement joke recorded on p. 48, in the reply made to a recommendation of a riding horse 'What should I be doing in Pressburg at half-past six?' the displacement is also prominent. But to make up for this it has a confusing effect on the attention through its nonsensical nature, whereas in the actress's examination we are able to recognize her displacement reply immediately. – [*Added* 1912:] What are known as '*Scherzfragen*' [facetious questions] deviate from jokes in another direction, though apart from this they may make use of the best techniques. Here is an example of one of them, which uses the technique of displacement: 'What is a cannibal who has eaten his father and his mother?' – 'An orphan.' – 'And if he has eaten all his other relations as well?' – 'The sole heir.' – 'And where will a monster of that kind find sympathy?' – 'In the dictionary under "S".' 'Facetious questions' of this kind are not proper jokes because the joking answers that they call for cannot be guessed in the same way as are the allusions, omissions, etc. of jokes. – [Josefine Gallmeyer (1838–84) was a soubrette actress, extremely popular in Vienna.]

2 [Freud remarked elsewhere that many functions are improved in the absence of conscious attention (e.g. *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 27). He also pointed out later that the device of distracting the attention is a technique that is used in hypnotic suggestion. Cf. Chapter X of his *Group Psychology* (1921*c*), ibid., **18**, 117–18. He expressed his opinion, too, in a posthumously published paper on 'Psychoanalysis and Telepathy' (1941*d* [1921]), ibid., **18**, 173–4, that the same procedure was at work in certain cases of thought-reading. A first hint at the idea of the device is probably to be seen in Freud's technical contribution to the *Studies on Hysteria* (1895*d*), ibid., **2**, 241 f., in his explanation of the mechanism of his own 'pressure' technique.]

analytic investigation. The laughter is, in fact, the product of an automatic process which is only made possible by our conscious attention's being kept away from it. Secondly, we are able to understand the peculiar fact about jokes that they only produce their full effect on the hearer if they are new to him, if they come as a surprise to him. This characteristic of jokes (which determines the shortness of their life and stimulates the constant production of new jokes) is evidently due to the fact that the very nature of surprising someone or taking him unawares implies that it cannot succeed a second time. When a joke is repeated, the attention is led back to the first occasion of hearing it as the memory of it arises. And from this we are carried on to an understanding of the urge to tell a joke one has heard to other people who have not yet heard it. One probably recovers from the impression the joke makes on a newcomer some of the possibility of enjoyment that has been lost owing to its lack of novelty. And it may be that it was an analogous motive that drove the creator of the joke in the first instance to tell it to someone else.

[3] In the third place I shall bring forward – but this time not as necessary conditions but only as encouragements to the process of joking – the auxiliary technical methods of the joke-work which are calculated to increase the quota which obtains discharge and in that way intensify the effect of the joke. These, it is true, also for the most part increase the attention that is paid to the joke, but they make this effect innocuous once more by simultaneously holding it and inhibiting its mobility. Anything that provokes interest and bewilderment works in these two directions – thus, in particular, nonsense, and contradiction, too, the 'contrast of ideas' [p. 11 f. above] which some authorities have tried to make into the essential characteristic of jokes, but which I can only
[155] regard as a means of intensifying their effect. Anything that bewilders calls up in the hearer the state of distribution of energy which Lipps has called 'psychical damming up' [p. 104]; and he is no doubt also correct in supposing that the 'discharge' is the more powerful, the higher was the preceding damming up. Lipps's account, it is true, does not relate specifically to jokes but to the comic in general; but we may regard it as most probable that in jokes, too, the discharge of an inhibitory cathexis is similarly increased by the height of the damming up.

It now begins to dawn on us that the technique of jokes is in general determined by two sorts of purposes – those that make the construction [*Bildung*][T] of the joke possible in the first person and those that are intended to guarantee the joke the greatest possible pleasurable effect on the third person. The Janus-like,

two-way-facing character of jokes, which protects their original yield of pleasure from the attacks of critical reason, and the mechanism of fore-pleasure belong to the first of these purposes; the further complication of the technique by the conditions that have been enumerated in the present chapter takes place out of regard for the joke's third person. A joke is thus a double-dealing rascal who serves two masters at once. Everything in jokes that is aimed at gaining pleasure is calculated with an eye to the third person, as though there were internal and insurmountable obstacles to it in the first person. And this gives us a full impression of how indispensable this third person is for the completion of the joking process. But whereas we have been able to obtain a fairly good insight into the nature of this process in the third person, the corresponding process in the first person seems still to be veiled in obscurity. Of the two questions we asked [pp. 124–6 above], 'Why are we unable to laugh at a joke we have made ourselves?' and 'Why are we driven to tell our own joke to someone else?', the first has so far evaded our reply. We can only suspect that there is an intimate connection between the two facts that have to be explained: that we are compelled to tell our joke to someone else *because* we are unable to laugh at it ourselves. Our insight into the conditions for obtaining and discharging pleasure which prevail in the *third* person enables us to infer as regards the *first* person that in him the conditions for discharge are lacking and those for obtaining pleasure only incompletely fulfilled. That being so, it cannot be disputed that we supplement our pleasure by attaining the laughter that is impossible for us by the roundabout path of the impression we have of the person who has been made to laugh. As Dugas has put it, we laugh as it were '*par ricochet*' [on the rebound]. Laughter is among the highly infectious expressions of psychical states. When I make the other person laugh by telling him my joke, I am actually making use of him to arouse my own laughter; and one can in fact observe that a person who has begun by telling a joke with a serious face afterwards joins in the other person's laughter with a moderate laugh. Accordingly, telling my joke to another person would seem to serve several purposes: firstly, to give me objective certainty that the joke-work has been successful; secondly, to complete my own pleasure by a reaction from the other person upon myself; and thirdly – where it is a question of repeating a joke that one has not produced oneself – to make up for the loss of pleasure owing to the joke's lack of novelty. [156]

At the conclusion of these discussions of the psychical processes in jokes insofar as they take place between two persons, we may glance back at the factor of economy, which has been in our mind as being of importance in arriving at a psychological view of jokes ever since our first explanation of their technique. We have long since abandoned the most obvious but simplest view of this economy – that it is a question of an avoidance of psychical expenditure in general, such as would be involved by the greatest possible restriction in the use of words and in the establishment of chains of thought. Even at that stage we told ourselves that being concise or laconic was not enough to make a joke [p. 39 above]. A joke's brevity is of a peculiar kind – 'joking' brevity. It is true that the original yield of pleasure, produced by playing with words and thoughts, was derived from mere economy in expenditure; but with the development of play into a joke the tendency to economy too must alter its aims, for the amount that would be saved by the use of the same word or the avoidance of a new way of joining ideas together would certainly count for nothing as compared with the immense expenditure on our intellectual activity. I may perhaps venture on a comparison between psychical economy and a business enterprise. So long as the turnover in the business is very small, the important thing is that outlay in general shall be [157] kept low and administrative costs restricted to the minimum. Economy is concerned with the absolute height of expenditure. Later, when the business has expanded, the importance of the administrative cost diminishes; the height reached by the amount of expenditure is no longer of significance provided that the turnover and profits can be sufficiently increased. It would be niggling, and indeed positively detrimental, to be conservative over expenditure on the administration of the business. Nevertheless, it would be wrong to assume that when expenditure was absolutely great there would be no room left for the tendency to economy. The mind of the manager, if it is inclined to economy, will now turn to economy over details. He will feel satisfaction if a piece of work can be carried out at smaller cost than previously, however small the saving may seem to be in comparison with the size of the total expenditure. In a quite analogous fashion, in our complex psychical business too, economy in detail remains a source of pleasure, as may be seen from everyday happenings. Anyone who used to have his room lighted by gas and has now had electricity installed will for quite a time be aware of a definite feeling of pleasure when he switches on the electric light; he will feel it as long as the memory is revived in him at that moment of the complicated manoeuvres that were necessary for lighting the gas. Similarly, the

economies in psychical inhibitory expenditure brought about by a joke – though they are small in comparison with our total psychical expenditure – will remain a source of pleasure for us because they save us a particular expenditure which we have been accustomed to make and which we were already prepared to make on this occasion as well. The factor of the expenditure's being one that was expected and prepared for moves unmistakably into the foreground.

A localized economy, such as we have just been considering, will not fail to give us momentary pleasure; but it will not bring a lasting relief so long as what has been saved at this point can be put to use elsewhere. It is only if this disposal elsewhere can be avoided that this specialized economy is transformed into a general relief of psychical expenditure. Thus, as we come to a better understanding of the psychical processes of jokes, the factor of relief takes the place of economy. It is obvious that the former gives a greater feeling of pleasure. The process in the joke's [158]
first person produces pleasure by lifting inhibition and diminishing local expenditure; but it seems not to come to rest until, through the intermediary of the interpolated third person, it achieves general relief through discharge.

C. THEORETIC PART

VI
THE RELATION OF JOKES TO DREAMS AND TO THE UNCONSCIOUS

[159] At the end of the chapter in which I was concerned with discovering the technique of jokes, I remarked (p. 77 f.) that the processes of condensation, with or without the formation of substitutes, of representation by nonsense and by the opposite, of indirect representation, and so on, which, as we found, play a part in producing jokes, show a very far-reaching agreement with the processes of the 'dream-work'. I further promised, on the one hand, that we would study these similarities more closely and, on the other hand, that we would examine the common element in jokes and dreams which seems to be thus suggested. It would be much easier for me to carry out this comparison if I could assume that one of the two objects of comparison – the 'dream-work' – was already familiar to my readers. But it will probably be wiser not to make that assumption. I have an impression that my *Interpretation of Dreams*, published in 1900, provoked more 'bewilderment' than 'enlightenment' among my fellow specialists; and I know that wider circles of readers have been content to reduce the contents of the book to a catchword ('wish fulfilment') which can be easily remembered and conveniently misused.

Continued concern with the problems treated there – for which my medical practice as a psychotherapist has given me abundant opportunity – has not brought me up against anything that might have called for alterations or improvements in my lines of thought; I can therefore wait quietly till my readers' understanding catches up with me or till judicious criticism has shown me the fundamental errors in my view. For the purpose of making the comparison with jokes, I will now repeat, briefly and concisely, the most essential information about dreams and the dream-work.

We know a dream from what seems as a rule a fragmentary memory [160]
of it which we have after waking. It appears as a mesh-work of sense impressions, mostly visual but also of other kinds, which have simulated an experience, and with which thought processes ('knowledge' in the dream) and expressions of affect may be mingled. What we thus remember of the dream I call '*the dream's manifest content*'. It is often entirely absurd and confused – sometimes only the one or the other. But even if it is quite coherent, as it is in the case of some anxiety dreams, it confronts our mental life as something alien, for whose origin one cannot in any way account. The explanation of these characteristics of dreams has hitherto been looked for in dreams themselves, by regarding them as indications of a disordered, dissociated and so to say 'sleepy' activity of the nervous elements.

I have on the contrary shown that this strange 'manifest' content of the dream can regularly be made intelligible as a mutilated and altered transcript of certain rational psychical structures which deserve the name of '*latent dream thoughts*'. We arrive at a knowledge of these by dividing the dream's manifest content into its component parts, without considering any apparent meaning it may have [as a whole], and by then following the associative threads which start from each of what are now isolated elements. These interweave with one another and finally lead to a tissue of thoughts which are not only perfectly rational but can also be easily fitted into the known context of our mental processes. In the course of this 'analysis', the content of the dream will have cast off all the peculiarities that puzzled us. But if the analysis is to succeed, we must, while it proceeds, firmly reject the critical objections which will unceasingly arise to the reproduction of the various intermediary associations.

A comparison of the recollected manifest content of the dream with the latent dream thoughts thus discovered gives rise to the concept of the 'dream-work'. The dream-work is the name for the whole sum of transforming processes which have converted the dream thoughts into the manifest dream. The surprise with which we formerly regarded the dream now attaches to the dream-work.

The achievements of the dream-work can, however, be described as follows. A tissue of thoughts, usually a very complicated one, which has been built up during the day and has not been completely dealt with – 'a [161]
day's residue' – continues during the night to retain the quota of energy – the 'interest' – claimed by it, and threatens to disturb sleep. This 'day's residue' is transformed by the dream-work into a dream and made

innocuous to sleep. In order to provide a fulcrum for the dream-work, the 'day's residue' must be capable of constructing a wish – which is not a very hard condition to fulfil. The wish arising from the dream thoughts forms the preliminary stage and later the core of the dream. Experience derived from analyses – and not the theory of dreams – informs us that in children any wish left over from waking life is sufficient to call up a dream, which emerges as connected and ingenious but usually short, and which is easily recognized as a 'wish fulfilment'. In the case of adults it seems to be a generally binding condition that the wish which creates the dream shall be one that is alien to conscious thinking – a repressed wish – or will possibly at least have reinforcements that are unknown to consciousness. Without assuming the existence of the unconscious in the sense explained above [p. 128], I should not be able to develop the
Deutung theory of dreams further or to interpret [*deuten*][T] the material met with in dream analyses. The action of this unconscious wish upon the consciously rational material of the dream thoughts produces the dream. While this happens, the dream is, as it were, dragged down into the unconscious, or, more precisely, is submitted to a treatment such as is met with at the level of unconscious thought processes and is characteristic of that level. Hitherto it is only from the results of the 'dream-work' that we are in fact acquainted with the characteristics of unconscious thinking and its differences from thinking that is capable of becoming conscious – 'preconscious' thinking.

A theory which is novel, which lacks simplicity and which runs counter to our habits of thought can scarcely gain in clarity from a concise presentation. All I can aim at in these remarks, therefore, is to draw attention to the fuller treatment of the unconscious in my *Interpretation of Dreams* and to the writings of Lipps, which seem to me of the highest importance. I am aware that anyone who is under the spell of a good academic philosophical education, or who takes his opinions at long range from some so-called system of philosophy, will be opposed to
[162] the assumption of an 'unconscious psychical' in the sense in which Lipps and I use the term, and will prefer to prove its impossibility on the basis of a definition of the psychical. But definitions are a matter of convention and can be altered. I have often found that people who dispute the unconscious as being something absurd and impossible have not formed their impressions from the sources from which I at least was brought to the necessity of recognizing it. These opponents of the unconscious had never witnessed the effect of a post-hypnotic suggestion, and when I have told them examples from my analyses with non-hypnotized

neurotics they have been filled with the greatest astonishment. They had never realized the idea that the unconscious is something which we really do not know, but which we are obliged by compelling inferences to add [*ergänzen*]; they had understood it as being something capable of becoming conscious but which was not being thought of at the moment, which did not occupy 'the focal point of attention'. Nor had they ever tried to convince themselves of the existence in their own minds of unconscious thoughts like these by analysing one of their own dreams; and when I attempted to do so with them they could only greet their own associations [*Einfälle*] with surprise and confusion. I have also formed an impression that fundamental emotional resistances stand in the way of accepting the 'unconscious', and that these are based on the fact that no-one wants to get to know his unconscious and that the most convenient plan is to deny [*leugnen*] its possibility altogether.

The dream-work, then – to which I return after this digression – submits the thought material, which is brought forward in the optative mood, to a most strange revision. First, it takes the step from the optative to the present indicative; it replaces 'Oh! if only . . .' with 'It is'. The 'It is' is then given a hallucinatory representation; and this I have called the 'regression' in the dream-work – the path that leads from thoughts to perceptual images, or, to use the terminology of the still unknown topography of the mental apparatus (which is not to be taken anatomically), from the region of thought constructions [*Denkbildungen*][T] to that of sensory perceptions. On this path, which is in the reverse direction to that taken by the course of development of mental complications, the dream thoughts are given a pictorial character; and eventually a plastic situation is arrived at which is the core of the manifest 'dream picture'. In order for it to be possible for the dream thoughts to be represented in sensory form, their expression has to undergo far-reaching modifications. But while the thoughts are being changed back into sensory images still further alterations occur in them, some of which can be seen to be necessary while others are surprising. We can understand that, as a subsidiary result of regression, almost all the internal relations between the thoughts which linked them together will be lost in the manifest dream. The dream-work, as we might say, undertakes to represent only the raw material of the ideas and not the logical relations in which they stand to one another; or at all events it reserves the liberty to disregard the latter. On the other hand, there is another part of the dream-work which we cannot attribute to regression, to the change back into sensory images; and it is precisely this part which has an important bearing on our

Bildung

[163]

analogy with the formation of jokes. In the course of the dream-work the material of the dream thoughts is subjected to a quite extraordinary compression or *condensation*. A starting point for it is provided by any common elements that may be present in the dream thoughts, whether by chance or from the nature of their content. Since these are not as a rule sufficient for any considerable condensation, new artificial and transient common elements are created in the dream-work, and to this end there is actually a preference for the use of words the sound of which expresses different meanings. The newly created common elements of condensation enter the manifest content of the dream as representatives of the dream thoughts, so that an element in the dream corresponds to a nodal point or junction in the dream thoughts, and, as compared with these latter, must quite generally be described as 'overdetermined' ['*überdeterminiert*'][T]. The fact of condensation is the piece of the dream-work which can be most easily recognized; it is only necessary to compare the text of a dream as it is noted down with the record of the dream thoughts arrived at by analysis in order to get a good impression of the extensiveness of dream condensation.

Überdeterminierung

It is less easy to convince oneself of the second great modification of the dream thoughts that is brought about by the dream-work – the process that I have named 'dream *displacement*'. This is exhibited in the fact that things that lie on the periphery of the dream thoughts and are of minor importance occupy a central position and appear with great sensory intensity in the manifest dream, and *vice versa*. This gives the dream the appearance of being displaced in relation to the dream thoughts, and this displacement is precisely what brings it about that the dream confronts waking mental life as something alien and incomprehensible. In order that a displacement of this kind may occur, it must be possible for the cathectic energy to pass over uninhibited from the important ideas [*Vorstellungen*] to the unimportant ones – which, in normal thought that is capable of being conscious, can only give an impression of 'faulty reasoning'.

[164]

Transformation with a view to the possibility of representation, condensation and displacement are the three major achievements that may be ascribed to the dream-work. A fourth, which was perhaps too briefly considered in *The Interpretation of Dreams*, is not relevant for our present purposes.[1] If the ideas of a 'topography of the mental apparatus'

1 ['Secondary revision.' Cf. *The Interpretation of Dreams* (1900*a*), Chapter VI, Section I; *RSE*, **5**, 437 ff. Elsewhere, however, Freud (1923*a*) considers that this is *not* part of the dream-work (ibid., **18**, 235).]

and of 'regression' are consistently followed up (and only in that way could these working hypotheses come to have any value), we must attempt to determine the stages of regression at which the various transformations of the dream thoughts take place. This attempt has not yet been seriously undertaken; but it can at least be stated with certainty that displacement must take place in the thought material while it is at the stage of the unconscious processes, while condensation must probably be pictured as a process stretching over the whole course of events till the perceptual region is reached. But in general we must be content to assume that all the forces which take part in the formation of dreams operate simultaneously. Though one must, as will be realized, exercise reserve in dealing with such problems, and though there are fundamental doubts, which cannot be entered into here, as to whether the question should be framed in this manner,[1] yet I should like to venture on the assertion that the process of the dream-work preparatory to the dream [165]
must be located in the region of the unconscious. Thus, speaking roughly, there would in all be three stages to be distinguished in the formation of a dream: first, the transplanting of the preconscious day's residues into the unconscious, in which the conditions governing the state of sleep must play a part; then, the dream-work proper in the unconscious; and thirdly, the regression of the dream material, thus revised, to perception, in which form the dream becomes conscious.

The following forces [*Kräfte*] may be recognized as having a share in the formation of dreams: the wish to sleep, the cathexis of energy that still remains in the day's residues after it has been lowered by the state of sleep, the psychical energy of the dream-constructing unconscious wish and the opposing force of the 'censorship' ['*Zensur*'], which dominates daytime life and is not completely lifted during sleep. The task of dream formation is above all to overcome the inhibition from the censorship; and it is precisely this task which is solved by the displacements of psychical energy within the material of the dream thoughts.

Let us now recall what it was during our investigation of jokes that gave us occasion to think of dreams. We found that the characteristics and effects of jokes are linked with certain forms of expression or technical methods, among which the most striking are condensation, displacement and indirect representation. Processes, however, which lead to the same results – condensation, displacement and indirect

1 [This is probably a reference to the inadequacy of a purely topographical account of mental processes. A full discussion of these doubts followed much later, in the paper on 'The Unconscious' (1915*e*), Sections II and VII; *RSE*, **14**, 152 ff. and 172 ff.]

representation – have become known to us as peculiarities of the dream-work. Does not this agreement suggest the conclusion that joke-work and dream-work must, at least in some essential respect, be identical? The dream-work has, I think, been revealed to us as regards its most important characteristics. Of the psychical processes in jokes the part that is hidden from us is precisely the one that may be compared to the dream-work – namely, what happens during the formation of a joke in the first person. Shall we not yield to the temptation to construct that process on the analogy of the formation of a dream? A few of the characteristics of dreams are so alien to jokes that the part of the dream-work corresponding to those characteristics cannot be transferred [*übertragen*] to the formation of jokes. There is no doubt that the regression of the
[166] train of thought to perception is absent in jokes. But the other two stages of dream formation, the sinking of a preconscious thought into the unconscious and its unconscious revision, if they could be supposed to occur in joke formation, would present the precise outcome that we can observe in jokes. Let us decide, then, to adopt the hypothesis that this is the way in which jokes are formed in the first person: *a preconscious thought is given over for a moment to unconscious revision and the outcome of this is at once grasped by conscious perception*.

Before we examine this hypothesis in detail, we will consider an objection which might threaten our premise. We have started from the fact that the techniques of jokes indicate the same processes that are known to us as peculiarities of the dream-work. Now it is easy to argue against this that we should not have described the techniques of jokes as condensation, displacement, etc., and should not have arrived at such far-reaching conformities between the methods of representation in jokes and dreams, if our previous knowledge of the dream-work had not prejudiced our view of the technique of jokes; so that at bottom we are only finding in jokes a confirmation of the expectations with which we approached them from dreams. If this was the basis of the conformity, there would be no certain guarantee of its existence apart from our prejudice. Nor indeed have condensation, displacement and indirect representation been taken by any other author as explaining the forms of expression of jokes. This would be a possible objection, but not on that account a just one. It would be equally possible that it was indispensable for our views to be sharpened by a knowledge of the dream-work before we could recognize the real conformity. A decision will after all depend only on whether a critical examination can prove on the basis of individual examples that this view of the technique of

jokes is a forced one in whose favour other more plausible and deeper-going views have been suppressed, or whether such an examination is obliged to admit that the expectations derived from dreams can really be confirmed in jokes. I am of the opinion that we have nothing to fear from such criticism and that our procedure of 'reduction' (p. 21) has shown us reliably in what forms of expression to look for the techniques of jokes. And if we gave those techniques names which already anticipated the discovery of the conformity between joke technique and dream-work, we had a perfect right to do so and it was in fact nothing more than an easily justifiable simplification. [167]

There is another objection which would not affect our case so seriously but which is also not so open to a fundamental disproof. It might be said that, while it is true that these techniques of joking which fit in so well with our scheme deserve to be recognized, they are nevertheless not the only possible techniques of joking nor the only ones used in practice. It might be argued that under the influence of the model of the dream-work we have only looked for techniques of joking which fitted in with it, while others, overlooked by us, would have proved that this conformity was not invariably present. I really cannot venture to assert that I have succeeded in elucidating the technique of every joke in circulation; and I must therefore leave open the possibility that my enumeration of joke techniques will show some incompleteness. But I have not intentionally excluded from discussion any kind of technique that was clear to me, and I can declare that the commonest, most important and most characteristic methods of joking have not escaped my attention.

Jokes possess yet another characteristic which fits satisfactorily into the view of the joke-work which we have derived from dreams. We speak, it is true, of 'making' a joke; but we are aware that when we do so our behaviour is different from what it is when we make a judgement or make an objection. A joke has quite outstandingly the characteristic of being a notion that has occurred to us 'involuntarily'. What happens is not that we know a moment beforehand what joke we are going to make, and that all it then needs is to be clothed in words. We have an indefinable feeling, rather, which I can best compare with an '*absence*',[1] a sudden release of intellectual tension, and then all at once the joke is there – as a rule ready-clothed in words. Some of the techniques of jokes can be employed apart from them in the expression of a thought – for instance, the techniques of analogy or allusion. I can deliberately decide

1 [The French neurological term.]

to make an allusion. In such a case I begin by having a direct expression of my thought in my mind (in my inner ear); I inhibit myself from expressing it owing to a misgiving related to the external situation, and
[168] can almost be said to make up my mind to replace the direct expression with another form of indirect expression; and I then produce an allusion. But the allusion which arises in this way and which is formed under my continuous supervision is never a joke, however serviceable it may be in other ways. A joking allusion, on the other hand, emerges without my being able to follow these preparatory stages in my thoughts. I will not attach too much importance to this behaviour; it is scarcely decisive, though it agrees well with our hypothesis that in the formation of a joke one drops a train of thought for a moment and that it then suddenly emerges from the unconscious as a joke.

Jokes show a special way of behaving, too, in regard to association [*assoziativ*]. Often they are not at the disposal of our memory when we want them; but at other times, to make up for this, they appear involuntarily, as it were, and at points in our train of thought where we cannot see their relevance. These, again, are only small features, but nevertheless indicate their origin from the unconscious.

Let us now bring together those characteristics of jokes which can be referred to their formation in the unconscious. First and foremost there is the peculiar brevity of jokes – not, indeed, an essential, but an extremely distinctive feature. When we first came across it, we were inclined to regard it as an expression of the tendency to economy, but abandoned this view ourselves owing to obvious objections [p. 39 above]. It now seems to us rather a mark of the unconscious revision to which the joke thought has been subjected. For we cannot connect what corresponds to it in dreams, condensation, with any factor other than localization in the unconscious; and we must suppose that the determinants for such condensations, which are absent in the preconscious, are present in the unconscious thought process.[1] It is to be expected that in the process of
[169] condensation a few of the elements subjected to it will be lost, while others, which take over the cathectic energy of the former, will become intensified or over-intensified through the condensation. Thus the brevity of jokes, like that of dreams, would be a necessary concomitant of the

1 Apart from the dream-work and the technique of jokes, there is another kind of mental event in which I have been able to show that condensation is a regular and important process: namely the mechanism of normal (non-tendentious) *forgetting*. Unique impressions offer difficulties to forgetting; those that are analogous in any way are forgotten by being condensed in regard to their points of resemblance. Confusion between analogous impressions is one of the preliminary stages of forgetting. [Freud enlarged on this in a footnote added in 1907 to Section F of Chapter XII of *The Psychopathology of Everyday Life* (1901*b*), RSE, **6**, 235–6 *n*. 3.]

condensations which occur in both of them – in both cases a result of the process of condensation. This origin would also account for the special character of the brevity of jokes, a character that cannot be further defined but which is felt as a striking one.

In an earlier passage (p. 109) we regarded one of the outcomes of condensation – multiple use of the same material, play upon words and similarity of sound – as a localized economy, and the pleasure [*Lust*] produced by an (innocent) joke as derived from that economy, and later [p. 112 f.] we inferred that the original intention of jokes was to obtain a yield of pleasure of this kind from words – a thing which had been permitted at the stage of play but had been dammed up by rational criticism in the course of intellectual development. We have now adopted the hypothesis that condensations of this kind, such as serve the technique of jokes, arise automatically, without any particular intention, during thought processes in the unconscious. Have we not before us here two different views [*Auffassungen*] of the same fact which seem incompatible with each other? I do not think so. It is true that they are two different views, and that they need to be brought into harmony with each other; but they are not contradictory. One of them is merely foreign to the other; and when we have established a connection between them, we shall probably have made some advance in knowledge. The fact that such condensations are sources for a yield of pleasure is far from incompatible with the hypothesis that conditions for their production are easily found in the unconscious. We can, on the contrary, see a reason for the plunge into the unconscious in the circumstance that the pleasure-yielding condensations of which jokes are in need arise there easily. There are, moreover, two other factors which at first glance seem to be completely foreign to each other and to have come together as though by some undesired chance, but which on deeper investigation turn out to be intimately linked and indeed essentially one. I have in mind the two assertions that, on the one hand, jokes during their development at the stage of play (that is, during the childhood of reason) are [170]
able to bring about these pleasurable condensations and that, on the other hand, at higher stages they accomplish the same effect by plunging the thought into the unconscious. For the infantile is the source of the unconscious, and the unconscious thought processes are none other than those – the one and only ones – produced in early childhood. The thought which, with the intention of constructing a joke, plunges into the unconscious is merely seeking there for the ancient dwelling place of its former play with words. Thought is put back for a moment to the

stage of childhood so as once more to gain possession of the childish source of pleasure. If we did not already know it from research into the psychology of the neuroses, we should be led by jokes to a suspicion that the strange unconscious revision is nothing else than the infantile type of thought activity. It is merely that it is not very easy for us to catch a glimpse in children of this infantile way of thinking, with its peculiarities that are retained in the unconscious of adults, because it is for the most part corrected, as it were, *in statu nascendi*. But in a number of cases we succeed in doing so, and we then laugh at the children's 'silliness'. Any uncovering of unconscious material of this kind strikes us in general as 'comic'.[1]

It is easier to perceive the characteristics of these unconscious thought processes in the remarks made by sufferers from certain mental diseases. We should most probably be able (as Griesinger suggested long ago[2]) to understand the deliria of the insane and to make use of them as pieces of information, if we ceased to apply the demands of conscious thinking to them and if we treated them, like dreams, with our interpre-
[171] tative technique.[3] Indeed, we have confirmed the fact that 'there is a return of the mind in dreams to an embryonic point of view'.[4]

We have entered so closely, in connection with the processes of condensation, into the importance of the analogy between jokes and dreams that we may be briefer in what follows. As we know, the displacements in the dream-work point to the operation of the censorship of conscious thinking, and accordingly, when we come across displacement among the techniques of jokes, we shall be inclined to suppose that an inhibitory force [*eine hemmende Macht*] plays a part in the formation of jokes as well. And we already know that this is quite generally the case. The effort made by jokes to recover the old pleasure in nonsense or the old pleasure in words finds itself inhibited in normal moods by objections raised by critical reason; and in every individual case this has to be overcome. But the manner in which the joke-work accomplishes this

1 Many of my neurotic patients who are under psychoanalytic treatment are regularly in the habit of confirming the fact by a laugh when I have succeeded in giving a faithful picture of their hidden unconscious to their conscious perception; and they laugh even when the content of what is unveiled would by no means justify this. This is subject, of course, to their having arrived close enough to the unconscious material to grasp it after the doctor has detected it and presented it to them.

2 [W. Griesinger (1817–68) had pointed out the wish-fulfilling character of both dreams and psychoses. One particular passage of his (Griesinger, 1845, 89) is referred to several times by Freud. See an Editors' footnote to Freud's paper on the 'Two Principles of Mental Functioning' (1911*b*), *RSE*, **12**, 215 *n.* 3.]

3 In doing so we should not forget to take into account the distortion due to the censorship which is still at work even in psychoses.

4 *The Interpretation of Dreams* (1900*a*). [Ibid., **5**, 529. The phrase occurs there as a quotation; but its source is not specified.]

task shows a sweeping distinction between jokes and dreams. In the dream-work it is habitually accomplished by displacements, by the selection of ideas which are sufficiently remote from the objectionable one for the censorship to allow them to pass, but which are nevertheless derivatives of that idea and have taken over its psychical cathexis by means of a complete transference.[1] For this reason displacements are never absent in a dream and are far more comprehensive.

Among displacements are to be counted not merely diversions from a train of thought but every sort of indirect representation as well, and in particular the replacement of an important but objectionable element by one that is indifferent and that appears innocent to the censorship, something that seems like a very remote allusion to the other one – substitution by a piece of symbolism, or an analogy, or something small. It cannot be disputed that portions of such indirect representation are already present in the dream's preconscious thoughts – for instance, representation by symbols or analogies – because otherwise the thought would not have reached the stage of preconscious expression at all. [172]
Indirect representations of this kind, and allusions whose reference to the thing intended is easy to discover, are indeed permissible and much-used methods of expression in our conscious thinking as well. The dream-work, however, exaggerates this method of indirect expression beyond all bounds. Under the pressure of the censorship, any sort of connection is good enough to serve as a substitute by allusion, and displacement is allowed from any element to any other. Replacement of internal associations (similarity, causal connection, etc.) by what are known as external ones (simultaneity in time, contiguity in space, similarity of sound) is quite specially striking and characteristic of the dream-work.

All these methods of displacement appear too as techniques of joking. But when they appear, they usually respect the limits imposed on their employment in conscious thinking; and they may be altogether absent, although jokes too have invariably a task to accomplish of dealing with an inhibition. We can understand the subordinate place taken by displacements in the joke-work when we recall that jokes always have another technique at their command for keeping off inhibition and indeed that we have found nothing more characteristic of them than precisely this technique. For jokes do not, like dreams, create compromises; they do not evade the inhibition, but they insist on maintaining play with words or with nonsense unaltered. They restrict themselves,

1 ['Transference' [*Übertragung*]^{T} is not, of course, used here in the commoner sense in which it is used of a phenomenon in psychotherapy, but the sense is also not entirely unrelated. See an Editors' footnote to Chapter VII (C) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 503 *n.* 2.]

however, to a choice of occasions in which this play or this nonsense can at the same time appear allowable (in jests) or sensible (in jokes), thanks to the ambiguity of words and the multiplicity of conceptual relations. Nothing distinguishes jokes more clearly from all other psychical structures than this double-sidedness and this duplicity in speech. From this point of view at least the authorities come closest to an understanding of the nature of jokes when they lay stress on 'sense in nonsense' [p. 11 f. above].

In view of the universal predominance in jokes of this peculiar technique for overcoming their inhibitions, it might be thought superfluous for them ever to make use in particular cases of the technique of displacement. But, on the one hand, certain species of that technique remain of value to jokes as aims and as sources of pleasure – for instance, displacement proper (diversion of thoughts), which indeed partakes of the
[173] nature of nonsense. On the other hand, it should not be forgotten that the highest stage of jokes, tendentious jokes, often have to overcome two kinds of inhibition, those opposed to the joke itself and those opposed to its purpose (p. 88 f.), and that allusions and displacements are well qualified to make this latter task possible.

The abundant and unrestrained use in the dream-work of indirect representation, of displacements, and especially of allusions, has a result which I mention not for its own importance but because it became my subjective reason for taking up the problem of jokes. If one gives an account to an uninformed or unaccustomed person of a dream analysis, in which are set out, therefore, the strange processes of allusions and displacements – processes so obnoxious to waking life – of which the dream-work has made use, the reader receives an uncomfortable impression and declares that these interpretations are 'in the nature of a joke'. But he clearly does not regard them as *successful* jokes, but as forced, and in some way violating the rules of jokes. It is easy to explain this impression. It arises from the fact that the dream-work operates by the same methods as jokes, but in its use of them it transgresses the limits that are respected by jokes.[1] We shall presently [p. 155 f.] learn that, as a result

1 [The gist of this passage had already been included by Freud in a footnote in the first edition of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 265 *n*. The question had in fact been raised by Fliess, who had read the book in proof, and Freud replied to it in very much the same terms as those used above in a letter to him of September 11, 1899 (Freud, 1950*a*, Letter 118). It may be noted that, in the *Revised Standard Edition* translation of the footnote here referred to, the German word '*witzig*' is rendered by 'ingenious and amusing'. In the present volume (as, for instance, in the passage in the text above) it is often rendered 'in the nature of a joke'. Cf. the Editors' Preface, p. 6 above.]

of the part played by the third person, jokes are bound by a certain condition which does not apply to dreams.

Among the techniques common to jokes and dreams, representation by the opposite and the use of nonsense claim some amount of our interest. The former is one of the more effective methods employed in jokes, as may be seen among others by the examples of 'overstatement jokes' (p. 63 f.). Incidentally, representation by the opposite is not able, like most other joke techniques, to escape conscious attention. A person who [174]
tries to bring the joke-work into operation in himself as deliberately as possible – a professional wag – soon discovers as a rule that the easiest way of replying to an assertion by a joke is by asserting its contrary and by leaving it to the inspiration of the moment to get rid of the objection which his contradiction is likely to provoke, by giving what he has said a fresh interpretation. It may be that representation by the opposite owes the favour it enjoys to the fact that it forms the core of another pleasurable way of expressing a thought, which can be understood without any need for bringing in the unconscious. I am thinking of *irony*, which comes very close to joking [see p. 64 above] and is counted among the subspecies of the comic. Its essence lies in saying the opposite of what one intends to convey to the other person, but in sparing him contradiction by making him understand – by one's tone of voice, by some accompanying gesture or (where writing is concerned) by some small stylistic indications – that one means the opposite of what one says. Irony can only be employed when the other person is prepared to hear the opposite, so that he cannot fail to feel an inclination to contradict. As a result of this condition, irony is exposed particularly easily to the danger of being misunderstood. It brings the person who uses it the advantage of enabling him readily to evade the difficulties of direct expression, for instance in invectives. It produces comic pleasure in the hearer, probably because it stirs him into a contradictory expenditure of energy which is at once recognized as being unnecessary. A comparison like this between jokes and a closely related type of the comic may confirm our assumption that what is peculiar to jokes is their relation to the unconscious and that this may perhaps distinguish them from the comic as well.[1]

In the dream-work, representation by the opposite plays a far greater part even than in jokes. Dreams are not merely fond of representing two

1 The characteristic of the comic which is described as its 'dryness' depends likewise on the distinction between a statement and the gestures (in the widest sense of the word) accompanying it.

contraries by one and the same composite structure, but they so often change something in the dream thoughts into its opposite that this leads to a great difficulty in the work of interpretation. 'There is no way of deciding at first glance whether any element that admits of a contrary is
[175] present in the dream thoughts as a positive or as a negative.'[1]

I must state emphatically that this fact has not up to now met with any recognition. But it seems to point to an important characteristic of unconscious thinking, in which in all probability no process that resembles 'judging' occurs. In the place of rejection by a judgement, what we find in the unconscious is 'repression'. Repression may, without doubt, be correctly described as the intermediate stage between a defensive reflex and a condemning judgement.[2]

Nonsense, absurdity, which appears so often in dreams and has brought them into so much undeserved contempt, never arises by chance through the ideational elements being jumbled together, but can always be shown to have been admitted by the dream-work intentionally and to be designed to represent embittered criticism and contemptuous contradiction in the dream thoughts. Thus the absurdity in the content of the dream takes the place of the judgement 'this is a piece of nonsense' in the dream thoughts.[3] I laid great stress on the evidence of this in my *Interpretation of Dreams* because I thought that in this way I could make the most forcible attack on the error of believing that the dream is not a psychical phenomenon at all – an error which blocks the way to a knowledge of the unconscious. We have now learnt, in the course of solving certain tendentious jokes (p. 50 ff.), that nonsense in jokes is made to serve the same aims of representation. We know too that a senseless façade to a joke is particularly well suited to increase the hearer's psych-
[176] ical expenditure and so to raise the quota liberated for discharge by laughing [p. 132 f.]. But besides this, it must not be forgotten that the nonsense in a joke is an end in itself, since the intention of recovering the old pleasure in nonsense is among the joke-work's motives. There are

1 *The Interpretation of Dreams* [(1900*a*), *RSE*, **4**, 283–4].

2 The highly remarkable and still insufficiently appreciated behaviour of the relation between contraries in the unconscious is no doubt likely to help our understanding of 'negativism' in neurotic and insane patients. (Cf. the two last works on the subject: Bleuler, 1904, and Gross, 1904. [*Added* 1912:] See also my review of 'The Antithetical Meaning of Primal Words' (1910*e*).) – [The statement that repression is an earlier form of a negative judgement seems to occur here for the first time. It is often repeated later (e.g. in the paper on the two principles of mental functioning (1911*b*), *RSE*, **12**, 217, and in Section V of the metapsychological paper on 'The Unconscious' (1915*e*), ibid., **14**, 164), and the whole question is discussed more fully in the much later paper on 'Negation' (1925*h*), ibid., **19**, 238.]

3 [Cf. the first part of Section G of Chapter VI of *The Interpretation of Dreams*, ibid., **5**, 380 ff.]

other ways of recovering the nonsense and of deriving pleasure from it: caricature, exaggeration, parody and travesty make use of them and so create 'comic nonsense'. If we submit these forms of expression to an analysis similar to the one we have applied to jokes, we shall find that in none of these cases is there any occasion for bringing in unconscious processes in our sense in order to explain them. We can now understand too how it is that the characteristic of being a joke can come as an extra addition to a caricature, exaggeration or parody; what makes this possible is a difference in the 'psychical scene of action'.[1]

The assignment of the joke-work to the system of the unconscious has, I think, become of considerably greater importance to us now that it has enabled us to understand the fact that the techniques to which jokes admittedly cling are, on the other hand, not their exclusive property. Some doubts which we were obliged to hold over until later in our original examination of these techniques now find a comfortable solution.[2] For that very reason another doubt that arises is all the more deserving of our consideration. This suggests that the undeniable relation of jokes to the unconscious is in fact only valid for certain categories of tendentious jokes, whereas *we* are prepared to extend it to every species and every developmental stage of jokes. We must not evade an examination of this objection.

It can be assumed with certainty that jokes are formed in the unconscious when it is a question of jokes in the service of unconscious purposes or of purposes reinforced by the unconscious – that is, of most 'cynical' jokes [p. 100 above]. For in such cases the unconscious purpose drags the preconscious thought down into the unconscious and there gives it a new shape – a process to which the study of the psychology of [177]
the neuroses has taught us numerous analogies. In the case, however, of tendentious jokes of other kinds, of innocent jokes and of jests, this downward-dragging force seems absent and the relation of jokes to the unconscious is accordingly called in question.

But let us now consider the case in which a thought, not worthless in itself, arises in the course of a train of thought and is expressed as a joke. In order to enable this thought to be turned into a joke, it is clearly necessary to select from among the possible forms of expression the

1 An expression used by Fechner [1889, **2**, 520–1] which has acquired importance as a support for my views. [Fechner's idea that 'the scene of action of dreams is different from that of waking ideational life' had been quoted by Freud in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 478, as supporting the topographical distinction between unconscious and preconscious mental processes.]

2 [See, for instance, pp. 53 f. and 71 f. above.]

precise one which brings along with it a yield of verbal pleasure. We know from self-observation that this selection is not made by conscious attention; but it will certainly help the selection if the cathexis of the preconscious thought is reduced to an unconscious one, for, as we have learnt from the dream-work, the connecting paths which start out from *words* are in the unconscious treated in the same way as connections between *things*. An unconscious cathexis offers far more favourable conditions for selecting the expression. Moreover, we can immediately assume that the possible form of expression that involves a yield of verbal pleasure exercises the same downward drag on the still unsettled wording of the preconscious thought as did the unconscious purpose in the earlier case. To meet the simpler case of the jest, we may suppose that an intention which is all the time on the look-out to achieve a yield of verbal pleasure grasps the occasion offered in the preconscious for dragging the cathectic process down into the unconscious according to the familiar pattern.

I should be very glad if it were possible for me on the one hand to give a clearer exposition of this single decisive point in my view of jokes and on the other hand to reinforce it with conclusive arguments. But in fact what I am faced with here is not a twofold failure but one and the same failure. I cannot give a clearer exposition because I have no further proof of my view. I arrived at it on the basis of a study of the technique [of jokes] and of a comparison with the dream-work, and on no other basis; and I then found that on the whole it fits in excellently with the characteristics of jokes. Thus this view has been arrived at by inference; and if from an inference of this kind one is led, not to a familiar region, but on the contrary, to one that is alien and new to one's thought, one calls the
[178] inference a 'hypothesis' and rightly refuses to regard the relation of the hypothesis to the material from which it was inferred as a 'proof' of it. It can only be regarded as 'proved' if it is reached by another path as well and if it can be shown to be the nodal point of still other connections. But proof of this sort is not to be had, in view of the fact that our knowledge of unconscious processes has scarcely begun. In the realization that we are standing upon ground which has never before been trodden, we are thus content, from our point of observation, to take one single, short and uncertain step forward into the unexplored region.

On such a foundation we cannot build a great deal. If we bring the various stages of the joke into relation to the mental states that are favourable to them we can perhaps proceed as follows. The *jest* springs from a cheerful mood, which seems to be characterized by an inclination

to diminish mental cathexes. It already employs all the characteristic techniques of jokes and already fulfils their fundamental condition by selecting verbal material or connections of thoughts which will meet both the demands for a yield of pleasure and those made by rational criticism. We shall conclude that the lowering of the thought cathexis to the unconscious level, facilitated by the cheerful mood, is present already in jests. In the case of *innocent jokes* that are linked to the expression of a valuable thought, the encouraging effect of mood no longer applies. Here we must presume the occurrence of a special *personal aptitude*, which is manifested in the ease with which the preconscious cathexis is dropped and exchanged for a moment for the unconscious one. A purpose that is all the time on the watch for renewing the original yield of pleasure from jokes exercises a downward drag on the still unsettled preconscious expression of the thought. No doubt most people are capable of producing jests when they are in a cheerful mood; the aptitude for making *jokes* is present in only a few people independently of their mood. Lastly, the joke-work receives its most powerful stimulus when strong purposes reaching down into the unconscious are present, which represent a special aptitude for the production of jokes and which may explain to us how it is that the subjective determinants of jokes are so often fulfilled in neurotic people. Under the influence of strong purposes even those who otherwise have the least aptitude for it become capable of making jokes.

With this last contribution, however, which explains, even though still only hypothetically, the joke-work in the first person, our interest in jokes is, strictly speaking, at an end. It remains for us to make a further short comparison between jokes and the better-known dream; and we may expect that, apart from the single conformity we have already considered, two such dissimilar mental functions will only reveal differences. The most important difference lies in their social behaviour. A dream is a completely asocial mental product; it has nothing to communicate to anyone else; it arises within the subject as a compromise between the mental forces struggling in him, it remains unintelligible to the subject himself and is for that reason totally uninteresting to other people. Not only does it not need to set any store by intelligibility, it must actually avoid being understood, for otherwise it would be destroyed; it can only exist in masquerade. For that reason it can without hindrance make use of the mechanism that dominates unconscious mental processes, to the point of a distortion which can no longer be set straight. A joke, on the other hand, is the most social of all the mental functions that aim at a [179]

yield of pleasure. It often calls for three persons and its completion requires the participation of someone else in the mental process it starts. The condition of intelligibility is, therefore, binding on it; it may only make use of possible distortion in the unconscious through condensation and displacement up to the point at which it can be set straight by the third person's understanding. Moreover, jokes and dreams have grown up in quite different regions of mental life and must be allotted to points in the psychological system far remote from each other. A dream still remains a wish, even though one that has been made unrecognizable; a joke is developed play. Dreams, in spite of all their practical nonentity, retain their connection with the major interests of life; they seek to fulfil needs by the regressive detour of hallucination, and they are permitted to occur for the sake of the one need that is active during the night – the need to sleep. Jokes, on the other hand, seek to gain a small yield of pleasure from the mere activity, untrammelled by needs, of our mental apparatus. Later they try to catch hold of that pleasure as a by-product during the activity of that apparatus and thus arrive *secondarily* at not
[180] unimportant functions directed to the external world. Dreams serve predominantly for the avoidance of unpleasure, jokes for the attainment of pleasure; but all our mental activities converge in these two aims.

VII
JOKES AND THE SPECIES OF THE COMIC

[1]

We have approached the problems of the comic in an unusual way. It [181]
seemed to us that jokes, which are ordinarily regarded as a subspecies of the comic, offer enough peculiarities to be attacked directly; thus we have avoided their relation to the more inclusive category of the comic so long as that was possible, though we have not failed to pick out *en passant* a few hints that might throw light on the comic. We have had no difficulty in discovering that socially the comic behaves differently from jokes [p. 125 f. above]. It can be content with two persons: a first who finds what is comic and a second in whom it is found. The third person, to whom the comic thing is told, intensifies the comic process but adds nothing new to it. In a joke this third person is indispensable for the completion of the pleasure-producing process; but on the other hand the second person may be absent, except where a tendentious, aggressive joke is concerned. A joke is made, the comic is found – and first and foremost in people, only by a subsequent transference in things, situations, and so on, as well. As regards jokes, we know that the sources of the pleasure that is to be fostered lie in the subject himself and not in outside people. We have seen, too, that jokes can sometimes reopen sources of the comic which have become inaccessible [p. 90 f.], and that the comic often serves as a façade for a joke and replaces the fore-pleasure which has otherwise to be produced by the familiar technique (p. 133). None of this precisely suggests that the relations between jokes and the comic are very simple. On the other hand, the problems of the comic have proved so complicated and all the efforts of the philosophers at solving them have been so unsuccessful that we cannot hold out any prospect that we shall be able to master them in a sudden onslaught, as it were, by approaching them from the direction of jokes. Moreover, for our investigation of jokes we brought with us an instrument of which no-one else had hitherto made use – a knowledge of the dream-work. We have no similar advantage at our command to help us to understand [182]
the comic, and we must therefore expect that we shall discover no more about the nature of the comic than what we have already found in jokes, insofar as they form part of the comic and possess in their own nature certain of its features unchanged or merely modified.

The type of the comic which stands nearest to jokes is the naive. Like the comic in general, the naive is 'found' and not, like a joke, 'made'. Indeed, the naive cannot be made at all, whereas alongside the pure comic we have to take into account the case in which something is made comic – an evocation of the comic. The naive must arise, without our taking any part in it, in the remarks and actions of other people, who stand in the position of the *second* person in the comic or in jokes. The naive occurs if someone completely disregards an inhibition because it is not present in him – if, therefore, he appears to overcome it without any effort. It is a condition for the naive's producing its effect that we should know that the person concerned does not possess the inhibition; otherwise we call him not naive but impudent. We do not laugh at him but are indignant at him. The effect produced by the naive is irresistible, and seems simple to understand. An inhibitory expenditure which we usually make suddenly becomes unutilizable owing to our hearing the naive remark, and it is discharged by laughter. There is no need here for the attention to be distracted [p. 132 above], probably because the lifting of the inhibition occurs directly and not through the intermediary of an operation that has been provoked. In this we are behaving like the third person in a joke, who is presented with the economy in inhibition without any effort on his own part [p. 129].

In view of the insight we have gained into the genesis of inhibitions from following the course of development from play to jokes, it will not surprise us to find that the naive occurs far the most often in children, and is then carried over to uneducated adults, whom we may regard as childish so far as their intellectual development is concerned. Naive *remarks* are, of course, better suited for comparison with jokes than naive actions, since remarks and not actions are the usual form in which
[183] jokes are expressed. It is illuminating to find that naive remarks like those made by children may also be described as 'naive jokes'. The conformity between jokes and naivety, as well as the reasons for their dissimilarity, will be made clearer to us by a few examples.

A three-and-a-half-year-old girl[1] gave this warning to her brother: 'I say, don't eat so much of that pudding or you'll get ill and have to have some "*Bubizin*".' '"*Bubizin*"?' asked her mother, 'What's that?' 'When I was ill', answered the child in self-justification, 'I had to have some *Medizin*.' The child thought that what the doctor prescribed was called

1 [Ilse Grubrich-Simitis (1993, 152 f.; trans., 114 f.) discovered among Freud's unpublished notes a slip of paper recording the actual events of this example a few weeks after they had occurred (at Strakowitz in Bohemia). Freud evidently forgot the existence of this note as it shows various discrepancies with the published version – although the essential structure of the 'joke' is preserved.]

'*Mädi-zin*' when it was for a '*Mädi*' [little girl] and concluded that if it was for a '*Bubi*' [little boy] it would be called '*Bubi-zin*'. This is constructed like a verbal joke working with the technique of similarity of sound, and indeed it might have occurred as a real joke, in which case we should have greeted it, half-unwillingly, with a smile. As an example of naivety it strikes us as quite excellent and it raises a laugh. What is it that makes the difference here between a joke and something naive? Evidently not the wording or the technique, which would be the same for both possibilities, but a factor, rather, which at first sight seems quite remote from both of them. It is merely a question of whether we assume that the speaker has intended to make a joke or whether we suppose that she – the child – has tried in good faith to draw a serious conclusion on the basis of her uncorrected ignorance. Only the latter case is one of naivety. Here for the first time our attention is drawn to the other person putting himself into the psychical process that occurs in the person who produces the remark.

This view will be confirmed if we examine another example. A brother and sister – a twelve-year-old girl and a ten-year-old boy – were performing a drama composed by themselves before an audience of uncles and aunts. The scene represented a hut by the seashore. In the first act the two author-actors, a poor fisherman and his honest wife, are complaining about the hard times and their small earnings. The husband decides to cross the wide seas in his boat to seek his fortune elsewhere, and, after tender farewells between the two of them, the curtain falls. The second act takes place a few years later. The fisherman has returned a wealthy man with a big bag of money; and he tells his wife, who awaits his arrival outside the hut, what good fortune he has met with in foreign lands. His wife interrupts him proudly: 'I too have not been idle.' And thereupon [184]
she opens the door of the hut and reveals to his eyes twelve large dolls lying asleep on the floor. . . . At this point in the drama the actors were interrupted by a storm of laughter from the audience, which they were unable to understand. They stared disconcerted at their fond relatives, who had behaved properly till then and had listened with eager attention. The laughter is explained on the supposition that the audience assumed that the young authors still knew nothing of the conditions governing the origin of children and were therefore able to believe that a wife could boast of the offspring born during her husband's long absence and that a husband could rejoice with her over them. What the authors produced on the basis of this ignorance might be described as nonsense or absurdity.[1]

1 [This anecdote is told, with a different setting, of the children of the 1st Earl of Lytton. Cf. G. W. E. Russell's *Collections and Recollections*, 1898, Chapter 32.]

A third example will show us yet another technique, the acquaintance of which we have made in jokes, in the service of the naive. A 'Frenchwoman'[1] was engaged as governess for a little girl, but did not meet with her personal approval. Scarcely had the newcomer left the room when the little girl gave voice to loud criticism: '*That* a Frenchwoman? She may *call* herself one because she once lay beside a Frenchman!' This might have been a joke – even a tolerably good one – (double meaning or allusion, with *double entendre*) if the child had had the slightest notion of the possibility of the double meaning. In fact, she had merely transferred to the stranger she disliked a facetious way of describing a thing as ungenuine which she had often heard: '*That* genuine gold? It may once have lain beside gold.' Owing to the child's ignorance, which so completely altered the psychical process in her understanding hearers, her remark became a naive one. In consequence of this condition [that the child must really be ignorant], there is the possibility of a *misleading naivety*. We may assume in the child an ignorance that no longer exists; and children often represent themselves as naive, so as to enjoy a liberty that they would not otherwise be granted.

[185] We can illustrate from these examples the position occupied by the naive between jokes and the comic. The naive (in speech) agrees with jokes as regards wording and content: it brings about a misuse of words, a piece of nonsense or a piece of smut. But the psychical process in the first person, who produces it, which raised so many interesting and puzzling questions for us in regard to jokes, is here completely absent. A naive person thinks he has used his means of expression and trains of thought normally and simply, and he has no *arrière pensée* in mind; nor does he derive any yield of pleasure from producing something naive. None of the characteristics of the naive exists except in the apprehension of the person who hears it – a person who coincides with the third person in jokes. Moreover, the person who produces it does so without any effort. The complicated technique, which in jokes is designed to paralyse the inhibition arising from rational criticism, is absent in him; he does not possess this inhibition as yet, so that he can produce nonsense and smut directly and without compromise. In that respect the naive is a marginal case of the joke; it arises if in the formula for the construction of jokes we reduce the value of the censorship to zero.

Whereas it was a condition for the effectiveness of a joke that both persons should be subject to approximately the same inhibitions or

1 ['*Französin*.' The ordinary term for a French governess in Austria.]

internal resistances [p. 131 above], it will be seen that it is a condition for the naive that the one person should possess inhibitions which the other is without. The apprehension of the naive lies with the person provided with inhibitions, and he alone obtains the yield of pleasure which the naive brings about. We have come near to guessing that that pleasure arises from the lifting of inhibitions. Since the pleasure from jokes has the same origin – a core of verbal pleasure and pleasure from nonsense, and a casing of pleasure in the lifting of inhibitions or in the relief of psychical expenditure [p. 121 *n.*] – this similar relation to inhibition explains the internal kinship between the naive and jokes. In both of them the pleasure arises through the lifting of internal inhibition.

The psychical process in the receptive person, however, is as much more complicated in the case of the naive as it is simplified in comparison with jokes in the productive person. (In the case of the naive, incidentally, our own self invariably coincides with the receptive person, while in the case of jokes we may equally occupy the position of the [186]
productive one.) When the receptive person hears something naive, it must on the one hand affect him like a joke – and our examples give evidence precisely of this – for, as with a joke, the lifting of the censorship is made possible for him by no more than the effort of listening. But only a part of the pleasure created by the naive can be explained in this way; and even this might be endangered in certain instances – for example, at hearing a naive piece of smut. We might react to this at once with the same indignation that might be felt against a real piece of smut, if it were not that another factor spares us this indignation and at the same time offers us the more important part of our pleasure in the naive. This other factor is the condition already mentioned [p. 158] that, in order to recognize the naive, we must know that the internal inhibition is absent in the producing person. Only when this is certain do we laugh instead of being indignant. Thus we take the producing person's psychical state into consideration, put ourselves into it and try to understand it by comparing it with our own. It is these processes of empathy [*Sichhineinversetzen*] and comparison that result in the economy in expenditure which we discharge by laughing.

It would be possible to prefer a simpler account – that our indignation is made superfluous by the fact that the other person has had no need to overcome a resistance; in that case the laughter would occur at the cost of the economy in indignation. In order to discourage this view, which is on the whole misleading, I will make a sharper distinction between two cases which I have treated together above. The naive

which we come across can either be in the nature of a joke, as it was in our examples, or in the nature of smut (or of what is in general objectionable); and the latter will occur especially when it is expressed not in speech but in action. This second alternative is really misleading: one could suppose, as far as it is concerned, that the pleasure arises from the economized and transformed indignation. But the first alternative throws more light on things. A naive remark – e.g. '*Bubizin*' [p. 158 f. above] – can in itself act like a minor joke and give no cause for indignation. This alternative is certainly the less frequent; but it is the purer and by far the more instructive. Insofar as what we are concerned with is the fact that the child has seriously and without *arrière pensée*
[187] believed that the syllable '*Medi*' in '*Medizin*' is identical to her own name '*Mädi*', our pleasure in what we hear receives an increase which has no longer anything to do with pleasure in a joke. We now look at what has been said from two points of view – once in the way it happened in the child and once in the way it would have happened to us; and in making this comparison we see that the child has found an identity[1] and that she has overcome a barrier that exists for us; and we then seem to go further and say to ourselves: 'If you choose to understand what you've heard, you can economize the expenditure on keeping up this barrier.' The expenditure liberated in a comparison like this is the source of pleasure in the naive and it is discharged by laughter; and it is, incidentally, the same pleasure that we should otherwise have transformed into indignation, if this had not been excluded by our understanding of the producing person and, in this case, by the nature of what was said as well. But if we take the instance of a naive joke as a model of the other alternative, of something naive that is objectionable, we shall see that there too the economy in inhibition can arise directly from the comparison, that there is no necessity for us to assume an indignation that begins and is then stifled, and that this indignation in fact only corresponds to using the liberated expenditure in another way – against which in the case of jokes complicated protective arrangements were necessary [p. 131 f.].

This comparison, and this economy in expenditure by putting oneself into [*Sichhineinversetzen*] the mental process of the producing person, can only claim to be of significance for the naive, however, if it is not in it alone that they are found. A suspicion occurs to us, in fact, that this mechanism, which is wholly alien to jokes, may be a part and perhaps an essential part of the psychical process in the comic. Looked at from this

1 [I.e. the identity between *Medi* and *Mädi*.]

point of view – and this is undoubtedly the most important aspect of the naive – the naive thus presents itself as a species of the comic. The extra element in our examples of naive speeches that is added to the pleasure of a joke is 'comic' pleasure. We should be inclined to assume of it quite generally that it arises from expenditure economized in a comparison of someone else's remarks with our own. But since this leads us to far-reaching considerations, we will first conclude our discussion of the [188]
naive. The naive, then, would be a species of the comic insofar as its pleasure springs from the difference[1] in expenditure which arises in trying to understand someone else; and it would approach the joke in being subject to the condition that the expenditure economized in the comparison must be an inhibitory expenditure.[2]

Let us hastily add a few points of agreement and of difference between the concepts that we have just reached and those which have long been familiar in the psychology of the comic. The putting of oneself in the other person's place [*Sichhineinversetzen*] and trying to understand him is clearly nothing other than the 'comic lending' which since Jean Paul has played a part in the analysis of the comic; the 'comparing' of someone else's mental process with one's own corresponds to the 'psychological contrast' which we can at last find a place for here, after not knowing what to do with it in jokes [p. 11 f. above]. But we differ in our explanation of comic pleasure from many authorities who regard it as arising from the oscillation of attention backwards and forwards between contrasting ideas. A mechanism of pleasure like this would seem incomprehensible to us;[3] but we may point out that in a comparison between contrasts a difference in expenditure occurs which, if it is not used for some other purpose, becomes capable of discharge and may thus become a source of pleasure.

It is only with misgivings that I venture to approach the problem of the comic itself. It would be presumptuous to expect that my efforts would

1 [The German word here (and regularly in this connection throughout the rest of the book) is '*Differenz*', not the usual '*Unterschied*'. It is the term used in mathematics and means a *quantitative* not a qualitative difference. The English word has to cover both meanings.]

2 In what I have written, I have all the time identified the naive with the naive-comic, which is certainly not in every case admissible. But it is enough for our purposes to study the character of the naive in 'naive jokes' and in 'naive smut'. Any further investigation would imply an intention on my part of using this as a basis for my explanation of the comic.

3 Bergson, too, rejects the idea of comic pleasure having any such derivation, which is evidently influenced by an effort to establish an analogy with the laughter caused by tickling; and he supports his view with some good arguments (1900, 99). – The explanation of comic pleasure given by Lipps is on a quite different plane: in accordance with his view of the comic, he would regard it as something that is 'unexpectedly small'. [In the German this footnote is attached at the *end* of the paragraph.]

[189] be able to make any decisive contribution to its solution when the works of a great number of eminent thinkers have failed to produce a wholly satisfactory explanation. My intention is in fact no more than to pursue the lines of thought that have proved valuable with jokes a short distance further into the sphere of the comic.

The comic arises in the first instance as an unintended discovery derived from human social relations. It is found in people – in their movements, forms, actions and traits of character, originally in all probability only in their physical characteristics but later in their mental ones as well or, as the case may be, in the expression of those characteristics. By means of a very common sort of personification, animals become comic too, and inanimate objects. At the same time, the comic is capable of being detached from people, insofar as we recognize the conditions under which a person seems comic. In this way the comic of situation comes about, and this recognition affords the possibility of making a person comic at one's will by putting him in situations in which his actions are subject to these comic conditions. The discovery that one has it in one's power to make someone else comic opens the way to an undreamt-of yield of comic pleasure and is the origin of a highly developed technique. One can make *oneself* comic, too, as easily as other people. The methods that serve to make people comic are: putting them in a comic situation, mimicry, disguise, unmasking, caricature, parody, travesty, and so on. It is obvious that these techniques can be used to serve hostile and aggressive purposes. One can make a person comic in order to make him become contemptible, to deprive him of his claim to dignity and authority. But even if such an intention habitually underlies making people comic, this need not be the meaning of what is comic spontaneously.

This haphazard[1] survey of the occurrences of the comic will already show us that a very extensive field of origin is to be ascribed to it and that such specialized conditions as we found, for instance, in the naive are not to be expected in it. In order to get on the track of the determining condition that is valid for the comic, the most important thing is the choice of an introductory case. We shall choose the comic of movement,
[190] because we recollect that the most primitive kind of stage performance – the pantomime – uses that method for making us laugh. The answer to the question of why we laugh at the clown's movements is that they seem to us extravagant and inexpedient. We are laughing at an expenditure that is too large. Let us look now for the determining

1 ['*Ungeordneten*.' In 1912 only, this was misprinted '*untergeordneten*', 'secondary'.]

condition outside the comic that is artificially constructed – where it can be found unintended. A child's movements do not seem to us comic, although he kicks and jumps about. On the other hand, it *is* comic when a child who is learning to write follows the movements of his pen with his tongue stuck out; in these associated movements we see an unnecessary expenditure of movement which we should spare ourselves if we were carrying out the same activity. Similarly, other such associated movements, or merely exaggerated expressive movements, seem to us comic in adults too. Pure examples of this species of the comic are to be seen, for instance, in the movements of someone playing skittles who, after he has released the ball, follows its course as though he could still continue to direct it [*noch nachträglich regulieren*]. Thus, too, all grimaces are comic which exaggerate the normal expression of the emotions, even if they are produced involuntarily as in sufferers from St Vitus's dance (chorea). And in the same way, the passionate movements of a modern conductor seem comic to any unmusical person who cannot understand their necessity. Indeed, it is from this comic of movement that the comic of bodily shapes and facial features branches off; for these are regarded as though they were the outcome of an exaggerated or pointless movement. Staring eyes, a hooked nose hanging down to the mouth, ears sticking out, a humpback – all such things probably only produce a comic effect insofar as movements are imagined which would be necessary to bring about these features; and here the nose, the ears and other parts of the body are imagined as more movable than they are in reality. There is no doubt that it is comic if someone can 'waggle his ears', and it would certainly be still more comic if he could move his nose up and down. A good deal of the comic effect produced on us by animals comes from our perceiving in them movements such as these which we cannot imitate ourselves.

But how is it that we laugh when we have recognized that some other person's movements are exaggerated and inexpedient? By making a [191]
comparison, I believe, between the movement I observe in the other person and the one that I should have carried out myself in his place. The two things compared must of course be judged by the same standard, and this standard is my expenditure of innervation, which is linked to my idea [*Vorstellung*] of the movement in both of the two cases. This statement calls for elucidation and expansion.

What we are here comparing is, on the one hand, the psychical expenditure while we are having a certain idea and, on the other hand, the content of the thing that we are having the idea of. Our statement

says that the former is not in general and in theory independent of the latter, the content of the idea, and in particular that the idea of something large demands more expenditure than the idea of something small. So long as it is only a matter of the idea of different large *movements*, there should be no difficulties over the theoretical grounds for our statement or over proving it by observation. We shall see that in this case an attribute of the idea in fact coincides with an attribute of what we have an idea of, though psychology warns us as a rule against such a confusion.

I have acquired the idea of a movement of a particular size by carrying the movement out myself or by imitating it, and through this action I have learnt a standard for this movement in my innervatory sensations.[1]

When, now, I perceive a movement like this of greater or lesser size in someone else, the securest way to an understanding (an apperception) of it will be for me to carry it out by imitation, and I can then decide from the comparison on which of the movements my expenditure was the greater. An impulsion of this kind to imitation is undoubtedly present in perceptions of movements. But actually I do not carry the imitation through, any more than I still spell words out if I learnt to read by spelling. Instead of imitating the movement with my muscles, I have an idea [192] of it through the medium of my memory traces of expenditures on similar movements. Ideation or 'thinking' differs from acting or performing above all in the fact that it displaces far smaller cathectic energies and holds back the main expenditure from discharge.[2]

But how is the *quantitative* factor – the greater or lesser size – of the perceived movement to be given expression in the idea? And if there can be no representation of quantity in the idea, which is made up of qualities, how can I distinguish the ideas of movements of different sizes? – how can I make the comparison on which everything here depends? The way is pointed out by physiology, for it teaches us that even during the process of ideation innervations run out to the muscles, though these, it is true, correspond to a very modest expenditure of

1 The memory of this innervatory expenditure will remain the essential part of my idea of this movement, and there will always be modes of thinking in my mental life in which the idea will be represented by nothing else than this expenditure. In other circumstances, indeed, this element may be replaced by another – for instance, by visual images of the aim of the movement or by a verbal image; and in certain kinds of abstract thinking a token will suffice instead of the full content of the idea.

2 [This important principle had been expressed by Freud in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 536–7, though perhaps less clearly than here. He had discussed it earlier (in 1895) in quasi-neurological terms in Section 18 of Part I of his posthumously published 'Project' (1950*a*), ibid., **1**. The point is once more brought out very plainly in the paper on 'The Two Principles of Mental Functioning' (1911*b*), ibid., **12**, 218, and recurs in many later passages – e.g. in Lecture XXXII of the *New Introductory Lectures* (1933*a*), ibid., **22**.]

energy.[1] Now it becomes very plausible to suppose that this innervatory energy that accompanies the process of ideation is used to represent the quantitative factor of the idea: that it is larger when there is an idea of a large movement than when it is a question of a small one. Thus the idea of the larger movement would in this case in fact be the larger one – that is, it would be the idea accompanied by the larger expenditure of energy.

Direct observation shows that human beings are in the habit of expressing the attributes of largeness and smallness in the contents of their ideas by means of a varying expenditure in a kind of *ideational mimetics* [*Vorstellungsmimik*]. If a child or a man from the common people, or a member of certain races, narrates or describes something, it is easy to see that he is not content to make his idea plain to the hearer by the choice of clear words, but that he also represents its subject matter in his expressive movements: he combines the mimetic and the verbal forms of representation. And he especially demonstrates quantities and [193]
intensities: 'a high mountain' – and he raises his hand over his head, 'a little dwarf' – and he holds it near the ground. He may have broken himself of the habit of painting with his hands, yet for that reason he will do it with his voice; and if he exercises self-control in this too, it may be wagered that he will open his eyes wide when he describes something large and squeeze them shut when he comes to something small. What he is thus expressing is not his affects but actually the content of what he is having an idea of.

Are we to suppose, then, that this need for mimetics is only aroused by the requirements of communicating something, in spite of the fact that a good part of this method of representation altogether escapes the hearer's attention? On the contrary, I believe that these mimetics exist, even if with less liveliness, quite apart from any communication, that they occur as well when the subject is forming an idea of something for his own private benefit and is thinking of something pictorially, and that he then expresses 'large' and 'small' in his own body just as he does in speech, at all events by a change in the innervation of his features and sense organs. I can even believe that the somatic innervation which is commensurate with the content of what he is having an idea of may have been the beginning and origin of mimetics for purposes of communication; it only needed to be intensified and made noticeable to other people in order to be able to serve that end. If I support the view that to the 'expression of the emotions', which is well known as the

1 [Some approach to the ideas contained in this passage may perhaps be traced in Sections 17 and 18 of Part I of Freud's 'Project'. (See footnote 2, p. 166 above.)]

physical concomitant of mental processes, there should be added the 'expression of the ideational content', I can see quite clearly that my remarks relating to the category of large and small do not exhaust the subject. I might myself add a variety of points even before arriving at the phenomena of tension by which a person indicates somatically the concentration of his attention and the level of abstraction at which his thinking is at the moment proceeding. I regard the matter as a really important one, and I believe that if ideational mimetics are followed up, they may be as useful in other branches of aesthetics as they are here for an understanding of the comic.

To return now to the comic of movement. When, I repeat, a particular
[194] movement is perceived, the impulsion is given to forming an idea of it by means of a certain expenditure of energy. In 'trying to understand', therefore, in apperceiving this movement, I make a certain expenditure, and in this portion of the mental process I behave exactly as though I were putting myself in the place of the person I am observing. But at the same moment, probably, I have in sight the aim of this movement, and my earlier experience enables me to estimate the scale of expenditure required for reaching that aim. In doing so I disregard the person whom I am observing and behave as though I myself wanted to reach the aim of the movement. These two possibilities in my imagination amount to a comparison between the observed movement and my own. If the other person's movement is exaggerated and inexpedient, my increased expenditure in order to understand it is inhibited *in statu nascendi*, as it were in the act of being mobilized [p. 131 above]; it is declared superfluous and is free for use elsewhere or perhaps for discharge by laughter. This would be the way in which, other circumstances being favourable, pleasure in a comic movement is generated – an innervatory expenditure which has become an unusable surplus when a comparison is made with a movement of one's own.

It will be seen that our discussions must proceed in two different directions: first, to establish the conditions governing the discharge of the surplus, and second, to examine whether the other cases of the comic can be looked at in the same way as the comic of movement.

We will take the second question first and will turn from the comic of movement and action to the comic which is found in the intellectual functions and the character traits of other people.

As a sample of this class we may choose comic nonsense, as it is produced by ignorant candidates in an examination; it is no doubt more difficult to give a simple example of character traits. We should not be

confused if we find that nonsense and stupidity, which so often produce a comic effect, are nevertheless not felt as comic in every case, just as the same characters which on one occasion can be laughed at as comic may on another occasion strike one as contemptible or hateful. This fact, of which we must not lose sight, merely points out that other factors are concerned in producing the comic effect besides the comparison we know about – factors which we may be able to trace out in another connection. [See p. 188 ff. below.] [195]

The comic that is found in someone else's intellectual and mental characteristics is evidently once again the outcome of a comparison between him and my own self, though, curiously enough, a comparison which has as a rule produced the opposite result to that in the case of a comic movement or action. In this latter case it was comic if the other person had made a greater expenditure than I thought I should need. In the case of a mental function, on the contrary, it becomes comic if the other person has spared himself expenditure which I regard as indispensable (for nonsense and stupidity are inefficiencies of function). In the former case I laugh because he has taken too much trouble, in the latter because he has taken too little. The comic effect apparently depends, therefore, on the *difference*[I] between the two cathectic expenditures – one's own and the other person's as estimated by 'empathy'[t] ['*Einfühlung*'][T] – and not on which of the two the difference favours. But this peculiarity, which at first sight confuses our judgement, vanishes when we bear in mind that a restriction of our muscular work and an increase of our intellectual work fit in with the course of our personal development towards a higher level of civilization [*Kulturstufe*]. By raising our intellectual expenditure we can achieve the same result with a diminished expenditure on our movements. Evidence of this cultural success [*Kulturerfolg*] is provided by our machines.[2]

Thus a uniform explanation is provided of the fact that a person appears comic to us if, in comparison with ourselves, he makes too great an expenditure on his bodily functions and too little on his mental ones; and it cannot be denied that in both these cases our laughter expresses a pleasurable sense of the superiority which we feel in relation to him. If the relation in the two cases is reversed – if the other person's physical expenditure is found to be less than ours or his mental expenditure

1 [See footnote 1, p. 163 above.]

2 As the proverb says: 'Was man nicht im Kopfe hat, muss man in den Beinen haben.' [Literally 'What one hasn't in one's head one must have in one's legs.']

[196] greater – then we no longer laugh, we are filled with astonishment and admiration.[1]

The origin of comic pleasure which has been discussed here – its derivation from a comparison of another person with ourselves, from the difference between our own psychical expenditure and the other person's as estimated by empathy – is probably the most important genetically [*genetisch*][T]. It is certain, however, that it has not remained the only one. We have learnt at one time or other to disregard this comparison between the other person and ourselves and to derive the pleasurable difference from the one side only, whether from the empathy or from the processes in ourselves – which proves that the feeling of superiority bears no essential relation to comic pleasure. A comparison is [nevertheless] indispensable for the generation of this pleasure. We find that it is made between two cathectic expenditures that occur in rapid succession and are concerned with the same function, and these expenditures are either brought about in us through empathy into someone else or, without any such relation, are discovered in our own mental processes.

The first of these cases – in which, therefore, the other person still plays a part, though no longer in comparison with our own self – arises when the pleasurable difference in cathectic expenditures is brought about by external influences, which we may sum up as a 'situation'. For that reason, this species of the comic is also known as 'the comic of situation'. The characteristics of the person who provides the comic effect do not in this case play an essential part: we laugh even if we have to confess that *we* should have had to do the same in that situation. We are here extracting the comic from the relation of human beings to the often over-powerful external world; and so far as the mental processes of a human being are concerned, this external world also comprises social conventions and necessities and even his own bodily needs. A typical instance of the latter kind is provided if, in the middle of an activity which makes demands on a person's mental powers, he is suddenly interrupted by a pain or an excretory need. The contrast which, through [197] empathy, offers us the comic difference is that between the high degree of interest taken by him *before* the interruption and the minimal one that he has left over for his mental activity when the interruption has occurred. The person who offers us this difference becomes comic to us

1 The contradictoriness with which the determining conditions of the comic are pervaded – the fact that sometimes an excess and sometimes an insufficiency seems to be the source of comic pleasure – has contributed no little to the confusion of the problem. Cf. Lipps (1898, 47).

once again for his inferiority; but he is inferior only in comparison with his earlier self and not in comparison with *us*, for we know that in the same circumstances we could not have behaved otherwise. But it is noteworthy that we only find someone's being put in a position of inferiority comic where there is empathy – that is, where someone else is concerned: if we ourselves were in similar straits we should be conscious only of distressing feelings. It is probably only by keeping such feelings away from ourselves that we are able to enjoy pleasure from the difference arising out of a comparison between these changing cathexes.

The other source of the comic, which we find in the transformations of *our own* cathexes, lies in our relations with the future, which we are accustomed to anticipate with our expectant ideas [*Erwartungsvorstellungen*]. I assume that a quantitatively definite expenditure underlies each of our ideas – an expenditure which, in the event of a disappointment, is therefore diminished by a definite difference. Here I may once again recall the remarks I made earlier [p. 167 f. above] on 'ideational mimetics'. But it seems to me to be easier to prove a real mobilization of cathectic energy in the case of expectation. It is quite obviously true of a number of cases that motor preparations are what form the expression of expectation – above all in all cases in which the expected event makes demands on my motility – and that these preparations can be at once determined quantitatively. If I am expecting to catch a ball which is being thrown to me, I put my body into tensions which will enable it to meet the impact of the ball; and, should the ball when it is caught turn out to be too light, my superfluous movements make me comic to the spectators. I have let myself be enticed by my expectation into an exaggerated expenditure of movement. The same is true if, for instance, I lift a fruit which I have judged to be heavy out of a basket, but which, to my disappointment, turns out to be a sham one, hollow and made of wax. My hand, by jumping up, betrays the fact that I had prepared an innervation too large for the purpose – and I am laughed at for it. There is at least one [198]
case in which the expenditure on expectation can be directly demonstrated measurably by physiological experiments on animals. In Pavlov's experiments on salivary secretions, various kinds of food are set before dogs in whom a salivary fistula has been opened; the amounts of saliva secreted then vary according to whether the experimental conditions confirm or disappoint the dogs' expectations of being fed with the food set before them.

Even when what is expected makes demands on my sense organs and not on my motility, I may assume that the expectation is expressed in a

certain motor expenditure towards making the senses tense and towards holding back other impressions that are not expected; and, in general, I may regard an attitude of attention as being a motor function equivalent to a certain expenditure. I may further take it as a premise that the preparatory activity of expectation will not be independent of the magnitude of the impression that is expected, but that I shall represent its largeness or smallness mimetically by a larger or smaller preparatory expenditure, as in the case of making a communication and in the case of thinking unaccompanied by expectation. The expenditure on expectation is, however, put together from several components, and in the case of my disappointment, too, various points will be involved – not only whether what happens is perceptually greater or smaller than what is expected, but also whether it is worthy of the great interest which I had expended on the expectation. In this way I shall perhaps be led to take into account, besides the expenditure on the representation of large and small (the ideational mimetics), the expenditure on tightening the attention (the expenditure on expectation), and beyond this in other cases the expenditure on abstraction. But these other kinds of expenditure can easily be traced back to that on large and small, since what is more interesting, more sublime and even more abstract are only special cases, with particular qualities, of what is larger. If we consider in addition that, according to Lipps and other writers, *quantitative* (and not qualitative) contrast is to be regarded primarily as the source of comic pleasure, we shall on the whole feel glad that we chose the comic of movement as the starting point of our enquiry.

[199] Lipps, in the volume which has been so often quoted in these pages, has attempted, as an amplification of Kant's statement[1] that the comic is 'an expectation that has turned to nothing', to derive comic pleasure quite generally from expectation. [Lipps, 1898, 50 ff.] In spite, however, of the many instructive and valuable findings which this attempt has brought to light, I should like to support the criticism made by other authorities that Lipps has taken the field of origin of the comic far too narrowly and has been obliged to use great violence [*Zwang*] in order to bring its phenomena within the scope of his formula.

[2]

Mankind have not been content to enjoy the comic where they have come upon it in their experience; they have also sought to bring it about

1 [Cf. footnote, p. 12 above.]

intentionally, and we can learn more about the nature of the comic if we study the means which serve to *make* things comic. First and foremost, it is possible to produce the comic in relation to oneself in order to amuse other people – for instance, by making oneself out clumsy or stupid. In that way one produces a comic effect exactly as though one really were these things, by fulfilling the condition of the comparison which leads to the difference in expenditure. But one does not in this way make oneself ridiculous or contemptible, but may in some circumstances even achieve admiration. The feeling of superiority does not arise in the other person if he knows that one has only been pretending; and this affords fresh evidence of the fundamental independence of the comic from the feeling of superiority [p. 170 above].

As regards making *other people* comic, the principal means is to put them in situations in which a person becomes comic as a result of human dependence on external events, particularly on social factors, without regard to the personal characteristics of the individual concerned – that is to say, by employing the comic of situation. This putting of someone in a comic situation may be a *real* one (a practical joke[1]) – by sticking out a leg so that someone trips over it as though he were clumsy, by making him seem stupid by exploiting his credulity, or trying to convince him of something nonsensical, and so on – or it may be simulated by speech or [200] play. The aggressiveness, to which making a person comic usually ministers, is much assisted by the fact that the comic pleasure is independent of the reality of the comic situation, so that everyone is in fact exposed, without any defence, to being made comic.

But there are yet other means of making things comic which deserve special consideration and also indicate in part fresh sources of comic pleasure. Among these, for instance, is *mimicry*, which gives quite extraordinary pleasure to the hearer and makes its object comic even if it is still far from the exaggeration of a caricature. It is much easier to find a reason for the comic effect of *caricature* than for that of mere mimicry. Caricature, parody and travesty (as well as their practical counterpart, unmasking) are directed against people and objects which lay claim to authority and respect, which are in some sense '*sublime*'.[2] They are procedures for *Herabsetzung*, as the apt German expression has it.[3] What is

1 [In English in the original.]

2 [The German word here is '*erhaben*', for which the accepted English translation in aesthetics is 'sublime'. As, however, it is difficult to apply this rendering in the case of people, we have, where necessary, used the word 'exalted' instead.]

3 'Degradation' [in English in the original]. Bain (1865, 248) writes: 'The occasion of the Ludicrous is the Degradation of some person or interest, possessing dignity, in circumstances that excite no other strong emotion.' [The English word 'degradation' has accordingly been used in all that follows as a translation of '*Herabsetzung*'.]

sublime is something large in the figurative, psychical sense; and I should like to suggest, or rather to repeat my suggestion [cf. p. 171 f. above], that, like what is somatically large, it is represented by an increased expenditure. It requires little observation to establish that when I speak of something sublime I innervate my speech in a different way, I make different facial expressions, and I try to bring the whole way in which I hold myself into harmony with the dignity of what I am having an idea of. I impose a solemn restraint upon myself – not very different from what I should adopt if I were to enter the presence of an exalted personality, a monarch or a prince of science. I shall hardly be wrong in assuming that this different innervation in my ideational mimetics corresponds to an
[201] increased expenditure. The third instance[1] of an increased expenditure of this kind is no doubt to be found when I proceed in abstract trains of thought instead of in the habitual concrete and plastic ones. When, therefore, the procedures that I have discussed for the degradation of the sublime allow me to have an idea of it as though it were something commonplace, in whose presence I need not pull myself together but may, to use the military formula, 'stand easy', I am being spared the increased expenditure of the solemn restraint; and the comparison between this new ideational method (instigated by empathy) and the previously habitual one, which is simultaneously trying to establish itself – this comparison once again creates the difference in expenditure which can be discharged by laughter.

Caricature, as is well known, brings about degradation by emphasizing in the general impression given by the exalted object a single trait which is comic in itself but was bound to be overlooked so long as it was only perceivable in the general picture. By isolating this, a comic effect can be attained which extends in our memory over the whole object. This is subject to the condition that the actual presence of the exalted object himself does not keep us in a reverential attitude. If a comic trait of this kind that has been overlooked is lacking in reality, a caricature will unhesitatingly create it by exaggerating one that is not comic in itself; and the fact that the effect of the caricature is not essentially diminished by this falsification of reality is once again an indication of the origin of comic pleasure [p. 173].

Parody and *travesty* achieve the degradation of something exalted in another way: by destroying the unity that exists between people's characters as we know them and their speeches and actions, by replacing either the exalted figures or their utterances with inferior ones. They are

1 [The other two being presumably the somatically large and the sublime.]

distinguished from caricature in this, but not in the mechanism of their production of comic pleasure. The same mechanism is also used for *unmasking*, which applies only where someone has seized dignity and authority by a deception and these have to be taken from him in reality. We have already met with a few examples of the comic effect of unmasking in jokes – for instance, in the story of the aristocratic lady who, at the first onset of her labour pains, exclaimed 'Ah! mon Dieu!' but whom the doctor would not assist till she cried out 'Aa-ee, aa-ee!' [p. 71 above]. Having come to know the characteristics of the comic, we can no longer [202]
dispute that this anecdote is in fact an example of comic unmasking and has no justifiable claim to be called a joke. It only recalls jokes by its setting and by the technical method of 'representation by something very small' [loc. cit.] – in this case the patient's cry, which is found sufficient to establish the indication for treatment. It nevertheless remains true that our linguistic sense, if we call on it for a decision, raises no objection to our calling a story like this a joke. We may explain this by reflecting that linguistic usage is not based on the scientific insight into the nature of jokes that we have arrived at in this laborious investigation. Since one of the functions of jokes is to make hidden sources of comic pleasure accessible once more (p. 90 f.), any device that brings to light something that is not manifestly comic may, by a loose analogy, be termed a joke. This applies preferably, however, to unmasking as well as to other methods of making people comic.[1]

Under the heading of 'unmasking' we may also include a procedure for making things comic with which we are already acquainted [p. 170 f.] – the method of degrading the dignity of individuals by directing attention to the frailties which they share with all humanity, but in particular the dependence of their mental functions on bodily needs. The unmasking is equivalent here to an admonition: such and such a person, who is admired as a demigod, is after all only human like you and me. Here, too, are to be placed the efforts at laying bare the monotonous psychical automatism that lies behind the wealth and apparent freedom of psychical functions. We came across examples of 'unmasking' of this kind in the marriage-broker jokes, and felt a doubt at the time whether these anecdotes have a right to be counted as jokes [p. 57]. We are now able to decide with greater certainty that the anecdote of the echo [p. 56] who reinforced all the assertions of

1 'Thus every conscious and ingenious evocation of the comic (whether the comic of contemplation or of situation) is in general described as a joke. We, of course, cannot here make use of this concept of the joke either.' (Lipps, 1898, 78.)

the marriage broker and finally confirmed his admission that the bride had a hump with the exclamation 'And *what* a hump!' – that this anecdote is essentially a *comic* story, an example of the unmasking of a
[203] psychical automatism. Here, however, the comic story is only serving as a façade. For anyone who will attend to the hidden meaning of the marriage-broker anecdotes, the whole thing remains an admirably staged joke [p. 92 ff. above]; anyone who does not penetrate so far is left with a comic story. The same thing applies to the other joke, about the marriage broker who, in order to answer an objection, ended by confessing the truth with a cry of 'But I ask you, who would lend such people anything?' [p. 57.] Here again we have a comic unmasking as the façade for a joke, though in this instance the characteristic of a joke is much more unmistakable, since the marriage broker's remark is at the same time a representation by the opposite. In trying to prove that the people are rich he at the same time proves that they are *not* rich, but very poor. Here a joke and the comic are combined, and teach us that the same remark can be both things at once.

We are glad to seize the opportunity of returning to jokes from the comic of unmasking, since our true problem is not to determine the nature of the comic but to throw light on the relation between jokes and the comic. We have discussed the uncovering of psychical automatism, in a case in which our feeling as to whether something is comic or a joke left us in the lurch. And we will now add another case in which there is a similar confusion between jokes and the comic – the case of nonsensical jokes. But our investigation will show us in the end that as regards this second case the convergence between jokes and the comic can be theoretically accounted for. [Cf. p. 179.]

In discussing the techniques of jokes we found that giving free play to modes of thought which are usual in the unconscious but which can only be judged as examples of 'faulty reasoning' in the conscious is the technical method adopted in many jokes; and about these, once again, we felt doubts whether they possessed the true character of jokes, so that we were inclined to classify them simply as comic stories [p. 53 f.]. We were unable to reach a decision about our doubts because at the time we were ignorant of the essential characteristic of jokes. Subsequently, led by an analogy with the dream-work, we discovered that it lay in the compromise effected by the joke-work between the demands of
[204] reasonable criticism and the urge not to renounce the ancient pleasure in words and nonsense [p. 120 f.]. What came about in this way as a compromise, when the preconscious start of the thought was left for a

moment to unconscious revision, satisfied both claims in every instance, but presented itself to criticism in various forms and had to put up with various judgements at its hands. Sometimes a joke would succeed in slipping on the appearance of an insignificant but nevertheless permissible assertion, another time it would smuggle itself in as the expression of a valuable thought. But, in the marginal case of effecting a compromise, it would give up attempting to satisfy criticism. Boasting of the sources of pleasure at its command, it would appear before criticism as sheer nonsense and not be afraid to provoke contradiction from it; for the joke could reckon on the hearer straightening out the disfigurement in the form of its expression by unconscious revision and so giving it back its meaning.

In what instances, then, will a joke appear before criticism as nonsense? Particularly when it makes use of the modes of thought which are usual in the unconscious but are proscribed in conscious thought – faulty reasoning, in fact. For certain modes of thought proper to the unconscious have also been retained by the conscious – for instance, some kinds of indirect representation, allusion, and so on – even though their conscious employment is subject to considerable restrictions. When a joke makes use of these techniques it will raise little or no objection on the part of criticism; objections will appear only if it also makes use for its technique of the methods with which conscious thought will have nothing more to do. A joke can still avoid objection, if it conceals the faulty reasoning it has used and disguises it under a show of logic, as happened in the anecdotes of the cake and the liqueur [p. 53 above], of the salmon mayonnaise [p. 44], and similar ones. But if it produces the faulty reasoning undisguised, then the objections of criticism will follow with certainty.

In such cases the joke has another resource. The faulty reasoning, which it uses for its technique as one of the modes of thought of the unconscious, strikes criticism – even though not invariably so – as being *comic*. Consciously giving free play to unconscious modes of thought (which have been rejected as faulty) is a means of producing comic pleasure; and it is easy to understand this, since it certainly requires a [205]
greater expenditure of energy to establish a preconscious cathexis than to give free play to an unconscious one. When, on hearing a thought which has, as it were, been formed in the unconscious, we compare it with its correction, a difference in expenditure emerges for us from which comic pleasure arises. A joke which makes use of faulty reasoning like this for its technique, and therefore appears nonsensical, can thus

produce a comic effect at the same time. If we fail to detect the joke, we are once again left with only the comic or funny story.

The story of the borrowed kettle which had a hole in it when it was given back (p. 55) is an excellent example of the purely comic effect of giving free play to the unconscious mode of thought. It will be recalled that the borrower, when he was questioned, replied firstly that he had not borrowed a kettle at all, secondly that it had had a hole in it already when he borrowed it, and thirdly that he had given it back undamaged and without a hole. This mutual cancelling out by several thoughts, each of which is in itself valid, is precisely what does not occur in the unconscious. In dreams, in which the modes of thought of the unconscious are actually manifest, there is accordingly no such thing as an 'either–or',[1] only a simultaneous juxtaposition. In the example of a dream, which, in spite of its compilation, I chose in my *Interpretation of Dreams* as a specimen of the work of interpretation, I tried to rid myself of the reproach of having failed to relieve a patient of her pains by psychical treatment. My reasons were: (1) that she herself was responsible for her illness because she would not accept my solution, (2) that her pains were of organic origin and were therefore no concern of mine, (3) that her pains were connected with her widowhood, for which I was evidently not responsible, and (4) that her pains were due to an injection from a contaminated syringe, which had been given her by someone else. All these reasons stood side by side, as though they were not mutually exclusive. I was obliged to replace the 'and' of the dream by an 'either–or' in order to escape a charge of nonsense.[2]

[206] There is a similar comic story of a Hungarian village in which the blacksmith had been guilty of a capital offence. The burgomaster, however, decided that as a penalty a *tailor* should be hanged and not the blacksmith, because there were two tailors in the village but no second blacksmith, and the crime must be expiated.[3] A displacement of this kind from the figure of the guilty person to another naturally contradicts every law of conscious logic but by no means the mode of thought of the unconscious. I do not hesitate to call this story comic, and yet I have included the one about the kettle among the jokes. I will now admit that this latter story too is far more correctly described as 'comic'

1 At the most, it is introduced by the narrator by way of interpretation. [See *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 282–3.]

2 [See *The Interpretation of Dreams*, ibid., **4**, 107, where the story of the borrowed kettle also appears again.]

3 [This story is repeated in the *Introductory Lectures* (1916–17*a*), ibid., **15**, 152, and in Chapter IV of *The Ego and the Id* (1923*b*), ibid., **19**, 40.]

rather than as a joke. But I now understand how it is that my feeling, which is as a rule so sure, can leave me in doubt as to whether this story is comic or a joke. This is a case in which I cannot come to a decision on the basis of my feeling – when, that is, the comic arises from the uncovering of a mode of thought that is exclusively proper to the unconscious. A story like this may be comic and a joke at the same time; but it will give me the impression of being a joke, even if it is merely comic, because the use of the faulty reasoning of the unconscious reminds me of jokes, just as did the manoeuvres for uncovering what is not manifestly comic (p. 175).

I set great store by clarifying this most delicate point in my arguments – the relation of jokes to the comic; and I will therefore supplement what I have said with a few negative statements. I may first draw attention to the fact that the instance of the convergence of jokes and the comic which I am dealing with here is not identical to the former one (p. 175). It is true that the distinction is a rather narrow one, but it can be made with certainty. In the earlier case the comic arose from the uncovering of psychical automatism. This, however, is by no means peculiar to the unconscious alone, nor does it play any striking part in the technique of jokes. Unmasking only comes into relation with jokes accidentally, when it serves some other joke technique, such as representation by the opposite. But in the case of giving free play to unconscious modes of thought the convergence of jokes and the comic is a *necessary* one, since the same method which is used here by the first person of the joke as a technique for releasing pleasure must from its very nature produce comic pleasure in the third person. [207]

One might be tempted to generalize from this last case and look for the relation of jokes to the comic in the notion that the effect of jokes on the third person takes place according to the mechanism of comic pleasure. But there is no question of this being so. Contact with the comic is by no means to be found in all jokes or even in the majority of them; in most cases, on the contrary, a clear distinction is to be made between jokes and the comic. Whenever a joke succeeds in escaping the appearance of nonsense – that is, in most jokes accompanied by double meaning and allusion – there is no trace to be found in the hearer of any effect resembling the comic. This may be tested on the examples I have given earlier, or on a few new ones that I can bring up:

Telegram of congratulations to a gambler on his seventieth birthday: '*Trente et quarante*.' (Dividing up [pp. 28 and 37 above] with allusion.)

Hevesi somewhere describes the process of tobacco manufacture: 'The bright yellow leaves . . . were dipped in a sauce and were sauced in this dip.'[1] (Multiple use of the same material).

Madame de Maintenon was known as 'Madame de *Maintenant*'. (Modification of a name.)

Professor Kästner [cf. p. 114 above] said to a prince who stood in front of a telescope during a demonstration: 'Your Highness, I know quite well that you are "*durchläuchtig* (illustrious)",[2] but you are not "*durchsichtig* (transparent)".'

Count Andrássy was known as 'Minister of the Fine Exterior'.[3]

It might further be thought that at any rate all jokes with a façade of nonsense will seem comic and must produce a comic effect. But I must recall that jokes of this kind very often affect the hearer in another way and provoke bewilderment and a tendency to repudiation (see p. 121 *n.*).
[208] Thus it evidently depends on whether the nonsense of a joke appears as comic or as sheer ordinary nonsense – and we have not yet investigated what determines this. We therefore stick to our conclusion that jokes are from their nature to be distinguished from the comic and only converge with it, on the one hand, in certain special cases and, on the other hand, in their aim of obtaining pleasure from intellectual sources.

During these enquiries into the relations between jokes and the comic the distinction has become plain to us which we must emphasize as the most important and which points at the same time to a main psychological characteristic of the comic. We found ourselves obliged to locate the pleasure in jokes in the unconscious; no reason is to be found for making the same localization in the case of the comic. On the contrary, all the analyses we have hitherto made have pointed to the source of comic pleasure being a comparison between two expenditures both of which must be ascribed to the preconscious. Jokes and the comic are distinguished first and foremost in their psychical localization; *the joke, it may be said, is the contribution made to the comic from the realm of the unconscious*.[4]

1 ['Saucing' (German '*tunken*') used to be part of the technical process for preparing tobacco.]

2 [An adjective derived from '*Durchlaucht*', a title applied to some high nobility and minor royalty: 'Serene Highness'.]

3 [Count Gyula Andrássy (1823–90) was for many years the Austro-Hungarian Minister for Foreign Affairs (for 'the Exterior'). He was something of a dandy.]

4 [The italics date only from the second edition (1912).]

[3]

There is no need to apologize for this digression, since the relation of jokes to the comic was the reason for our being forced into an investigation of the comic. But it is certainly time we returned to our previous topic – the discussion of the methods which serve for making things comic. We considered caricature and unmasking first, because we can derive some indications from these two for the analysis of the comic of *mimicry*. As a rule, no doubt, mimicry is permeated with caricature – the exaggeration of traits that are not otherwise striking [p. 174 above] – and it also involves the characteristic of degradation. But this does not seem to exhaust its nature. It cannot be disputed that it is in itself an extraordinarily fertile source of comic pleasure, for we laugh particularly at the *faithfulness* of a piece of mimicry. It is not easy to give a satisfactory explanation of this unless one is prepared to adopt the view held by Bergson (1900), which approximates the comic of mimicry to the comic due to the discovery of psychical automatism. Bergson's opinion [209] is that everything in a living person that makes one think of an inanimate mechanism has a comic effect. His formula for this runs '*mècanisation de la vie*'. He explains the comic of mimicry by starting out from a problem raised by Pascal in his *Pensées* of why it is that one laughs when one compares two similar faces neither of which has a comic effect by itself. 'What is living should never, according to our expectation, be repeated exactly the same. When we find such a repetition we always suspect some mechanism lying behind the living thing.' [Bergson, 1900, 35.] When one sees two faces that resemble each other closely, one thinks of two impressions from the same mould or of some similar mechanical procedure. In short, the cause of laughter in such cases would be the divergence of the living from the inanimate, or, as we might say, the degradation of the living to the inanimate (ibid., 35). If, moreover, we were to accept these plausible suggestions of Bergson's, we should not find it difficult to include his view under our own formula. Experience has taught us that every living thing is different from every other and calls for a kind of expenditure by our understanding; and we find ourselves disappointed if, as a result of complete conformity or deceptive mimicry, we need make no fresh expenditure. But we are disappointed in the sense of a relief, and the expenditure on expectation which has become superfluous is discharged by laughter. The same formula would also cover all the cases which Bergson considers of comic rigidity ('*raideur*'), of professional customs, fixed ideas, and turns of speech

repeated on every possible occasion. All these cases would go back to a comparison between the expenditure on expectation and the expenditure actually required for an understanding of something that has remained the same; and the larger amount needed for expectation would be based on observation of the multiplicity and plasticity of living things. In the case of mimicry, accordingly, the source of the comic pleasure would be not the comic of situation but of expectation [p. 171 above].

Since we derive comic pleasure in general from a comparison, it is incumbent on us to examine the comic of comparison itself; and this, indeed, serves as a method of making things comic. Our interest in this question will be increased when we recall that in the case of analogies, [210] too, we often found that our 'feeling' left us in the lurch as to whether something was to be called a joke or merely comic (p. 71 f.).

The subject would, it must be admitted, deserve more careful treatment than our interests can devote to it. The main attribute that we enquire after in an analogy is whether it is apt – that is, whether it draws attention to a conformity which is really present in two different objects. The original pleasure in rediscovering the same thing (Groos, 1899, 153 [and above, p. 106 f.]) is not the only motive that favours the use of analogies; there is the further fact that analogies are capable of a use which brings with it a relief of intellectual work – if, that is to say, one follows the usual practice of comparing what is less known with what is better known or the abstract with the concrete, and by the comparison elucidates what is more unfamiliar or more difficult. Every such comparison, especially of something abstract with something concrete, involves a certain degradation and a certain economy in expenditure on abstraction (in the sense of ideational mimetics) [p. 172], but this is of course not sufficient to allow the characteristic of the comic to come clearly into prominence. It does not emerge suddenly but gradually from the pleasure of the relief brought about by the comparison. There are plenty of cases which merely fringe on the comic and in which doubt might be felt whether they show the characteristic of the comic. The comparison becomes undoubtedly comic if there is a rise in the level of difference between the expenditure on abstraction in the two things that are being compared, if something serious and unfamiliar, especially if it is of an intellectual or moral nature, is brought into comparison with something commonplace and inferior. The previous pleasure of the relief and the contribution from the determinants of ideational mimetics may perhaps explain the gradual transition, conditioned by quantitative factors, from general pleasure to comic pleasure during the comparison. I shall no

doubt avoid misunderstandings if I stress the fact that I do not trace the comic pleasure in analogies to the contrast between the two things compared but to the difference between the two expenditures on abstraction. When an unfamiliar thing that is hard to take in, a thing that is abstract and in fact sublime in an intellectual sense, is alleged to tally with something familiar and inferior, in imagining which there is a complete absence of any expenditure on abstraction, then that abstract thing is [211]
itself unmasked as something equally inferior. The comic of comparison is thus reduced to a case of degradation.

A comparison can, however, as we have already seen, be in the nature of a joke, without a trace of comic admixture – precisely, that is, when it avoids degradation. Thus the comparison of truth with a torch that cannot be carried through a crowd without singeing someone's beard [p. 72 above] is purely in the nature of a joke, because it takes a watered-down turn of speech ('the torch of truth') at its full value, and it is not comic, because a torch as an object, though it is a concrete thing, is not without a certain distinction. But a comparison can just as easily be a joke and comic as well, and can be each independently of the other, since a comparison can be of help to certain techniques of jokes, such as unification or allusion. In this way Nestroy's comparison of memory to a 'warehouse' (p. 75) is at once comic and a joke – the former because of the extraordinary degradation which the psychological concept has to put up with in being compared to a 'warehouse', and the latter because the person making use of the comparison is a clerk, who thus establishes in the comparison a quite unexpected unification between psychology and his profession. Heine's phrase 'till at last . . . every button bursts on my breeches of patience' [p. 74] seems at first sight to be no more than a remarkable example of a comically degrading comparison; but on further consideration we must also allow it the characteristics of a joke, since the comparison, as a means of allusion, impinges on the region of the obscene and so succeeds in liberating pleasure in the obscene. The same material, by what is admittedly not an entirely chance coincidence, provides us with a yield of pleasure which is simultaneously comic and of the character of a joke. If the conditions of the one favour the generation of the other, their union has a confusing effect on the 'feeling' which is supposed to tell us whether we are being offered a joke or something comic, and a decision can be arrived at only by an attentive investigation that has been freed from any predisposition to a particular kind of pleasure.

However attractive it may be to follow up these more intimate determinants of the yield of comic pleasure, the author must bear in

[212] mind that neither his education nor his daily occupation justifies his extending his enquiries far beyond the sphere of jokes; and he must confess that the topic of comic comparisons makes him particularly aware of his inability.

We therefore readily recall that many authorities do not recognize the sharp conceptual and material distinction between jokes and the comic to which we have found ourselves led, and that they regard jokes as simply 'the comic of speech' or 'of words'. In order to test this view we will choose one example each of something intentionally and of something involuntarily comic in words to compare with jokes. We have remarked earlier that we believe ourselves very well able to distinguish a comic remark from a joke:

> 'With a fork and much to-do
> His mother dragged him from the stew' [p. 61 above]

is merely comic; Heine's remark about the four castes among the inhabitants of Göttingen – 'professors, students, philistines and donkeys' [p. 60 f.] – is *par excellence* a joke.

For something intentionally comic I will take as a model Stettenheim's 'Wippchen'.[1] People speak of Stettenheim as 'witty' because he possesses to a special degree the gift of evoking the comic. This capacity does, in fact, aptly determine the 'wit' that one 'has' in contrast to the 'joke' that one 'makes'.[2] It cannot be disputed that the letters of Wippchen, the correspondent from Bernau, are also 'witty' insofar as they are abundantly sprinkled with jokes of every kind, among them some that are genuinely successful (e.g. of a display by savages: 'in ceremonial undress'). But what gives these productions their peculiar character is not these separate jokes but the almost too abundant comic of speech which flows through them. 'Wippchen' was no doubt originally intended as a satirical figure, a modification of Gustav Freytag's 'Schmock',[3] one of those uneducated people who misuse and trade away the nation's store of culture; but the author's enjoyment of the comic effects achieved in his [213] picture of this character has evidently pushed the satirical purpose little by little into the background. Wippchen's productions are for the most part 'comic nonsense'. The author has made use of the pleasurable mood brought about by the piling up of these successes to introduce

1 [Julius Stettenheim (1831–1916), Berlin journalist.]

2 [The same German word '*Witz*' is used here for both 'wit' and 'joke'. Cf. p. 122 above.]

3 [Gustav Freytag (1816–95), novelist and dramatist. 'Schmock' was an unscrupulous journalist in his comedy *Die Journalisten*.]

(justifiably, it must be said), alongside perfectly permissible material, all kinds of insipidities which could not be tolerated on their own account. Wippchen's nonsense produces a specific effect on account of a peculiar technique. If one looks more closely at these 'jokes' one is specially struck by a few kinds which give the whole production its stamp. Wippchen makes use predominantly of combinations (amalgamations), modifications of familiar turns of speech and quotations and replacements of a few commonplace elements in them by more pretentious and weighty forms of expression. This incidentally is coming near to the techniques of jokes.

Here, for instance, are some amalgamations (taken from the preface and the first pages of the whole series):

'Turkey has money *wie Heu am Meere*' [like hay by the sea]. This is made up of the two expressions: 'Money *wie Heu*' [like hay] and 'Money *wie Sand am Meere*' [like sand by the sea].[1]

Or, 'I am no more than a column stripped of its leaves,[2] which bears witness to its vanished glory' – condensed from 'a tree stripped of its leaves' and 'a column which . . . etc.'

Or, 'Where is the thread of Ariadne which will lead me from the Scylla of this Augean stable?' to which three Greek legends have each contributed an element.

The modifications and substitutions can be summarized without much difficulty. Their nature can be seen from the following examples, which are characteristic of Wippchen and behind which we invariably have a glimpse of another, more current and usually more commonplace wording, which has been reduced to a cliché:

'*Mir Papier und Tinte höher zu hängen*' [to hang paper and ink higher for me]. We use the phrase '*einem den Brotkorb höher hängen*' [to hang his bread-basket higher for someone – to put someone on short commons] metaphorically for 'to put someone in more difficult circumstances'. So why should not the metaphor be extended to other material? [214]

'Battles in which the Russians sometimes draw the shorter [lot – i.e. come off second best] and sometimes the longer.' Only the first of these expressions ['*den Kürzeren ziehen*', 'draw the shorter'] is in common use; but in view of its derivation there would be no absurdity in bringing the second into use as well.

1 [These are two common expressions in German, equivalent to 'money like dirt' or 'oceans of money'.]

2 ['*Eine entlaubte Säule*' – an echo of '*eine entleibte Seele*', 'a disembodied spirit'.]

'While I was still young, Pegasus stirred within me.' If we put back 'the poet' instead of 'Pegasus' we find an autobiographical cliché well worn by frequent use. It is true that 'Pegasus' is not a suitable substitute for 'the poet', but it has a conceptual relation with it and is a high-sounding word.

'Thus I lived through the thorny shoes of childhood.' A simile instead of a simple statement. '*Die Kinderschuhe austreten*' ['to wear out the shoes of childhood', 'to leave the nursery behind'] is one of the images connected with the concept of childhood.

From the profusion of Wippchen's other productions some can be stressed as pure examples of the comic. For instance, as a comic disappointment: 'For hours the fight fluctuated, until at last it remained undecided.' Or, as a comic unmasking (of ignorance): 'Clio, the Medusa of history.' Or quotations such as: '*Habent sua fata morgana*.'[1] But our interest is more aroused by the amalgamations and modifications, because they repeat familiar joke techniques. We may, for instance, compare with the modifications such jokes as 'he has a great future behind him' [p. 24 above], or '*er hat ein Ideal vor dem Kopf*' [p. 67], or Lichtenberg's modification joke 'new spas cure well' [p. 66], and so on. Are Wippchen's productions which have the same technique now to be called jokes? or how do they differ from these?[2]

It is not difficult to answer. Let us recall that jokes present a double face to their hearer, force him to adopt two different views of them. In a nonsense joke, like the ones last mentioned, the one view, which only
[215] takes the wording into account, regards it as nonsense; the other view, following the hints that are given, passes through the hearer's unconscious and finds an excellent sense in it. In Wippchen's joke-like productions one face of the joke is blank, as though it were rudimentary: a Janus head but with only one face developed on it. If we allow the technique to lure us into the unconscious, we come upon nothing. The amalgamations lead us to no instance in which the two things that are amalgamated really yield a new meaning; if we attempt an analysis, they fall completely apart. The modifications and substitutions lead, as they do in jokes, to a usual and familiar wording; but the modification or substitution itself tells us nothing fresh and as a rule, indeed, nothing possible or serviceable. So that only the one view of these 'jokes' is left

1 ['*Habent sua fata libelli* (books have their destinies)' is a Latin saying attributed to Terence. '*Fata Morgana*' is the Italian name for a particular kind of mirage seen in the Straits of Messina: from Morgan le Fey (fairy), King Arthur's sister.]

2 [Another of Stettenheim's 'jokes' can be found in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 183.]

over – that they are nonsense. We can merely decide whether we choose to call such productions, which have freed themselves from one of the most essential characteristics of jokes, 'bad' jokes or not jokes at all.

Rudimentary jokes of this kind undoubtedly produce a comic effect, which we can account for in more than one way. Either the comic arises from the uncovering of the modes of thought of the unconscious, as in cases we considered earlier [e.g. p. 178 above], or the pleasure comes from the comparison with a complete joke. Nothing prevents our supposing that both these ways of generating comic pleasure converge here. It is not impossible that here the inadequacy of support from a joke is precisely what makes the nonsense into comic nonsense.

For there are other easily intelligible cases in which inadequacy of this kind as compared with what ought to be effected makes the nonsense irresistibly comic. The counterpart of jokes – riddles [p. 59 *n.*] – can perhaps offer us better examples of this than jokes themselves. For instance, here is a 'facetious question' [p. 133 *n.* 1]: 'What is it that hangs on the wall and that one can dry one's hands on?' It would be a stupid riddle if the answer were 'a hand towel'. But that answer is rejected. – 'No, a herring.' – 'But for heaven's sake', comes the infuriated protest, 'a herring doesn't hang on the wall.' – 'You *can* hang it up there.' – 'But who in the world is going to dry his hands on a herring?' – 'Well', is the soothing reply, 'you don't *have* to.' This explanation, given by means of two typical displacements, shows how far this question falls short of a genuine riddle; and on account of its absolute inadequacy it strikes us as [216]
being – instead of simply nonsensically stupid – irresistibly comic. In this way, by failing to comply with essential conditions, jokes, riddles, and other things, which do not produce comic pleasure in themselves, are made into sources of comic pleasure.

There is still less difficulty in understanding the case of the *involuntary* comic of speech, which we can find realized as often as we please in, for instance, the poems of Friederike Kempner (1891):

Against Vivisection
Ein unbekanntes Band der Seelen kettet
Den Menschen an das arme Tier.
Das Tier hat einen Willen – ergo Seele –
Wenn auch 'ne kleinere als wir.[1]

1 [Between mankind and poor dumb beasts there stretches
A chain of souls impossible to see.
Poor dumb beasts have a will – *ergo* a soul too –
E'en though they have a soul smaller than we.]

Or a conversation between a loving married couple:

The Contrast
'Wie glücklich bin ich', ruft sie leise,
'Auch ich', sagt lauter ihr Gemahl,
'Es macht mich deine Art und Weise
Sehr stolz auf meine gute Wahl!'[1]

There is nothing here to make us think of jokes. But there is no doubt that it is the inadequacy of these 'poems' that makes them comic – the quite extraordinary clumsiness of their expression, which is linked with the tritest or most journalistic turns of phrase, the simple-minded limitation of their thought, the absence of any trace of poetic matter or form. In spite of all this, however, it is not obvious why we find Kempner's poems comic. We find many similar products nothing but shockingly bad; they do not make us laugh but annoy us. But it is precisely the greatness of the distance that separates them from what we expect of a poem that imposes the comic view on us; if this difference struck us as smaller
[217] we should be more inclined to criticize than to laugh. Furthermore, the comic effect of Kempner's poems is assured by a subsidiary circumstance – the authoress's unmistakably good intentions and a peculiar sincerity of feeling which disarms our ridicule or our annoyance and which we sense behind her helpless phrases.

Here we are reminded of a problem whose consideration we have postponed. Difference in expenditure is undoubtedly the basic determining condition of comic pleasure; but observation shows that this difference does not invariably give rise to pleasure. What further conditions must be present or what disturbances must be kept back, in order that comic pleasure may actually arise from the difference in expenditure? Before we turn to answering this question, we will conclude this discussion with a clear assertion that the comic of speech does not coincide with jokes, and that jokes must therefore be something other than the comic of speech. [Cf. p. 184 above.]

[4]

Now that we are on the point of approaching an answer to our last question, as to the necessary conditions for the generating of comic pleasure from the difference in expenditure, we may allow ourselves a

1 ['How fortunate am I!' she softly cried.
'I too', declared her husband's louder voice:
'Your many qualities fill me with pride
At having made so excellent a choice.']

relief which cannot fail to give *us* pleasure. An accurate reply to the question would be identical to an exhaustive account of the nature of the comic, for which we can claim neither capacity nor authority. We shall once more be content to throw light on the problem of the comic only so far as it contrasts clearly with the problem of jokes.

Every theory of the comic is objected to by its critics on the score that its definition overlooks what is essential to the comic: 'The comic is based on a contrast between ideas.' 'Yes, insofar as the contrast has a comic and not some other effect.' 'The feeling of the comic arises from the disappointment of an expectation.' 'Yes, unless the disappointment is in fact a distressing one.' No doubt the objections are justified; but we shall be overestimating them if we conclude from them that the essential feature of the comic has hitherto escaped detection. What impairs the universal validity of these definitions are conditions which are indispensable for the generating of comic pleasure; but we do not need to look for the essence of the comic in them. In any case, it will only become easy for [218] us to dismiss the objections and throw light on the contradictions to the definitions of the comic if we suppose that the origin of comic pleasure lies in a comparison of the difference between two expenditures. Comic pleasure and the effect by which it is known – laughter – can only come about if this difference is unutilizable and capable of discharge. We obtain no pleasurable effect but at most a transient sense of pleasure in which the characteristic of being comic does not emerge, if the difference is put to another use as soon as it is recognized. Just as special contrivances have to be adopted in the case of jokes in order to prevent the use elsewhere of the expenditure that is recognized as superfluous [p. 131 ff. above], so, too, comic pleasure can only appear in circumstances that guarantee this same condition. For this reason occasions on which these differences in expenditure occur in our ideational life are uncommonly numerous, but the occasions on which the comic emerges from those differences are relatively quite rare.

Two observations force themselves on anyone who studies even cursorily the conditions for the generation of the comic from difference in expenditure. Firstly, there are cases in which the comic appears habitually and as though by force of necessity, and on the contrary others in which it seems entirely dependent on the circumstances and on the standpoint of the observer. But secondly, unusually large differences very often break through unfavourable conditions, so that the comic feeling emerges in spite of them. In connection with the first of these points it would be possible to set up two classes – the inevitably comic

and the occasionally comic – though one must be prepared from the first to renounce the notion of finding the inevitability of the comic in the first class free from exceptions. It would be tempting to enquire into the determining conditions for the two classes.

The conditions, some of which have been brought together as the 'isolation'[1] of the comic situation, apply essentially to the second class. A closer analysis elicits the following facts:

(*a*) The most favourable condition for the production of comic pleas-
[219] ure is a generally cheerful mood in which one is 'inclined to laugh'. In a toxic mood of cheerfulness almost everything seems comic, probably by comparison with the expenditure in a normal state. Indeed, jokes, the comic and all similar methods of getting pleasure from mental activity are no more than ways of regaining this cheerful mood – this euphoria – from a single point of approach, when it is not present as a general disposition of the psyche.

(*b*) A similarly favourable effect is produced by an *expectation* of the comic, by being attuned to comic pleasure. For this reason, if an intention to make something comic is communicated to one by someone else, differences of such a low degree are sufficient that they would probably be overlooked if they occurred in one's experience unintentionally. Anyone who starts out to read a comic book or goes to the theatre to see a farce owes to this intention his ability to laugh at things which would scarcely have provided him with a case of the comic in his ordinary life. In the last resort it is in the recollection of having laughed and in the expectation of laughing that he laughs when he sees the comic actor come on to the stage, before the latter can have made any attempt at making him laugh. For that reason, too, one admits feeling ashamed afterwards [*nachträglich*] over what one has been able to laugh at at the play.

(*c*) Unfavourable conditions for the comic arise from the kind of mental activity with which a particular person is occupied at the moment. Imaginative or intellectual work that pursues serious aims interferes with the capacity of the cathexes for discharge – cathexes which the work requires for its displacements – so that only unexpectedly large differences in expenditure are able to break through to comic pleasure. What are quite specially unfavourable for the comic are all kinds of intellectual processes which are sufficiently remote from what is perceptual to bring ideational mimetics to a stop. There is no place whatever left for the comic in abstract reflection except when that mode of thought is suddenly interrupted.

1 [Some light is thrown on this by a passage on p. 195 below.]

(*d*) The opportunity for the release of comic pleasure disappears, too, if the attention is focused precisely on the comparison from which the comic may emerge. In such circumstances what would otherwise have the most certain comic effect loses its comic force. A movement or a function cannot be comic for a person whose interest is directed to comparing it with a standard which he has clearly before his mind. Thus the [220]
examiner does not find the nonsense comic which the candidate produces in his ignorance; he is annoyed by it, while the candidate's fellow students, who are far more interested in what luck he will have than in how much he knows, laugh heartily at the same nonsense. A gymnastic or dancing instructor seldom has an eye for the comic in his pupils' movements; and a clergyman entirely overlooks the comic in the human weaknesses which the writer of comedies can bring to light so effectively. The comic process will not bear being hypercathected by attention; it must be able to take its course quite unobserved – in this respect, incidentally, just like jokes [p. 131 ff. above]. It would, however, contradict the nomenclature of the 'processes of consciousness' of which I made use, with good reason, in my *Interpretation of Dreams* if one sought to speak of the comic process as a necessarily unconscious one. It forms part, rather, of the preconscious; and such processes, which run their course in the preconscious but lack the cathexis of attention with which consciousness is linked, may aptly be given the name of 'automatic'. The process of comparing expenditures must remain automatic if it is to produce comic pleasure.

(*e*) The comic is greatly interfered with if the situation from which it ought to develop gives rise at the same time to a release of strong affect. A discharge of the operative difference is as a rule out of the question in such a case. The affects, disposition and attitude of the individual in each particular case make it understandable that the comic emerges and vanishes according to the standpoint of each particular person, and that an absolute comic exists only in exceptional instances. The contingency or relativity of the comic is therefore far greater than that of a joke, which never happens of its own accord but is invariably *made*, and in which the conditions under which it can find acceptance can be observed at the time at which it is constructed. The generation of affect is the most intense of all the conditions that interfere with the comic and its importance in this respect has been nowhere overlooked.[1] For this reason it has been said that the comic feeling comes easiest in more or less indifferent cases where the feelings and interests are not strongly involved. Yet precisely in cases where there is a release of affect one can observe a [221]

1 'It is easy for you to laugh; it means nothing more to you.'

particularly strong difference in expenditure bring about the automatism of release. When Colonel Butler[1] answers Octavio's warnings by exclaiming 'with a bitter laugh': '*Thanks* from the House of Austria!' his embitterment does not prevent his laughing. The laugh applies to his memory of the disappointment he believes he has suffered; and on the other hand the magnitude of the disappointment cannot be portrayed more impressively by the dramatist than by his showing it capable of forcing a laugh in the midst of the storm of feelings that have been released. I am inclined to think that this explanation would apply to every case in which laughter occurs in circumstances other than pleasurable ones and accompanied by intensely distressing or strained emotions.

(*f*) If we add to this that the generating of comic pleasure can be encouraged by any other pleasurable accompanying circumstance as though by some sort of contagious effect (working in the same kind of way as the fore-pleasure principle with tendentious jokes), we shall have mentioned enough of the conditions governing comic pleasure for our purposes, though certainly not all of them. We can then see that these conditions, as well as the inconstancy and contingency of the comic effect, cannot be explained so easily by any other hypothesis than that of the derivation of comic pleasure from the discharge of a difference which, under the most varying circumstances, is liable to be used in ways other than discharge.

[5]

The comic of sexuality and obscenity would deserve more detailed consideration; but we can only touch upon it here with a few comments. The starting point would once more [as in the case of obscene jokes, p. 85 above] be exposure. A chance exposure has a comic effect on us
[222] because we compare the ease with which we have enjoyed the sight with the great expenditure which would otherwise be required for reaching this end. Thus the case approaches that of the naively comic, but is simpler. Every exposure of which we are made the spectator (or audience in the case of smut) by a third person is equivalent to the exposed person being made comic. We have seen that it is the task of jokes to take the place of smut and so once more to open access to a lost source of comic

1 [In Schiller's tragedy *Wallensteins Tod* (Act II, Scene 6). Colonel Butler, a veteran Irish soldier in the Imperial army during the Thirty Years' War, believes that he has been snubbed by the Emperor and is preparing to desert to his enemies. Octavio Piccolomini, his superior officer, begs him to reconsider the position and reminds him of the thanks which Austria owes him for his forty years' loyalty, and to this Butler replies in the words quoted above.]

pleasure. As opposed to this, witnessing an exposure is not a case of the comic for the witness, because his own effort doing so does away with the determining condition of comic pleasure: nothing is left but the sexual pleasure in what is seen. If the witness gives an account to someone else, the person who has been witnessed becomes comic once more, because there is a predominant sense that the latter has omitted the expenditure which would have been in place for concealing his secret. Apart from this, the spheres of sexuality and obscenity offer the amplest occasions for obtaining comic pleasure alongside pleasurable sexual excitement; for they can show human beings in their dependence on bodily needs (degradation) or they can reveal the physical demands lying behind the claim of mental love (unmasking).

[6]

An invitation to us to look for an understanding of the comic in its psychogenesis is also to be found, surprisingly enough, in Bergson's charming and lively volume *Le rire*. We have already [p. 181 above] made the acquaintance of Bergson's formulas for grasping the characteristics of the comic: '*mécanisation de la vie*', '*substitution quelconque de l'artificiel au naturel*'.[1] He proceeds by a plausible train of thought from automatism to automata, and tries to trace back a number of comic effects to the faded recollection of a children's toy. In this connection he reaches for a moment a point of view, which, it is true, he soon abandons: he endeavours to explain the comic as an after-effect of the joys of childhood. 'Peut-être même devrions-nous pousser la simplification plus loin encore, remonter à nos souvenirs les plus anciens, chercher dans les jeux qui amusèrent l'enfant la première ébauche des combinaisons qui [223]
font rire l'homme . . . Trop souvent surtout nous méconnaissons ce qu'il y a d'encore enfantin, pour ainsi dire, dans la plupart de nos émotions joyeuses.' (Bergson, 1900, 68 ff.)[2] Since we have traced back jokes to children's play with words and thoughts which has been frustrated by rational criticism [p. 112 ff.] we cannot help feeling tempted to investigate the infantile roots which Bergson suspects in the case of the comic as well.

And, in fact, if we examine the relation of the comic to the child we

1 ['Mechanization of life' – 'some kind of substitution of the artificial for the natural'.]

2 ['Perhaps we should even carry simplification further still, go back to our oldest memories, and trace in the games that amused the child the first sketch of the combinations which make the grown man laugh. . . . Above all, we too often fail to recognize how much of childishness, so to speak, there still is in most of our joyful emotions.']

come upon a whole number of connections which seem promising. Children themselves do not strike us as in any way comic, though their nature fulfils all the conditions which, if we compare it with our own nature, yield a comic difference:[1] the excessive expenditure on movement as well as the small intellectual expenditure, the domination of the mental functions by the bodily ones, and other features. A child only produces a comic effect on us when he conducts himself not as a child but as a serious adult, and he produces it then in the same way as other people who disguise themselves. But so long as he retains his childish nature the perception of him affords us a pure pleasure, perhaps one that reminds us slightly of the comic. We call him naive, insofar as he shows us his lack of inhibition, and we describe as naively comic those of his utterances which in another person we should have judged obscenities or jokes.

On the other hand, children are without a feeling for the comic. This assertion seems to say no more than that the comic feeling, like such a number of other things, only starts at some point in the course of mental development; and this would be by no means surprising, especially as it has to be admitted that the feeling already emerges clearly at an age which has to be counted as part of childhood. But it can nevertheless be shown that the assertion that children lack the feeling of the comic contains more than something self-evident. In the first place, it is easy to see
[224] that it could not be otherwise if our view is correct which derives the comic feeling from a difference in expenditure that arises in the course of understanding another person. Let us once again take the comic of movement as an example. The comparison which provides the difference runs (stated in conscious formulas): 'That is how he does it' and 'This is how I should do it, how I did it'. But a child is without the standard contained in the second sentence; he understands simply by mimicry: he does it in just the same way. The child's upbringing presents him with a standard: 'this is how you ought to do it.' If he now makes use of this standard in making the comparison, he will easily conclude: 'he did not do it right' and 'I can do it better'. In this case he laughs at the other person, he laughs at him in the feeling of his own superiority. There is nothing to prevent our deriving this laughter too from a difference in expenditure; but on the analogy of the cases of laughing at people that we have come across we may infer that the comic feeling is not present in a child's superior laughter. It is a laughter of pure pleasure. In our own case when we have a clear judgement of our own superiority, we merely smile instead of laughing, or, if we laugh, we can nevertheless distinguish

1 [Cf. footnote 1, p. 163 above.]

this becoming conscious of our superiority from the comic that makes us laugh [pp. 170 and 173 above].

It is probably right to say that children laugh from pure pleasure in a variety of circumstances that we feel as 'comic' and cannot find the motive for, whereas a child's motives are clear and can be stated. For instance, if someone slips in the street and falls down we laugh because the impression – we do not know why – is comic. A child laughs in the same case from a feeling of superiority or from *Schadenfreude*: 'You've fallen down, I haven't.' Certain motives for pleasure in children seem to be lost to us adults, and instead in the same circumstances we have the 'comic' feeling as a substitute for the lost one.

If one might generalize, it would seem most attractive to place the specific characteristic of the comic which we are in search of in an awakening of the infantile – to regard the comic as the regained 'lost laughter of childhood'. One could then say: 'I laugh at a difference in expenditure between another person and myself, every time I rediscover the child in him.' Or, put more exactly, the complete comparison which leads to the comic would run: 'That is how he does it – I do it in another way – he [225] does it as I used to do it as a child.'

Thus the laughter would always apply to the comparison between the adult's ego [*Ich*][T] and the child's ego. Even the lack of uniformity in the comic difference – the fact that what seems to me comic is sometimes a greater and sometimes a smaller expenditure [p. 170 *n.*] – would fit in with the infantile determinant; actually what is comic is invariably on the infantile side.

This is not contradicted by the fact that, when children themselves are the object of the comparison, they do not give me a comic impression but a purely pleasurable one; nor is it contradicted because the comparison with the infantile only produces a comic effect if any other use of the difference is avoided. For these are matters concerned with the conditions governing *discharge*. Whatever brings a psychical process into connection with others operates against the discharge of the surplus cathexis and puts it to some other use; whatever isolates a psychical act encourages discharge [cf. p. 190]. A conscious attitude to children as objects of comparison therefore makes impossible the discharge that is necessary for comic pleasure. Only when the cathexis is *preconscious* [p. 191] is there an approximation to an isolation such as, incidentally, we may ascribe to the mental processes in children as well. The addition to the comparison ('I did it like that as a child too') from which the comic effect is derived would thus only come into consideration, as far as

differences of medium magnitude are concerned, if no other nexus could gain control over the liberated surplus.

If we pursue our attempt to discover the essence of the comic in a preconscious link with the infantile, we must go a step further than Bergson and admit that a comparison need not, in order to produce the comic, arouse old childish pleasures and childish play; it will be enough for it to touch upon childish nature in general, and perhaps even on childish suffering. Here we shall be parting from Bergson but remaining in agreement with ourselves if we connect comic pleasure not with recollected pleasure but once more with a comparison. It may be that cases of the former kind [those connected with recollected pleasure] may coincide with the invariably and irresistibly comic [pp. 189–90 above].

[226] Let us at this point review the scheme which we drew up earlier [p. 170] of the various comic possibilities. We remarked that the comic difference was found either

(*a*) by a comparison between another person and oneself, or
(*b*) by a comparison entirely within the other person, or
(*c*) by a comparison entirely within oneself.

In the first of these cases the other person would appear to me as a child; in the second he would reduce himself to a child; and in the third I should discover the child in myself.

[*a*] The first case would include the comic of movement and form, of mental functioning and of character. The corresponding infantile factors would be the urge to movement and the child's inferior mental and moral development. So that, for instance, a stupid person would be comic to me insofar as he reminded me of a lazy child and a bad person insofar as he reminded me of a naughty child. There could only be a question of a childish pleasure lost to adults in the single instance in which the child's own joy in movement was concerned.

[*b*] The second case, in which the comic depends entirely on 'empathy', includes the most numerous possibilities – the comic of situation, of exaggeration (caricature), of mimicry, of degradation and of unmasking. This is the case in which the introduction of the infantile point of view proves most useful. For the comic of situation is mostly based on embarrassments, in which we rediscover the child's helplessness. The worst of the embarrassments, the interference by the peremptory demands of natural needs with other functions, corresponds to the child's incomplete control over his bodily functions. Where the comic of situation operates by means of repetitions, it is based on the child's peculiar pleasure in constant repetition (of questions or of being

told stories) which make him a nuisance to the adult. [Cf. p. 113 *n*. above.] Exaggeration, which still gives pleasure to adults insofar as it can find justification with their critical faculty, is connected with the child's peculiar lack of a sense of proportion, his ignorance of all quantitative relations, which he comes to know later than qualitative ones. The use of moderation and restraint, even in the case of permitted impulses, is a late fruit of education and is acquired by the mutual inhibition of mental activities brought together in a combination. Where such combinations are weakened, as in the unconscious of dreams or in the mono-ideism of [227]
psychoneuroses, the child's lack of moderation re-emerges.[1]

We found relatively great difficulties in understanding the comic of mimicry so long as we left the infantile factor out of account. But mimicry is the child's best art and the driving motive [*treibende Motiv*] of most of his games. A child's ambition aims far less at excelling among his equals than at mimicking the grown-ups. The relation of children to adults is also the basis of the comic of degradation, which corresponds to the condescension shown by adults in their attitude to the life of children. There is little that gives children greater pleasure than when a grown-up lets himself down to their level, renounces his oppressive superiority and plays with them as an equal. This relief, which gives the child pure pleasure, becomes in adults, in the form of degradation, a means of making things comic and a source of comic pleasure. As regards unmasking, we know that it goes back to degradation.

[*c*] We come up against the most difficulties in finding the infantile basis of the third case, the comic of expectation, which no doubt explains why those authorities who have put this case first in their discussion of the comic have found no occasion for taking account of the infantile factor in the comic. The comic of expectation is no doubt the remotest in children; the capacity to grasp it is the latest to appear. In most of the instances which seem comic to an adult a child would probably feel only disappointment. We might, however, take the child's power of blissful expectation and credulity as a basis for understanding how we appear to ourselves comic 'as a child' when we meet with a comic disappointment.

What we have said would seem to suggest a certain probability for a translation of the comic feeling that might run: 'Those things are comic which are not proper for an adult.' Nevertheless, I do not feel bold enough, by virtue of my whole attitude to the problem of the comic, to

1 [This point had been brought out already by Freud in a footnote to *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 237–8 *n*. 2.]

defend this last assertion with as much seriousness as my earlier ones. I am unable to decide whether degradation to being a child is only a
[228] special case of comic degradation, or whether everything comic is based fundamentally on degradation to being a child.[1]

[7]

An enquiry which deals with the comic, however cursorily, would be seriously incomplete if it did not find room for at least a few remarks about *humour*. The essential kinship between the two is so little open to doubt that an attempt at explaining the comic is bound to make at least some contribution to an understanding of humour. However much that is pertinent and impressive may have been brought forward in the appreciation of humour (which, itself one of the highest psychical achievements, enjoys the particular favour of thinkers), yet we cannot evade an attempt at giving expression to its nature by an approach to the formulas for jokes and for the comic.

We have seen [p. 191 above] that the release of distressing affects is the greatest obstacle to the emergence of the comic. As soon as the aimless movement does damage, or the stupidity leads to mischief, or the disappointment causes pain, the possibility of a comic effect is at an end. This is true, at all events, for a person who cannot ward off such unpleasure, who is himself its victim or is obliged to have a share in it; whereas a person who is not concerned shows by his demeanour that the situation involved contains everything that is required for a comic effect. Now humour is a means of obtaining pleasure in spite of the distressing affects that interfere with it; it acts as a substitute for the generation of these affects, it puts itself in their place. The conditions for its appearance are given if there is a situation in which, according to our usual habits, we should be tempted to release a distressing affect and if motives then operate upon us which suppress that affect *in statu nascendi*. In the cases that have just been mentioned the person who is the victim of the injury, pain, and so on, might obtain *humorous* pleasure, while the uncon-
[229] cerned person laughs from *comic* pleasure. The pleasure of humour, if this is so, comes about – we cannot say otherwise – at the cost of a release of affect that does not occur: it arises from *an economy in the expenditure of affect*.

1 The fact that comic pleasure has its source in the 'quantitative contrast' of a comparison between small and large, which after all also expresses the essential relation between a child and an adult – this would certainly be a strange coincidence if the comic had no other connection with the infantile.

Humour is the most easily satisfied among the species of the comic. It completes its course within a single person; another person's participation adds nothing new to it. I can keep to myself the enjoyment of the humorous pleasure that has arisen in me, without feeling obliged to communicate it. It is not easy to say what happens in a person when humorous pleasure is generated; but we can obtain some insight if we examine the cases in which humour is communicated or sympathized with, cases in which, by an understanding of the humorous person, we arrive at the same pleasure as his. The crudest case of humour – what is known as *Galgenhumor* [literally 'gallows humour'] – may be instructive in this connection. A rogue who was being led out to execution on a Monday remarked: 'Well, this week's beginning nicely.'[1] This is actually a joke, since the remark is quite apt in itself, but, on the other hand, is misplaced in a nonsensical way, since for the man himself there would be no further events that week. But humour is concerned in the *making* of such a joke – that is, in disregarding what it is that distinguishes the beginning of this week from others, in denying the distinction which might give rise to motives for quite special emotions. The case was the same when the rogue on his way to execution asked for a scarf for his bare throat so as not to catch cold – an otherwise laudable precaution but one which, in view of what lay in store so shortly for the neck, was remarkably superfluous and unimportant. It must be confessed that there is something like magnanimity in this *blague*, in the man's tenacious hold upon his customary self and his disregard of what might overthrow that self and drive it to despair. This kind of grandeur of humour appears unmistakably in cases in which our admiration is not inhibited by the circumstances of the humorous person.

In Victor Hugo's *Hernani*, the bandit who has become involved in a conspiracy against his king, Charles I of Spain (the Emperor Charles V), has fallen into the hands of this powerful enemy. He foresees that, convicted of high treason, it is his fate to lose his head. But this foreknowledge does not prevent his letting himself be known as a [230]
hereditary grandee of Spain and declaring that he has no intention of renouncing any of the privileges that are his due. A grandee of Spain might cover his head in the presence of his royal master. Very well, then:

1 [The anecdote is discussed again in Freud's late paper on 'Humour' (1927*d*), *RSE*, **21**, 147.]

. . . Nos têtes ont le droit
De tomber couvertes devant de toi.[1]

This is humour on the grand scale, and if when we hear it we do not laugh, that is because our admiration covers the humorous pleasure. In the case of the rogue who refuses to catch cold on the way to execution we laugh heartily. The situation that ought to drive the criminal to despair might rouse intense pity in us; but that pity is inhibited because we understand that he, who is more closely concerned, makes nothing of the situation. As a result of this understanding, the expenditure on the pity, which was already prepared, becomes unutilizable and we laugh it off. We are, as it were, infected by the rogue's indifference – though we notice that it has cost him a great expenditure of psychical work.

An economy of pity is one of the most frequent sources of humorous pleasure. Mark Twain's humour usually works with this mechanism. In an account of his brother's life, for instance, he tells us how he was at one time employed on a great road-making enterprise. The premature explosion of a mine blew him up into the air and he came down again far away from the place where he had been working. We are bound to have feelings of sympathy for the victim of the accident and would like to ask whether he was injured by it. But when the story goes on to say that his brother had a half-day's wages deducted for being 'absent from his place of employment' we are entirely distracted from our pity and become almost as hard-hearted as the contractor and almost as indifferent to possible damage to the brother's health. On another occasion Mark Twain presents us with his family tree, which he traces back to one of Columbus's fellow voyagers. He then describes this ancestor's character and how his baggage consisted entirely of a number of pieces of washing each of which had a different laundry-mark – here we cannot help laughing at the cost of an economy of the feelings of piety into
[231] which we were prepared to enter at the beginning of this family history. The mechanism of the humorous pleasure is not interfered with by our knowledge that this pedigree is a fictitious one and that the fiction serves the satirical purpose of exposing the embellishments in similar accounts by other people: it is as independent of the condition that it must be real as in the case of making things comic [pp. 172–3 above]. In yet another story, Mark Twain describes how his brother constructed a

1 ['Our heads have the right to fall before you covered.' – The editors of the *Oeuvres complètes de Freud* point out that Freud slightly misquoted Hugo here. The essential meaning is unaffected by the error but the quote should read: 'Oui, nos têtes, ô roi, Ont le droit de tomber couvertes devant toi!']

subterranean dwelling, into which he brought a bed, a table and a lamp and which he roofed over with a large piece of sailcloth with a hole in the middle. At night, however, after the hut was finished, a cow that was being driven home fell through the opening of the roof on to the table and put out the lamp. His brother patiently helped to get the beast out and put the establishment to rights again. Next night the same interruption was repeated and his brother behaved as before. And so it was every following night. Repetition makes the story comic, but Mark Twain ends it by reporting that on the forty-sixth night, when the cow fell through again, his brother finally remarked: 'The thing's beginning to get monotonous.' At this our humorous pleasure cannot be kept back, for what we had long expected to hear was that this obstinate set of misfortunes would make his brother *angry*. And indeed the small contributions of humour that we produce ourselves are as a rule made at the cost of anger – instead of getting angry.[1]

The species of humour are extraordinarily variegated according to the nature of the emotion [*Gefühlserregung*] which is economized in favour [232]
of the humour: pity, anger, pain, tenderness, and so on. Their number seems to remain uncompleted because the kingdom of humour is constantly being enlarged whenever an artist or writer succeeds in submitting some hitherto unconquered emotions to the control of humour, in making them, by devices like those in the examples we have given,

1 The grandiose humorous effect of a figure like that of the fat knight Sir John Falstaff rests on an economy in contempt and indignation. We recognize him as an undeserving gormandizer and swindler, but our condemnation is disarmed by a whole number of factors. We can see that he knows himself as well as we do; he impresses us by his wit [see Editors' Preface, p. 6 above], and, besides this, his physical misproportion has the effect of encouraging us to take a comic view of him instead of a serious one, as though the demands of morality and honour must rebound from so fat a stomach. His doings are on the whole harmless, and are almost excused by the comic baseness of the people he cheats. We admit that the poor fellow has a right to try to live and enjoy himself like anyone else, and we almost pity him because in the chief situations we find him a plaything in the hands of someone far his superior. So we cannot feel angry with him and we add all that we economize in indignation with him to the comic pleasure which he affords us apart from this. Sir John's own humour arises in fact from the superiority of an ego which neither his physical nor his moral defects can rob of its cheerfulness and assurance.

The ingenious knight Don Quixote de la Mancha is, on the contrary, a figure who possesses no humour himself but who with his seriousness offers us a pleasure which could be called humorous, though its mechanism shows an important divergence from that of humour. Don Quixote is originally a purely comic figure, a big child; the phantasies from his books of chivalry have gone to his head. It is well known that to begin with the author intended nothing else of him and that his creation gradually grew far beyond its creator's first intentions. But after the author had equipped this ridiculous figure with the deepest wisdom and the noblest purposes and had made him into the symbolic representative of an idealism which believes in the realization of its aims and takes duties seriously and takes promises literally, this figure ceased to have a comic effect. Just as in other cases humorous pleasure arises from the prevention of an emotion, so it does here from the interference with comic pleasure. But it is clear that these examples have already carried us a long way from the simple cases of humour.

into sources of humorous pleasure. The artists in *Simplicissimus*,[1] for instance, have had astonishing results in achieving humour at the cost of horror and disgust. The forms in which humour is manifested are, moreover, determined by two peculiarities which are connected with the conditions under which it is generated. Humour may, in the first place, appear merged with a joke or some other species of the comic; in that case its task is to get rid of a possibility implicit in the situation that an affect may be generated which would interfere with the pleasurable outcome. In the second place, it may stop this generating of an affect entirely or only partially; this last is actually the commoner case since it is easier to bring about, and it produces the various forms of 'broken'[2] humour – the humour that smiles through tears. It withdraws a part of its energy from the affect and in exchange gives it a tinge of humour.

[233] The humorous pleasure derived from sympathy originates, as can be seen from the examples above, from a peculiar technique comparable to displacement, by means of which the release of affect that is already in preparation is disappointed and the cathexis diverted on to something else, often on to something of secondary importance. But this does not help us at all to understand the process by which the displacement away from the generating of affect takes place in the humorous person himself. We can see that the receiver imitates the creator of the humour in his mental processes, but this tells us nothing of the forces which make the process possible in the latter.

We can only say that if someone succeeds, for instance, in disregarding a painful affect by reflecting on the greatness of the interests of the world as compared with his own smallness, we do not regard this as an achievement of humour but of philosophical thought, and if we put ourselves into his train of thought, we obtain no yield of pleasure. Humorous displacement is thus just as impossible under the glare of conscious attention as is comic comparison [p. 191 above]; like the latter, it is tied to the condition of remaining preconscious or automatic.

We can gain some information about humorous displacement if we look at it in the light of a defensive process. Defensive processes are the psychical correlative of the flight reflex and perform the task of preventing the generation of unpleasure from internal sources. In fulfilling this task they serve mental events as an automatic regulation, which in the end, incidentally, turns out to be detrimental and has to be subjected to conscious thinking. I have indicated one particular form of this defence,

1 [See footnote, p. 64 above.]

2 A term which is used in quite another sense in Vischer's aesthetics.

repression that has failed, as the operative mechanism for the development of psychoneuroses. Humour can be regarded as the highest of these defensive processes. It scorns to withdraw the ideational content bearing the distressing affect from conscious attention as repression does, and thus surmounts the automatism of defence. It brings this about by finding a means of withdrawing the energy from the release of unpleasure that is already in preparation and of transforming it, by discharge, into pleasure. It is even conceivable that once again it may be a connection with the infantile that puts the means for achieving this at its disposal. Only in childhood have there been distressing affects at which the adult would smile today – just as he laughs, as a humorist, at his present distressing affects. The exaltation of his ego, to which the humorous [234]
displacement bears witness, and of which the translation would no doubt be 'I am too big (too fine)[1] to be distressed by these things', might well be derived from his comparing his present ego with his childish one. This view is to some extent supported by the part played by the infantile in neurotic processes of repression.

On the whole humour is closer to the comic than to jokes. It shares with the former its psychical localization in the preconscious, whereas jokes, as we have had to suppose, are formed as a compromise between the unconscious and the preconscious. On the other hand, humour does not participate in a peculiar characteristic common to jokes and the comic, on which we have perhaps not yet laid sufficient stress. It is a necessary condition for generating the comic that we should be obliged, *simultaneously or in rapid succession*, to apply to one and the same act of ideation two different ideational methods, between which the 'comparison' is then made and the comic difference emerges [p. 170 above]. Differences in expenditure of this kind arise between what belongs to someone else and to oneself, between what is as usual and what has been changed, between what is expected and what happens.[2] In the case of jokes, the difference between two simultaneous methods of viewing things, which operate with a different expenditure, applies to the process in the person who hears the joke. One of these two views, following the hints contained in the joke, passes along the path of thought through the unconscious; the other stays on the surface and views the joke like any

1 [In the original '*gross*(*artig*)'.]

2 If we are prepared to do a little violence to the concept of 'expectation', we can, following Lipps, include a very large region of the comic under the comic of expectation. But what are probably the most basic instances of the comic, those arising from a comparison between someone else's expenditure and one's own, would be the very ones that fitted in least easily to this grouping.

other wording that has emerged from the preconscious and become conscious [p. 186 f. above]. We should perhaps be justified in representing the pleasure from a joke that is heard as being derived from the difference between these two methods of viewing it.[1] Here we are saying of jokes
[235] what we described [p. 186] as their possessing a Janus head, while the relation between jokes and the comic had still to be cleared up.[2]

In the case of humour the characteristic which we have just brought forward becomes effaced. It is true that we feel humorous pleasure when an emotion is avoided which we should have expected because it usually accompanies the situation, and to that extent humour too comes under the extended concept of the comic of expectation. But with humour it is no longer a question of two different methods of viewing the same subject matter. The fact that the situation is dominated by the emotion that is to be avoided, which is of an unpleasurable character, puts an end to the possibility of comparing it with the characteristics of the comic and of jokes. Humorous displacement is in fact a case of a liberated expenditure being used elsewhere – a case which has been shown to be so perilous to a comic effect [p. 189].[3]

[8]

We are now at the end of our task, having reduced the mechanism of
[236] humorous pleasure to a formula analogous to those for comic pleasure and for jokes. The pleasure in jokes has seemed to us to arise from an *economy in expenditure upon inhibition*, the pleasure in the comic from an *economy in expenditure upon ideation* (upon cathexis) and the

1 We can accept this formula without question, since it leads to nothing that would contradict our earlier discussions. The difference between the two expenditures must in essence come down to the inhibitory expenditure that is saved. The lack of this economy in inhibition in the case of the comic, and the absence of quantitative contrast in the case of jokes, would determine the distinction between the comic feeling and the impression of a joke, in spite of their agreeing in the characteristic of using two kinds of ideational activity for the same view.

2 This peculiarity of the '*double face*' [in French in the original] has naturally not escaped the authorities. Mélinand (1895), from whom I have borrowed this phrase, states the determinants of laughter in the following formula: 'Ce qui fait rire c'est ce qui est à la fois, d'un côté, absurde et de l'autre, familier.' ['What makes one laugh is what is on the one hand absurd, and on the other familiar.'] This formula fits jokes better than the comic, but does not completely cover the former either. – Bergson (1900, 98) defines the comic situation by the 'interférence des séries': 'Une situation est toujours comique quand elle appartient en même temps à deux séries d'événements absolument indépendantes, et qu'elle peut s'interpréter à la fois dans deux sens tout différents.' ['A situation is always comic when it belongs at the same time to two series of events that are absolutely independent, and when it can be interpreted simultaneously in two quite different senses.'] – Lipps regards the comic as 'the bigness and smallness of the same thing'.

3 [Over twenty years after the publication of this book, Freud returned to the subject of humour in a short paper (1927*d*), reflecting his new views on mental structure. Cf. *RSE*, **21**, 147 ff.]

pleasure in humour from an *economy in expenditure upon feeling*. In all three modes of working of our mental apparatus the pleasure is derived from an economy. All three are agreed in representing methods of regaining from mental activity a pleasure which has in fact been lost through the development of that activity. For the euphoria which we endeavour to reach by these means is nothing other than the mood of a period of life in which we were accustomed to deal with our psychical work in general with a small expenditure of energy – the mood of our childhood, when we were ignorant of the comic, when we were incapable of jokes and when we had no need of humour to make us feel happy in our life.

APPENDIX

FRANZ BRENTANO'S RIDDLES

[237] The account of Franz Brentano's riddles given by Freud in his footnote on p. 28 *n. 6* above is so obscure that a further explanation is called for. In 1879 Brentano (under the pseudonym of 'Aenigmatias') published a booklet of some two hundred pages with the title *Neue Räthsel* ('New Riddles'). It included specimens of various different types of riddle, the last of which was described as '*Füllräthsel*' – 'fill-up riddles'. He gives an account of these in the introduction to the booklet. According to him, this type of riddle was a favourite pastime in the Main region of Germany, but had only recently reached Vienna. The booklet includes thirty examples of the 'fill-up riddles', among them the two quoted, not quite accurately, by Freud. A complete translation of these will be the simplest way of making their construction plain:

XXIV

'How our friend is plagued by his belief in premonitions! The other day, when his mother was ill, I found him sitting under a tall tree. The wind was blowing through its branches, so that some of its large leaves came away, and one of them happened to fall in his lap. Thereupon he burst into tears. His mother, he moaned, was going to die: *das lasse ihn das herabgefallene* [literally: this he was led by the fallen] daldaldal – daldaldal.'

Answer: '*Platanenblatt ahnen*' [plane tree leaf to think].

XXVIII

'A man from Hindustan fell ill. His doctor was in the act of writing him out a prescription when he was suddenly called away by an urgent message. He finished writing out the prescription as quickly as possible and went off on the other call. Soon afterwards the news reached him that the Asian, hardly had he tasted the drug prepared for him, had died in convulsions. "Unhappy wretch!" the doctor said to himself in horror. "What have you done? Is it possible that you *indem du den Trank dem* [literally: when you the potion for the] daldaldaldaldaldal – daldaldaldaldaldal?"'

[238] Answer: '*Inder hast verschrieben, in der Hast verschrieben*' [Indian prescribed, in your haste made a slip of the pen].

An English specimen may make things clearer still:

'Burglars had broken into a large furriers' store. But they were disturbed and went off without taking anything, though leaving the showroom in the greatest

confusion. When the manager arrived in the morning, he gave instructions to his assistants: "Never mind about the cheaper goods. The urgent thing is to get the daldal – daldal.'"

Answer: 'first-rate furs straight.'

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

  Clerics, Catholic and Protestant (Heine), 76–7, 79, 126
  Face a palimpsest (Heine), 76
  Foundations *pro* and *contra* (Lichtenberg), 80
  Learned entrails (Lichtenberg), 74
  Learned stall-feeding (Lichtenberg), 74
  Motives and points of the compass (Lichtenberg), 75
  Octavo and Quarto (Lichtenberg), 80
  Philosophy and moonlight (Lichtenberg), 76, 79
  Poetry and picnic (Lichtenberg), 76
  Scarlet thread (Goethe), 21–2, 72
  Science and the Workers (Lassalle), 72
  Thought, life history of a (Lichtenberg), 80
  Torch of truth (Lichtenberg), 72, 82, 183
  Warehouse of memory (Nestroy), 75, 183
  Weather side of moral constitution (Lichtenberg), 74
  Zweischläfrig, *einschläfrig* (Lichtenberg), 76
Andrássy, Count, 180
Anecdotage (De Quincey), 20
Antesemitism (Herr N.), 29–30
Antik? Oh, nee, 28, 31, 38, 41

Banko (Heine), 32
Bath jokes (Jewish), 43, 45, 46–7, 49, 63, 68
Biting satire (Heine), 33

Blind man and lame man (Lichtenberg), 30
Box on the ears (Karl Kraus), 68
Bubizin (naive), 158–9, 162
Buonaparte, 28
Bürger Ministry, 115 *n.* 1

Caesars – caesuras (Hevesi), 40
Cake and liqueur, 53, 177
Calcutta (Heine), 41
Carthaginoiserie (Sainte-Beuve), 20
Cat's skin (Lichtenberg), 52–3, 82
Childbirth, Baroness in, 71, 175
Citation (Heine), 35
Cleopold, 19
Crown Princess Louise, 108

Deafness and brandy, 100
Deathbed joke (Heine), 100–1
Dichteritis, 67–8
Dipsomaniac tutor, 46, 96
Doctor and patient's looks, 33
Duke and dyer, 60, 61

Eifersucht (jealousy) (Schleiermacher), 31, 35, 38, 114
Every fathom a queen, 67
Experience defined, 58, 81

Facetious questions, 133 *n.* 1, 187
Famillionaire (Heine), 12, 15–18, 19–20, 41, 122–3, 124
Family of absent fisherman (naive), 159
Fellow unbeliever (Heine), 68
Food in the beard (Jewish), 63
Forckenbecken (Berliners), 19
Fork and stew, 61, 184
Frederick the Great and the preacher, 61
Frenchwoman (naive), 160
Future behind him, a great (Herr N.), 23–4, 186

Galathea's black hair (Lessing), 63
Galgenhumor, 199–200
Ghosts, disbelief in (Lichtenberg), 80
Girl at her toilet, 83
Golden Calf (Soulié – Heine), 42–3, 45, 47, 49
Göttingen inhabitants (Heine), 60, 184
Great Spirit (Lichtenberg), 62

Hamlet on philosophy (Lichtenberg), 63

Healers and Howlers (Rokitansky), 114
Hof and *Freiung* (Viennese), 32
Home-Roulard, 83, 106 and *n.* 1, 108
Horse dealer and Pressburg, 48, 133 *n.* 1
Human handiwork and child, 52, 66
Human life in two halves, 58–9

Ideal vor dem Kopf, 67, 186
Innkeeper's whitlow, 60
Innocence (Dreyfus), 35, 108
Iron (Spitzer), 35, 38
Itzig in the artillery (Jewish), 50, 51

January good wishes (Lichtenberg), 58–9, 81
Jew on the railway train, 70–1, 98

Ka-Lauer, 42
Kettle, damaged, 55, 178–9
Knife without a blade (Lichtenberg), 53 *n.* 1

Labeo ait, 30
Laryngoscope (Schnitzler), 32
Latin at school (Heine), 60–1
Life a suspension bridge, 121 *n.* 1
Lohengrin and the French, 32

Maintenon, Madame de, 180
Mayonnaise and spinach, 121 *n.* 1
Millionarr (Heine), 18
Monumentan, 19
Mr and Mrs X (Spitzer), 29, 36, 66

Naive jokes, 158–60, 161–3
New spas cure well (Lichtenberg), 66–7, 186

O na, nie!, 28
Orient Express (Karl Kraus), 24

Phocion and applause, 52
Pistol (Shakespeare), 32
Platen, Count von (Heine), 69–70
Plough, before the (Herr N.), 24, 91
Pregnant daughter, 51
Prince and telescope (Kästner), 180
Professors ordinary and extraordinary, 34–5
Professors without names (Heine), 34

Rabbi, long-sighted, 55–6, 100
Riddles
  Daldaldal (Brentano), 28 *n.* 6, 206
  Fechner's, 59 *n.* 1
  Schleiermacher's, 59 *n.* 1
Roter Fadian (Herr N.), 20–2, 91
Rothschild and Saphir, 33–4, 38
Round the Wilt in 80 Days, 67
Rousseau, J. B., and posterity (Voltaire), 60
Roux-sot, 27–8, 31, 38

Salinger (Viennese), 19
Salmon mayonnaise (Jewish), 44–7, 49, 95–6, 177
Saviour, the, and the two thieves, 65–6, 103
Schadchen jokes (Jewish marriage broker)
  Bride's silver plate, 57, 92–4, 175–6
  Deaf bride, 56–7, 92–4
  Faultless bride, 54, 94–5
  Humpbacked bride, 56–7, 175–6
  Lame bride, 55, 56, 94–5
  Prison, life in, 48–9
  Three matches, 95
Schnorrer jokes (Jewish beggar)
  Bad-tempered baron, 99
  Heart-broken baron, 99
  Ostend, visit to, 49, 99
  Son-in-law to dinner, 98–9
Self-praise stinks, 68
Serenissimus and paternity, 60, 91–2, 103
Spoonerism (in rhyme), 80
Statues in Berlin, 34
Sujet (Louis XV), 33
Surgeon and king, 63–4

Tailor wrongly hanged, 178
Taking something in a café, 45 *n.* 2
Tête-à-bête (Herr N.), 22–3, 67
Thirty Years' War (Kästner), 114
Tobacco manufacture (Hevesi), 180
Traduttore – Traditore!, 5, 30, 106 *n.* 1

Abstract
  jokes (*see* Innocent jokes)
  thought (*see also* Ideation, economy of psychical expenditure in; Ideational mimetics; Intellectual), 168, 172, 174, 182–3, 190
Absurdity
  as joke technique (*see* Nonsense; Nonsensical jokes)
  in dreams, 139, 152
Active and passive, 86
Activity, jokes as a form of, 9–10, 13, 156
'*Aenigmatias*' (see *Brentano, F.*)
Aesthetic assistance, *Fechner's* principle of, 118–20
Aesthetics, 9–10, 84, 104, 106–7, 119, 120 *n.* 2
Affect
  expenditure of, and humour, 198–203, 204–5
  in dreams, 120 *n.* 1, 139
  release of, inhibits the comic, 191–2, 198
Agamemnon, 82
Aggressive jokes, 85, 87–8, 90–2, 95, 101, 117–18, 124–6, 131, 157
Aggressiveness
  in the comic, 164, 173
  sexual, 87–8, 90
Alexander the Great, 62
Allusion (*see also* Indirect representation)
  as joke technique, 23 *n.* 4, 36–7, 65–70, 76, 88, 92, 97, 106, 130, 132, 145–6, 150, 160, 179, 183
  in dreams, 78, 149–50
Amalgamations (*see also* Unification as joke technique), 185–7
American jokes, 65–6
Anal jokes, 69 and *n.* 2
Analogies
  borrowed kettle, 178
  business economy, 136
  economical housewife, 39
  electricity replacing gas, 136–7
  good watch movement and valuable case, 81
  Janus, 134–5, 186, 204
  military mobilization, 131, 168, 171
Analogy (*see also* Indirect representation)
  as joke technique, 71–7, 79–82, 140, 182
  in dreams, 78, 149
Andrássy, G., 180 and *n.* 3
Antigone (by *Sophocles*), 28, 31, 38, 41
Anxiety dreams, 139
Ariadne, 185
Aristotle, 107
Association of ideas (*see* Free association and dreams)
Attention, 141, 163, 168, 172
  distraction of, as joke technique, 131–2, 158
  inhibiting effect of, on the comic, 191, 202
Automatism
  of joking process, 56–7, 92–3, 132–3, 134, 191–3, 202–3
  psychical, unmasking of, 57, 175–6, 179, 181

'Bäder von Lucca, Die', *Reisebilder* (by *H. Heine*), 12, 15, 69–70, 76–7, 122–3

Bain, A. (*see also* Bibliography), 128, 173 *n.* 3
Berchtesgaden, 4
Bergson, H. (*see also* Bibliography), 163 *n.* 3, 181–2, 193, 196, 204 *n.* 2
Berlin, 19, 28, 34
Bewilderment and illumination as explanation of jokes, 11–13, 15, 31, 52, 68, 74–6, 81, 97, 108, 115, 121 *n.* 1, 134, 138, 180
Bierschwefel, 111
Blasphemous jokes, 100–1
Bleuler, E. (*see also* Bibliography), 152 *n.* 2
Bodily needs and comic degradation, 175, 193–4, 196
Böhme, J., 76
Bonaparte, Napoleon I, 20–2, 28, 91
Bonaparte, Napoleon III, 33
Brentano, F. (*see also* Bibliography), 5, 28 *n.* 6, 206–7
Brevity of jokes (*see also* Condensation; Economy), 13–14, 16–17, 25, 29–30, 31, 37–40, 104–6, 108, 132, 136, 146–7
Brill, A. A. (*see also* Bibliography), 20, 28, 29 *n.* 2, 30 *n.* 3
Brutus (in *Julius Caesar*), 64
Bürger Ministry in Austria, 115 *n.* 1
Butler, Colonel (in *Wallensteins Tod*), 192 and *n.* 1

Cäcilie M., Frau, case of (*see* Case of *Frau Cäcilie M.*)
Calcutta, 41
Caricature, 9–10, 13–14, 92, 153, 164, 173–5, 181, 196
Carthage, 20
Case
of '*Dora*', 5
of '*Little Hans*', 105 *n.* 2
of *Frau Cäcilie M.*, 4
of *Fräulein Elisabeth von R.*, 4
of '*Rat Man*', 68 *nn.* 1 & 2, 70 *n.* 1
Censorship, 89, 143, 147–50, 160–1
Cervantes, 62, 123, 201 *n.* 1
Character traits as comic material, 168–70, 173–5, 201 *n.* 1
Charles V, the Emperor, 199–200
Children (*see also* Infantile)
and the comic, 164–5, 167, 193–8
and the naive, 158–60, 162, 193–4
dreams of, 140
hostile impulses of, 90
laughter of, 194–5
play of, 106–7, 112–13, 147–8, 195–6, 197
pleasure in nonsense of, 110–11, 113, 193
pleasure in repetition of, 113 *n.* 1, 196–7
rebel against reality, 110–11
tend to treat words as things, 106 and *n.* 1
thought processes of, 147–8
unconscious mental processes of, 147–8
Cincinnatus, 24
Civilization, 89–90, 97, 169
Clark University, Worcester, Mass., 65 *n.* 2
Clichés, 72–3
Clio, 186
Collections and Recollections (by *G. W. E. Russell*), 159 *n.* 1
Columbus, 200
Comic
façade, 93–4, 133
nonsense, 153, 168–9, 184–7, 191
Comic, the (*see also* Degradation as comic technique; Exaggeration; Expectation and the comic; Mimicry; Movement, exaggerated expenditure on, and the comic; Obscenity and the comic; Parody; Psychical expenditure, difference in, as source of the comic; Psychical expenditure, exaggerated, as source of the comic; Situation, comic of; Travesty; Unmasking and the comic)
aggressiveness in, 164, 173
and character traits, 168–70, 173–5, 201 *n.* 1
and children, 164–5, 167, 193–8
and feelings of superiority, 169–70, 173, 195, 197
and fore-pleasure, 133
and physical traits, 91, 201 *n.* 1

and repetition, 201
and the unconscious, 147–8, 177–9, 180, 191
definition of, 6
infantile source of, 193–8, 205
of comparison, 168–70, 181–4, 191, 194–6, 202–4
of speech, 184–8
of words, 184–8
pleasure in, 163–4, 168–70, 173, 175, 177–83, 187–93, 197–8, 204–5
relation of humour to, 198–9, 202, 203–5
relation of jokes to, 9–10, 12–13, 57, 61, 84, 90–1, 125–6, 151, 157–64, 175–84, 186–9, 203–4
relation of the naive to, 162–3, 192–3
Communicate, urge to, 124–5, 134–5
Comparison and the comic (*see also* Contrast as joke technique; Psychical expenditure, difference in, as source of the comic; Small and large, contrast between), 168–70, 181–4, 191, 194–6, 202–4
Complete Neuroscientific Works of Sigmund Freud, 105 *n*. 1
Component drives, 86–7, 124–5
Composite structures
in dreams, 26, 152
jokes as, 16–21, 22–3, 36, 41
Compromise formations
dreams as, 149, 155, 176
jokes as, 120–1, 149, 176–7, 203
Conceptual jokes, 10–11, 65–6, 70, 77, 81, 92, 94, 101, 109, 125–6
and verbal jokes, 65 *n*. 1, 79–82, 85, 88, 112, 114, 121 *n*. 1
Condensation (*see also* Brevity of jokes)
in dreams, 26, 138, 142–4, 146–7, 148
in forgetting, 146 *n*. 1
in jokes, 18–30, 36–9, 41, 58–9, 67–8, 77, 83, 138, 143–5, 146–9, 156
Consciousness
and the unconscious, 140–1, 176
censorship of, 147–50
exclusion from, 89, 118, 128 and *n*. 2, 140, 202–4
Contest of Homer and Hesiod, 50 *n*. 1
Contrast as joke technique (*see also* Comparison and the comic; Small and large, contrast between), 10–12, 13, 31, 134, 163, 172, 189, 204 *n*. 1
'Contrectation', drive of (*Moll*), 86 *n*. 2
Criticism (*see also* Judgements)
concealed in jokes, 38, 90–4, 96–101, 124
rational, inhibiting effect of, 110–17, 120–1, 135, 147
renunciation of, in dream interpretation, 139
Cynical jokes, 95–101, 117, 153

Darwin, C., 127 *n*. 2
Day's residues, 139–40, 143
Defence
aggressive jokes as, 85
humour as, 203–4
repartee as, 60
Deferred action (see *Nachträglichkeit*)
Degradation as comic technique, 75, 76–7, 173–5, 181–3, 193–4, 196–8

THE COMPLETE PSYCHOLOGICAL WORKS
OF SIGMUND FREUD

VOLUME IX

‘Gradiva’

'Gradiva'

In a letter to his wife Martha dated September 24, 1907, while Freud was visiting Rome, he wrote: 'Just imagine my joy when, after being alone so long, I saw today in the Vatican a dear familiar face! The recognition was one-sided however, for it was the Gradiva.'

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

DELUSIONS AND DREAMS IN JENSEN'S *GRADIVA*

(1907 [1906])

EDITORS' NOTE

DER WAHN UND DIE TRÄUME IN W. JENSENS *'GRADIVA'*

GERMAN EDITIONS

1907 Leipzig and Vienna: Heller. Pp. 81. (*Schriften zur angewandten Seelenkunde*, Heft 1.) (Reissued unchanged with the same title page but a new paper outer cover: Leipzig and Vienna: Deuticke, 1908.) [3]
1912 2nd ed. Leipzig and Vienna: Deuticke. With 'Postscript'. Pp. 87.
1924 3rd ed. Same publishers. Unchanged.
1925 *GS*, **9**, 273–367.
1941 *GW*, **7**, 31–125.
1969 *SA*, **10**, 68–126. (Revised reprint of the *GW* version.)
1995 Frankfurt: Fischer Taschenbuch Verlag. With Jensen's text and Freud's previously unpublished working notes in the margins, from his own copy. Pp. 218.

ENGLISH TRANSLATIONS

Delusion and Dream
1917 New York: Moffat, Yard. Pp. 243. (Tr. H. M. Downey.) (With an introduction by G. Stanley Hall. Omits Freud's 'Postscript'. Includes translation of Jensen's story.)
1921 London: George Allen & Unwin. Pp. 213. (A reprint of the above.)

1959 *SE*, **9**, 7–93. With Postscript. (Tr. J. Strachey.)
1985 *PFL*, **14**, 33–118. (Reprint of the *SE* translation.)

The present translation is a revised and corrected reprint of the *SE* version.

This was Freud's first published analysis of a work of literature, apart, of course, from his comments on *Oedipus Rex* and *Hamlet* in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 231–6. At an earlier date, however, he had written a short analysis of Conrad Ferdinand Meyer's story 'Die Richterin' ['The Woman Judge'], and had sent it to Fliess, enclosed in a letter dated June 20, 1898 (Freud, 1950*a*, Letter 91). [4]

It was not Jung, as Ernest Jones (1955, 382) tells us, who brought Jensen's[1] book to Freud's notice. Bernd Urban's introduction to the 1995 German edition listed above reprints a letter from Wilhelm Stekel to Jensen, dated March 20, 1902, in which he informs him that Freud's Psychological Wednesday Society had discussed *Gradiva* in their last session, in light of its remarkable consistency with Freud's theories, and enquires as to whether or not Jensen was familiar with those theories (p. 17 f.). Combining this fact with Freud's remarks on pp. 7 and 71 below regarding the member of his circle who first had the idea of interpreting Jensen's dream creations, it is evident that this person was in fact Stekel. Jung therefore merely renewed Freud's interest in Jensen's *Gradiva* when he brought it back to his attention in the summer of 1906, several months before the two men actually met each other. According to Jones, Jung believed that Freud then wrote the present work especially to please him. In any event, this heralded their five or six years of cordial relations. Freud's study was published in May, 1907, and soon afterwards he sent a copy of it to Jensen. A short correspondence followed, which is referred to in the 'Postscript' to the second edition (p. 74); Jensen's side of this correspondence (three shortish letters, dated May 13, May 25, and December 14, 1907) was published in the *Psychoan. Beweg.*, **1** (1929), 207–11. The letters are most friendly in tone and give the impression that Jensen was flattered by Freud's analysis of his story. He appears even to have accepted the main lines of the interpretation. In particular, he declares that he has no recollection of having replied 'somewhat brusquely' when, as reported above, he was asked by Stekel whether he knew anything of Freud's theories.

Apart from the deeper significance which Freud saw in Jensen's work, there is no doubt that he must have been specially attracted by the scene in which it was laid. His interest in Pompeii was an old-established one. It appears more than once in his correspondence with Fliess. Thus, as an association to the word '*via*' in one of his dreams,[2] he gives 'the streets of Pompeii which I am studying'. This was on April 28, 1897 (Freud, 1950*a*, Letter 60), several years before he actually visited Pompeii, in
[5] September, 1902. Above all, Freud was fascinated by the analogy between the historical fate of Pompeii (its burial and subsequent excavation) and the mental events with which he was so familiar – burial by repression and excavation by analysis. Something of this analogy was suggested by Jensen himself (p. 31 below), and Freud enjoyed elaborating it here as well as in later contexts.

In reading Freud's study, it is worth bearing in mind its chronological place in his writings as one of his earlier psychoanalytic works. It was written only a year after the first publication of the 'Dora' case history and the *Three Essays on Sexuality*. Embedded in the discussion of *Gradiva*, indeed, there lies not only a summary of Freud's explanation of dreams but also what is perhaps the first of his semi-popular accounts of his theory of the neuroses and of the therapeutic action of psychoanalysis. It is impossible not to admire the almost prestidigital skill with which he extracts this wealth of material from what is at first sight no more than an ingenious anecdote.[3] But it would be wrong to minimize the part played in the outcome, however unconsciously, by Jensen himself.

1 Wilhelm Jensen (1837–1911) was a North German playwright and novelist, respected but not regarded as of very great distinction.

2 The 'Villa Secerno' dream. It is also reported in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 282; but the Pompeii association is not mentioned there.

3 In his *Autobiographical Study* (1925*d*), ibid., **20**, 57, Freud spoke a little contemptuously of *Gradiva* as a work 'which has no particular merit in itself'.

DELUSIONS AND DREAMS IN JENSEN'S *GRADIVA*

I

A group of men who regarded it as a settled fact that the essential riddles [7]
of dreaming have been solved by the efforts of the author of the present work[1] found their curiosity aroused one day by the question of the class of dreams that have never been dreamt at all – dreams created by imaginative writers and ascribed to invented characters in the course of a story. The notion of submitting this class of dreams to an investigation might seem a waste of energy and a strange thing to undertake; but from one point of view it could be considered justifiable. It is far from being generally believed that dreams have a meaning [*etwas Sinnvolles*] and can be interpreted. Science and the majority of educated people smile if they are set the task of interpreting a dream. Only the common people, who cling to superstitions and who on this point are carrying on the convictions of antiquity, continue to insist that dreams can be interpreted. The author of *The Interpretation of Dreams* has ventured, in the face of the reproaches of strict science, to become a partisan of antiquity and superstition. He is, it is true, far from believing that dreams foretell the future, for the unveiling of which men have vainly striven from time immemorial by every forbidden means. But even he has not been able entirely to reject the relation of dreams to the future. For the dream, when the laborious work of translating [*Übersetzungsarbeit*][T] it had been accom- *Übersetzung*
plished, revealed itself to him as a *wish* of the dreamer's represented as *fulfilled*; and who could deny that wishes are predominantly turned towards the future?

I have just said that dreams are fulfilled wishes. Anyone who is not afraid of making his way through an abstruse book, and who does not insist on a complicated problem being represented to him as easy and [8]
simple in order to save him trouble and at the cost of honesty and truth,

1 See Freud, *The Interpretation of Dreams* (1900*a*). [The 'group of men' in question was the Psychological Wednesday Society; see the Editors' Note above, p. 4.]

may find the detailed proof of this thesis in the work I have mentioned. Meanwhile, he may set on one side the objections which will undoubtedly occur to him against equating dreams and wish fulfilments.

But we have gone a long way ahead. It is not a question yet of establishing whether the meaning of a dream can always be rendered by a fulfilled wish, or whether it may not just as often stand for an anxious expectation, an intention, a reflection, and so on. On the contrary, the question that first arises is whether dreams have a meaning at all, whether they ought
Seele to be assessed as mental [*seelischen*]^{T} events. Science answers 'no': it explains dreaming as a purely physiological process, behind which, accordingly, there is no need to look for sense [*Sinn*], meaning [*Bedeutung*] or purpose [*Absicht*]. Somatic stimuli, so it says, play upon the mental instrument during sleep and thus bring to consciousness now one idea [*Vorstellungen*]^{T} and now another, robbed of all mental content: dreams are comparable only to twitchings, not to expressive movements, of the mind.

Now in this dispute as to the estimation in which dreams should be held, imaginative writers [*Dichter*] seem to be on the same side as the ancients, as the superstitious public and as the author of *The Interpretation of Dreams*. For when an author makes the characters constructed by his imagination [*Phantasie*]^{T} dream, he follows the everyday experience that people's thoughts and feelings are continued in sleep and he aims at nothing else than to depict his heroes' states of mind by their dreams. But creative writers [*Dichter*] are valuable allies and their evidence is to be prized highly, for they are apt to know a whole host of things between heaven and earth of which our philosophy has not yet let us dream. In their knowledge of the mind they are far in advance of us everyday people, for they draw upon sources which we have not yet opened up for science. If only this support given by writers in favour of dreams having a meaning were less ambiguous! A strictly critical eye might object that
[9] writers take their stand neither for nor against particular dreams having a psychical meaning; they are content to show how the sleeping mind twitches under the excitations [*Erregungen*]^{T} which have remained active in it as offshoots of waking life.

But even this sobering thought does not dampen our interest in the fashion in which writers make use of dreams. Even if this enquiry should teach us nothing new about the nature of dreams, it may perhaps enable us from this angle to gain some small insight into the nature of creative writing. Real dreams were already regarded as unrestrained and unregulated structures [*Bildungen*]^{T} – and now we are confronted with

unfettered imitations of these dreams! There is far less freedom and arbitrariness in mental life, however, than we are inclined to assume – there may even be none at all. What we call chance in the world outside can, as is well known, be resolved into laws. So, too, what we call arbitrariness in the mind rests upon laws, which we are only now beginning dimly to suspect. Let us, then, see what we find!

There are two methods that we might adopt for this enquiry. One would be to enter deeply into a particular case, into the dream creations of one author [*Dichters*] in one of his works. The other would be to bring together and contrast all the examples that could be found of the use of dreams in the works of different authors. The second method would seem to be far the more effective and perhaps the only justifiable one, for it frees us at once from the difficulties involved in adopting the artificial concept of 'writers' [*'der Dichter'*] as a class. On investigation this class falls apart into individual writers of the most various worth – among them some whom we are accustomed to honour as the deepest observers of the human mind. In spite of this, however, these pages will be devoted to an enquiry of the first sort. It happened that in the group of men among whom the notion first arose there was one[1] who recalled that in the work of fiction that had last caught his fancy there were several dreams which had, as it were, looked at him with familiar faces and invited him to attempt to apply to them the method of *The Interpretation* [10]
of Dreams. He confessed that the subject matter of the little work and the scene in which it was laid may no doubt have played the chief part in creating his enjoyment. For the story was set in the frame of Pompeii and dealt with a young archaeologist who had surrendered his interest in life in exchange for an interest in the remains of classical antiquity and who was now brought back to real life by a roundabout path which was strange but perfectly logical. During the treatment of this genuinely poetic material the reader had been stirred by all kinds of thoughts akin to it and in harmony with it. The work was a short tale by Wilhelm Jensen – *Gradiva* – which its author himself described as a 'Pompeian phantasy'.

And now I ought properly to ask all my readers to put aside this little essay and instead to spend some time in acquainting themselves with *Gradiva* (which first appeared in the bookshops in 1903), so that what I refer to in the following pages may be familiar to them. But for the benefit of those who have already read *Gradiva* I will recall the substance of the story in a brief summary; and I shall count upon their memory to restore to it all the charm of which this treatment will deprive it.

1 [This was Stekel. See the Editors' Note above, p. 4.]

A young archaeologist, Norbert Hanold, had discovered in a museum of antiquities in Rome a relief which had so immensely attracted him that he was greatly pleased at obtaining an excellent plaster cast of it which he could hang in his study in a German university town and gaze at with interest. The sculpture represented a fully grown girl stepping along, with her flowing dress a little pulled up so as to reveal her sandalled feet. One foot rested squarely on the ground; the other, lifted from the ground in the act of following after, touched it only with the tips of the toes, while the sole and heel rose almost perpendicularly.[1] It was probably the unusual and peculiarly charming gait thus presented that attracted the sculptor's notice and that still, after so many centuries, riveted the eyes of its archaeological admirer.

[11] The interest taken by the hero of the story in this relief is the basic psychological fact in the narrative. It was not immediately explicable. 'Dr Norbert Hanold, Lecturer in Archaeology, did not, in fact, find in the relief anything calling for special notice from the point of view of his branch of science.' (3.)[2] 'He could not explain to himself what there was in it that had provoked his attention. He only knew that he had been attracted by something and that the effect had continued unchanged ever since.' But his imagination was occupied with the sculpture without ceasing. He found something 'of today' about it, as though the artist had had a glimpse in the street and captured it 'from life'. He gave the girl thus pictured as she stepped along the name of 'Gradiva' – 'the girl who steps along'.[3] He made up a story that she was no doubt the daughter of an aristocratic family, perhaps 'of a patrician aedile,[4] who carried out his office in the service of Ceres', and that she was on her way to the goddess's temple. Then he found it hard to fit her quiet, calm nature into the busy life of a capital city. He convinced himself, rather, that she must be transported to Pompeii, and that somewhere there she was stepping across the curious stepping-stones which have been dug up and which made it possible to cross dry-foot from one side of the street to the other in rainy weather, though allowing carriage wheels to pass between them as well. Her features struck him as having a *Greek* look and he had no doubt that she was of Hellenic origin. Little by little he brought the whole of his archaeological learning into the service of these and other

1 [See the frontispiece of this volume.]

2 [Plain numbers in brackets in the present translation are page references to Jensen, *Gradiva*, 1903.]

3 [The derivation of the name is further explained below, on p. 39.]

4 [A magistrate in charge of public buildings.]

phantasies [*Phantasien*] relating to the original who had been the model for the relief.

But now he found himself confronted with an ostensibly scientific problem which called for a solution. It was a question of his arriving at a critical judgement as to 'whether Gradiva's gait as she stepped along had been reproduced by the sculptor in a life-like manner'. He found that he [12] himself was not capable of imitating it, and in his quest for the 'reality' of this gait he was led 'to make observations of his own from life in order to clear the matter up'. (9.) This, however, forced him into a course of behaviour that was quite foreign to him. 'Hitherto, the female sex [*Geschlecht*][T] had been to him no more than the concept of something made of marble or bronze, and he had never paid the slightest attention to its contemporary representatives.' Social duties had always seemed to him an unavoidable nuisance; he saw and heard young ladies whom he came across in society so little that when he next met them he would pass them by without a sign; and this, of course, made no favourable impression on them. Now, however, the scientific task which he had taken on compelled him, in dry, but more especially in wet, weather, to look eagerly in the street at women's and girls' feet as they came into view – an activity which brought him some angry, and some encouraging, glances from those who came under his observation; 'but he was aware of neither the one nor the other'. (10.) As an outcome of these careful studies he was forced to the conclusion that Gradiva's gait was not discoverable in reality; and this filled him with regret and vexation.

Soon afterwards he had a terrifying dream, in which he found himself in ancient Pompeii on the day of the eruption of Vesuvius and witnessed the city's destruction. 'As he was standing at the edge of the forum beside the Temple of Jupiter, he suddenly saw Gradiva at no great distance from him. Till then he had had no thought of her presence, but now it occurred to him all at once and as though it was something natural that, since she was a Pompeian, she was living in her native town, and, *without his having suspected it, living as his contemporary*.' (12.) Fear of the fate that lay before her provoked him to utter a warning cry, whereupon the figure, as she calmly stepped along, turned her face towards him. But she then proceeded on her way untroubled, till she reached the portico of the temple;[1] there she took her seat on one of the steps and slowly laid [13] her head down on it, while her face grew paler and paler, as though it were turning into marble. When he hurried after her, he found her

1 [The Temple of Apollo.]

stretched out on the broad step with a peaceful expression, like someone asleep, till the rain of ashes buried her form.

When he awoke, the confused shouts of the inhabitants of Pompeii calling for help still seemed to echo in his ears, and the dull muttering of the breakers in the agitated sea. But even after his returning reflection recognized the sounds as the awakening signs of noisy life in a great city, he retained his belief for a long time in the reality of what he had dreamt. When at length he had freed himself of the notion that he himself had been present at the destruction of Pompeii almost two thousand years earlier, he was nevertheless left with what seemed a true conviction that Gradiva had lived in Pompeii and been buried there with the others in the year 79 A.D. The dream had as its result that now for the first time in his phantasies about Gradiva he mourned for her as someone who was lost.

While he was leaning out of the window, absorbed in these thoughts, his attention was caught by a canary warbling its song from a cage in the open window of the house opposite. Suddenly something passed with a start through the mind of the young man, who seems not yet to have fully woken from his dream. He thought he saw in the street a form like his Gradiva, and thought he even recognized her characteristic gait. Without thinking, he hurried into the street so as to catch up with her; and it was only the laughter and jeers of the passers-by at his early-morning attire that quickly drove him back into his house. When he was in his room again, the singing of the canary in its cage once more caught his attention and suggested a comparison with himself. He too, so it seemed to him, was like someone sitting in a cage, though it was easier for him to escape from it. As though as a further aftermath of his dream, and perhaps, too, under the influence of the mild air of spring, a resolve took
[14] shape in him to make a springtime journey to Italy. A scientific excuse for it soon presented itself, even though 'the impulse to make this journey had arisen from a feeling he could not name'. (24.)

Let us pause for a moment at this journey, planned for such remarkably uncogent reasons, and take a closer look at our hero's personality and behaviour. He still appears to us as incomprehensible and foolish; we have no idea how his peculiar folly will be linked to human feeling and so arouse our sympathy. It is an author's privilege to be allowed to leave us in such uncertainty. The charm of his language and the ingenuity of his ideas offer us a provisional reward for the reliance we place in him and for the still unearned sympathy which we are ready to feel for his hero.

Of this hero we are further told that he was preordained by family tradition to become an archaeologist, that in his later isolation and independence he was wholly absorbed in his studies and had turned completely away from life and its pleasures. Marble and bronze alone were truly alive for him; they alone expressed the purpose and value of human life. But nature, perhaps with benevolent intent, had infused into his blood a corrective of an entirely unscientific sort – an extremely lively imagination, which could show itself not only in his dreams but often in his waking life as well. This division between imagination and intellect destined him to become an artist or a neurotic; he was one of those whose kingdom is not of this world. Thus it was that it could come about that his interest was attached to a relief representing a girl stepping along in a peculiar fashion, that he wove his phantasies around her, imagined a name and origin for her, placed the figure he had created in the setting of the Pompeii that was buried more than eighteen hundred years before, and finally, after a strange anxiety dream [*Angsttraum*]T, magnified his phantasy of the existence and death of this girl named Gradiva into a delusion [*Wahn*], which gained an influence over his actions. Such products of the imagination would seem to us astonishing and inexplicable if we met them in someone in real life. Since our hero, Norbert Hanold, is a fictitious person, we may perhaps put a timid question to his author, and ask whether his imagination was determined by forces [*Mächten*]T other than its own arbitrary choice.

Angst

[15]

We had left our hero at the moment when he was apparently being led by the song of a canary to decide on a journey to Italy, the purpose [*Motiv*]T of which was evidently not clear to him. We learn further that he had no fixed plan or goal for his journey. An inner restlessness and dissatisfaction drove him from Rome to Naples and from thence further still. He found himself among the swarm of honeymooners and was forced to notice the loving couples of 'Edwins' and 'Angelinas',[1] but was quite unable to understand their goings on. He came to the conclusion that of all the follies of mankind 'getting married takes first place, as the greatest and most incomprehensible, and the senseless honeymoon trips to Italy are, in a way, the crowning touch of this idiocy'. (27.) Having been disturbed in his sleep by the proximity of a loving couple in Rome, he hurriedly fled to Naples, only to find other 'Edwins' and 'Angelinas'

1 ['August' and 'Grete' in the original. The names recur frequently in the course of the story and it has seemed best to replace them with those conventionally applied to English honeymoon couples of the late Victorian age.]

there. Having gathered from their conversation that the majority of these pairs of birds had no intention of nesting among the ruins of Pompeii, but were flying towards Capri, he determined to do what they did not, and only a few days after his departure found himself 'contrary to his expectation and intentions' in Pompeii.

But without finding there the repose he was in search of. The part which had so far been played by the honeymoon couples, who had troubled his spirits and harassed his thoughts, was now taken over by the house-flies, which he was inclined to regard as the incarnation of all that is absolutely evil and unnecessary. The two sorts of tormenting spirits
[16] melted into a unity: some of the pairs of flies reminded him of the honeymooners, and he suspected that they too were addressing each other in their language as 'dearest Edwin' and 'darling Angelina'. Eventually, he could not but realize that 'his dissatisfaction was not caused only by his surroundings but that its source was in part derived from within himself'. (42.) He felt that 'he was discontented because he lacked something, though it was not clear to him what'.

Next morning he passed through the '*Ingresso*' into Pompeii, and, after getting rid of the guide, strolled aimlessly through the town, without, strangely enough, remembering that only a short time before he had been present in his dream at its burial. When later on, at the 'hot and holy'[1] midday hour, which the ancients regarded as the hour of ghosts, the other visitors had taken flight and the heaps of ruins lay before him desolate and bathed in sunlight, he found that he was able to carry himself back into the life that had been buried – but not by the help of science. 'What it taught was a lifeless, archaeological way of looking at things, and what came from its mouth was a dead, philological language. These were of no help to an understanding through the spirit, the feelings, the heart – put it as you please. Whoever had a longing for that must stand here alone, the only living creature, in the hot silence of midday, among the relics of the past, and look, but not with bodily eyes, and listen, but not with physical ears. And then . . . the dead wakened and Pompeii began to live once more.' (55.)

While he was thus animating the past with his imagination, he suddenly saw the unmistakable Gradiva of his relief come out of a house and step trippingly over the lava stepping-stones to the other side of the street, just as he had seen her do in his dream the other night, when she had lain down as though to sleep, on the steps of the Temple of Apollo. 'And together with his memory something else came into his

1 [*Gradiva*, 51.]

consciousness for the first time: without being aware himself of the impulse within him, he had come to Italy and had travelled on to Pompeii, [17] without stopping in Rome or Naples, in order to see whether he could find any traces of her. And "traces" literally; for with her peculiar gait she must have left behind an imprint of her toes in the ashes distinct from all the rest.' (58.)

At this point the tension in which the author has hitherto held us grows for a moment into a painful sense of bewilderment. It is not only our hero who has evidently lost his balance; we too have lost our bearings in the face of the apparition of Gradiva, who was first a marble figure and then an imaginary one. Is she a hallucination of our hero, led astray by his delusions? Is she a 'real' ghost? or a living person? Not that we need believe in ghosts when we draw up this list. The author, who has called his story a 'phantasy', has found no occasion so far for informing us whether he intends to leave us in our world, decried for being prosaic and governed by the laws of science, or whether he wishes to transport us into another and imaginary world, in which spirits and ghosts are given reality. As we know from the examples of *Hamlet* and *Macbeth*, we are prepared to follow him there without hesitation. If so, the imaginative archaeologist's delusion would have to be measured by another standard. Indeed, when we consider how improbable it must be that a real person could exist who bore an exact resemblance to the antique sculpture, our list of alternatives shrinks to two: a hallucination or a midday ghost. A small detail in the account soon cancels the first possibility. A large lizard was lying motionless, stretched out in the sunshine, but fled at the approach of Gradiva's foot and darted away across the lava paving-stones. So it was no hallucination, but something outside our dreamer's mind. But could the reality of a *rediviva* startle a lizard?

Gradiva disappeared in front of the House of Meleager. We shall not be surprised to hear that Norbert Hanold pursued his delusion that Pompeii had come to life around him at the midday hour of ghosts and [18] supposed that Gradiva too had come to life again and had entered the house in which she had lived before the fatal August day in 79 A.D. Ingenious speculations upon the personality of its owner (after whom the house was probably named), and upon Gradiva's relationship to him, shot through his head, and proved that his science was now completely in the service of his imagination. He entered the house, and suddenly found the apparition once more, sitting on some low steps between two

yellow columns. 'There was something white stretched out across her knees; he could not clearly discern what it was; it seemed to be a sheet of papyrus . . .' On the basis of his latest theories of her origin he addressed her in Greek, and waited with trepidation to learn whether, in her phantom presence, she possessed the power of speech. Since she made no reply, he addressed her instead in Latin. Then, with a smile on her lips: 'If you want to speak to me', she said, 'you must do it in German.'

What a humiliation for us readers! So the author has been making fun of us, and, with the help, as it were, of a reflection of the Pompeian sunshine, has inveigled *us* into a delusion on a small scale, so that we may be forced to pass a milder judgement on the poor wretch on whom the midday sun was really shining. Now, however, that we have been cured of our brief confusion, we know that Gradiva was a German girl of flesh and blood – a solution which we were inclined to reject as the most improbable one. And now, with a quiet sense of superiority, we may wait to learn what the relation was between the girl and her marble image, and how our young archaeologist arrived at the phantasies which pointed towards her real personality.

But our hero was not torn from his delusion as quickly as we have been, for, as the author tells us, 'though his belief made him happy, he had to take the acceptance of quite a considerable number of mysteries into the
[19] bargain'. (140.) Moreover, this delusion probably had internal roots in him of which we know nothing and which do not exist in ourselves. In his case, no doubt, energetic treatment would seem necessary before he could be brought back to reality. Meanwhile all he could do was to fit his delusion into the wonderful experience he had just had. Gradiva, who had perished with the rest in the destruction of Pompeii, could be nothing other than a midday ghost who had returned to life for the brief ghostly hour. But why was it that, after hearing her reply delivered in German, he exclaimed, 'I knew your voice sounded like that'? Not only we, but the girl herself was bound to ask the question, and Hanold had to admit that he had never heard it, though he had expected to in his dream, when he called to her as she lay down to sleep on the temple steps. He begged her to do the same thing again as she had then; but now she rose, gave him a strange look, and in a few paces disappeared between the columns of the court. A pretty butterfly had shortly before fluttered round her for a while; and he interpreted it as a messenger from Hades reminding the dead girl that she must return, since the midday hour of

ghosts was at an end. Hanold still had time to call after the girl as she vanished: 'Will you return here tomorrow at the midday hour?' To us, however, who can now venture upon more sober interpretations, it looks as though the young lady had seen something improper in the remark addressed to her by Hanold and had left him with a sense of having been insulted; for after all she could have known nothing of his dream. May not her sensibility have detected the erotic nature of his request, whose motive in Hanold's eyes lay in its relation to his dream?

After Gradiva's disappearance our hero had a careful look at all the guests congregated for their midday meal at the Hotel Diomède and went on to do the same at the Hotel Suisse, and he was then able to feel assured that in neither of the only two hotels known to him in Pompeii was there anyone bearing the remotest resemblance to Gradiva. He would of course have rejected as nonsensical the idea that he might [20] actually meet Gradiva in one of the two inns. And presently the wine pressed from the hot soil of Vesuvius helped to intensify the whirl of feeling in which he spent the day.

For the following day one thing only was fixed: that Hanold must once more be in the House of Meleager at midday; and, in expectation of that moment, he made his way into Pompeii by an irregular route – over the ancient city wall. A sprig of asphodel, hung about with its white bell-shaped blossoms, seemed to him significant enough, as the flower of the underworld, for him to pluck it and carry it with him. But as he waited, the whole science of archaeology seemed to him the most pointless and indifferent thing in the world, for another interest had taken possession of him: the problem of 'what could be the nature of the bodily apparition of a being like Gradiva, who was at once dead and, even though only at the midday hour, alive'. (80.) He was fearful, too, that he might not meet her that day, for perhaps her return could be permitted only at long intervals; and when he perceived her once again between the columns, he thought her apparition was only a trick of his imagination, and in his pain exclaimed: 'Oh! if only you still existed and lived!' This time, however, he had evidently been too critical, for the apparition possessed a voice, which asked him if he was meaning to bring her the white flower, and engaged him, disconcerted once again, in a long conversation.

To his readers, however, to whom Gradiva has already grown of interest as a living person, the author explains that the displeased and repelling look which she had given him the day before had yielded to an expression of searching interest and curiosity. And indeed she now proceeded to question him, asked for an explanation of his remark on the

previous day and enquired when it was that he had stood beside her as she lay down to sleep. In this way she learnt of his dream, in which she had perished along with her native city, and then of the marble relief and the posture of the foot which had so much attracted the archaeologist.
[21] And now she showed herself ready to demonstrate her gait, and this proved that the only divergence from the original portrait of Gradiva was that her sandals were replaced by light sand-coloured shoes of fine leather – which she explained as being an adaptation to the present day. She was evidently entering into his delusion, the whole compass of which she elicited from him, without ever contradicting it. Only once did she seem to be distracted from the part she was playing, by an emotion of her own; and this was when, with his thoughts on the relief, he declared that he had recognized her at the first glance. Since at this stage of their conversation she still knew nothing about the relief, it was natural for her to misunderstand Hanold's words; but she quickly recovered herself, and it is only to us that some of her remarks sound as though they had a double sense, as though besides their meaning in the context of the delusion they also meant something real and present day – for instance, when she regretted that he had not succeeded in confirming the Gradiva gait in his experiments in the streets: 'What a pity! perhaps you would not have had to make the long journey here!' (89.) She also learnt that he had given her portrait on the relief the name of 'Gradiva', and told him her real name, 'Zoe'. 'The name suits you beautifully, but it sounds to me like a bitter mockery, for Zoe means life.' 'One must bow to the inevitable', was her reply, 'and I have long grown used to being dead.' Promising to be at the same place again at the midday hour next day, she bade him farewell after once more asking him for the sprig of asphodel: 'to those who are more fortunate people give roses in the spring; but to me it is right that you should give the flower of forgetfulness.' (90.) No doubt melancholy suited someone who had been so long dead and had returned to life again for a few short hours.

We are beginning to understand now, and to feel some hope. If the young lady in whose form Gradiva had come to life again accepted Hanold's delusion so fully, she was probably doing so in order to set him
[22] free from it. There was no other way of doing so; to contradict it would have put an end to any such possibility. Even the serious treatment of a real case of illness of the kind could proceed in no other way than to begin by taking up the same ground as the delusional structure and then investigating it as completely as possible. If Zoe was the right person for

the job, we shall soon learn, no doubt, how to cure a delusion like our hero's. We should also be glad to know how such delusions arise. It would be a strange coincidence – but, nevertheless, not without an example or parallel – if the treatment of the delusion were to coincide with its investigation and if the explanation of its origin were to be revealed precisely while it was being dissected. We may suspect, of course, that, if so, our case of illness might end up as a 'commonplace' love story. But the healing power of love against a delusion is not to be despised – and was not our hero's infatuation for his Gradiva sculpture a complete instance of being in love, though of being in love with something past and lifeless?

After Gradiva's disappearance, there was only a distant sound, like the laughing call of a bird flying over the ruined city. The young man, now by himself, picked up a white object that had been left behind by Gradiva: not a sheet of papyrus, but a sketch-book with pencil drawings of various scenes in Pompeii. We should be inclined to regard her having forgotten the book there as a pledge of her return, for it is our belief that no-one forgets anything without some secret reason [*Grund*] or hidden motive [*Motiv*].

The remainder of the day brought Hanold all manner of strange discoveries and confirmations, which he failed to synthesize into a whole. He perceived today in the wall of the portico where Gradiva had vanished a narrow gap, which was wide enough, however, to allow someone unusually slim to pass through it. He recognized that Zoe-Gradiva need not have sunk into the earth here – an idea which now seemed to him so unreasonable that he felt ashamed of having once believed in it; she might well have used the gap as a way of reaching her [23]
grave. A slight shadow seemed to him to melt away at the end of the Street of the Tombs in front of what is known as the Villa of Diomedes.

In the same whirl of feeling as on the previous day, and deep in the same problems, he now strolled round the environs of Pompeii. What, he wondered, might be the bodily nature of Zoe-Gradiva? Would one feel anything if one touched her hand? A strange urge drove him to a determination to put this experiment to the test. Yet an equally strong reluctance held him back even from the very idea.

On a sun-bathed slope he met an elderly gentleman who, from his accoutrements, must be a zoologist or botanist and who seemed to be engaged in a hunt. This individual turned towards him and said: 'Are you interested in *faraglionensis* as well? I should hardly have suspected

it, but it seems to be quite probable that it occurs not only on the Faraglioni Islands off Capri, but has established itself on the mainland too. The method prescribed by our colleague Eimer[1] is a really good one; I have made use of it many times already with excellent results. Please keep quite still . . .' (96.) Here the speaker broke off and placed a snare made of a long blade of grass in front of a crack in the rocks out of which the small iridescent blue head of a lizard was peering. Hanold left the lizard-hunter with a critical feeling [*Idee*] that it was scarcely credible what foolish and strange purposes could lead people to make the long journey to Pompeii – without, needless to say, including in his criticism himself and his intention of searching in the ashes of Pompeii for Gradiva's footprints. Moreover, the gentleman's face seemed familiar, as though he had had a glimpse of it in one of the two hotels; his manner of address, too, had been as though he were speaking to an acquaintance.

In the course of his further walk, he arrived by a side-road at a house which he had not yet discovered and which turned out to be a third hotel,
[24] the 'Albergo del Sole'.[2] The landlord, with nothing else to do, took the opportunity of showing off his house and the excavated treasures it contained to their best advantage. He asserted that he had been present when the pair of young lovers had been found in the neighbourhood of the Forum, who, in the knowledge of their inevitable doom, had awaited death closely embraced in each other's arms. Hanold had heard of this before, and had shrugged his shoulders over it as a fabulous tale invented by some imaginative story-teller; but today the landlord's words aroused his belief and this was increased when a metal clasp was produced, covered with a green patina, which was said to have been retrieved from the ashes beside the girl's remains. He purchased this clasp without any further critical doubts, and when, as he left the *albergo*, he saw in an open window a nodding sprig of asphodel covered with white blossoms, the sight of the funeral flowers came over him as a confirmation of the genuineness of his new possession.

But with the clasp a new delusion took possession of him, or rather the old one had a small piece added to it – no very good augury, it would seem, for the treatment that had been begun. A pair of young lovers in an embrace had been dug out not far from the Forum, and it was in that very neighbourhood, by the Temple of Apollo, that in his dream he had seen Gradiva lie down to sleep [p. 9 f. above]. Was it not possible that in fact she had gone further along from the Forum and had met someone

1 [A well-known zoologist of the second half of the nineteenth century.]

2 [The 'Hotel of the Sun'.]

and that they had then died together? A tormenting feeling, which we might perhaps liken to jealousy, arose out of this suspicion. He appeased it by reflecting on the uncertainty of the construction, and brought himself to his senses far enough to be able to take his evening meal at the Hotel Diomède. There his attention was drawn by two newly arrived visitors, a He and a She, whom he was obliged to regard as a brother and sister on account of a certain resemblance between them – in spite of the difference in the colour of their hair. They were the first people he had met on his journey who made a positive [*sympathischen*] impression on him. A red Sorrento rose worn by the girl aroused some kind of memory [25]
in him, but he could not think what. At last he went to bed and had a dream. It was a remarkably senseless affair, but was obviously hashed up from his day's experiences. 'Somewhere in the sun Gradiva was sitting, making a snare out of a blade of grass to catch a lizard in, and said: "Please keep quite still. Our lady colleague is right; the method is a really good one and she has made use of it with excellent results."' He fended off this dream while he was still asleep, with the critical thought that it was utter madness, and he succeeded in freeing himself from it with the help of an invisible bird which uttered a short laughing call and carried off the lizard in its beak.

In spite of all this turmoil, he woke up in a rather clearer and steadier frame of mind. A branch of a rose-tree bearing flowers of the sort he had seen the day before on the young lady's breast reminded him that during the night someone had said that people give roses in the spring. Without thinking, he picked a few of the roses, and there must have been something connected with them that had a relaxing effect on his mind. He felt relieved of his unsociable feelings, and went by the usual way to Pompeii, burdened with the roses, the metal clasp and the sketch-book, and occupied with a number of problems concerning Gradiva. The old delusion had begun to show cracks: he was beginning to wonder whether she might be in Pompeii, not at the midday hour only, but at other times as well. The stress had shifted [*verschoben*], however, to the latest addition, and the jealousy attaching to it tormented him in all sorts of disguises. He could almost have wished that the apparition might remain visible to his eyes alone, and elude the perception of others: then, in spite of everything, he could look on her as his own exclusive property. While he was strolling about, waiting for the midday hour, he had an unexpected encounter. In the *Casa del Fauno* he came upon two figures in a corner in which they must have thought themselves out of sight, for they were embraced in each other's arms and their lips were pressed together.

[26] He was astonished to recognize in them the attractive [*sympathische*] couple from the previous evening. But their behaviour now did not seem to fit a brother and sister: their embrace and their kiss seemed to him to last too long. So after all they were a pair of lovers, presumably a young honeymoon couple – yet another Edwin and Angelina. Curiously enough, however, this time the sight of them caused him only satisfaction; and with a sense of awe, as though he had interrupted some secret act of devotion, he withdrew unobserved. An attitude of respectfulness, which he had long been without, had returned to him.

When he reached the House of Meleager, he was once more overcome by such a violent dread of finding Gradiva in someone else's company that when she appeared the only words he found to greet her with were: 'Are you alone?' It was with difficulty that he allowed her to bring him to realize that he had picked the roses for her. He confessed his latest delusion to her – that she was the girl who had been found in the Forum in a lover's embrace and who had owned the green clasp. She enquired, not without a touch of mockery, whether he had found the thing in the sun perhaps: the sun (and she used the [Italian] word '*sole*') produced all kinds of things like that. He admitted that he was feeling dizzy in his head, and she suggested as a cure that he should share her small picnic meal with her. She offered him half of a roll wrapped up in tissue paper and ate the other half herself with an obviously good appetite. At the same time her perfect teeth flashed between her lips and made a slight crunching sound as they bit through the crust. 'I feel as though we had shared a meal like this once before, two thousand years ago', she said; 'can't you remember?' (118.) He could think of no reply, but the improvement in his head brought about by the food, and the many indications she gave of her actual presence, were not without their effect on him. Reason began to rise in him and to throw doubt on the whole delusion of Gradiva's being no more than a midday ghost – though no doubt it might be argued on the other hand that she herself had just said that she had
[27] shared a meal with him two thousand years ago. As a means of settling the conflict an experiment suggested itself: and this he carried out craftily and with regained courage. Her left hand, with its delicate fingers, was resting on her knees, and one of the house-flies whose impertinence and uselessness had so much roused his indignation alighted on it. Suddenly Hanold's hand was raised in the air and descended with a vigorous slap on the fly and Gradiva's hand.

This bold experiment had two results: first, a joyful conviction that he had without any doubt touched a real, living, warm human hand, but

afterwards a reproof that made him jump up in a fright from his seat on the steps. For, from Gradiva's lips, when she had recovered from her astonishment, there rang out these words: 'There's no doubt you're out of your mind, Norbert Hanold!' As everyone knows, the best method of waking a sleeper or a sleep-walker is to call him by his own name. But unluckily there was no chance of observing the effects produced on Norbert Hanold by Gradiva's calling him by his name (which he had told no-one in Pompeii). For at this critical moment the attractive pair of lovers from the *Casa del Fauno* appeared, and the young lady exclaimed in a tone of joyful surprise: 'Zoe! Are you here too? And on your honeymoon like us? You never wrote me a word about it!' In face of this new evidence of Gradiva's living reality, Hanold took flight.

Nor was Zoe-Gradiva very agreeably surprised by this unexpected visit, which interrupted her in what was apparently an important task. But she quickly pulled herself together and made a fluent reply to the question, in which she explained the situation to her friend – and even more to us – and which enabled her to get rid of the young couple. She congratulated them; but she was not on her honeymoon. 'The young man who's just gone off is labouring, like you, under a remarkable aberration. He seems to think there's a fly buzzing in his head. Well, I expect everyone has some sort of insect there. It's my duty to know something about entomology, so I can help a little in cases like that. My father and I [28]
are staying at the Sole. Something got into *his* head too, and the brilliant idea occurred to him besides of bringing me here with him on condition that I amused myself on my own at Pompeii and made no demands of any kind on him. I told myself I should dig out something interesting here even by myself. Of course, I hadn't counted on making the find that I have – I mean my luck in meeting you, Gisa.' (124.) But now, she added, she must hurry off, so as to be company for her father at his lunch in the 'Sun'. And she departed, after having introduced herself to us as the daughter of the zoologist and lizard-catcher and after having, by all kinds of ambiguous remarks, admitted her therapeutic intention and other secret designs as well.

The direction she took, however, was not towards the Hotel of the Sun, where her father was waiting for her. But it seemed to her too as though a shadowy form was seeking its grave near the Villa of Diomedes, and was vanishing beneath one of the monuments. And for that reason she directed her steps towards the Street of the Tombs, with her foot lifted almost perpendicularly at each step. It was to this same place that Hanold had fled in his shame and confusion. He wandered

ceaselessly up and down in the portico of the garden, engaged in the task of disposing of the remains of his problem by an intellectual effort. One thing had become undeniably clear to him: that he had been totally without sense [*Sinn*] and reason [*Verstand*] in believing that he had been associating with a young Pompeian woman who had come to life again in a more or less physical shape. It could not be disputed that this clear insight into his delusion was an essential step forward on his road back to a sound understanding. But, on the other hand, this living woman, with whom other people communicated as though she were as physically real as themselves, was Gradiva, and she knew his name; and his scarcely awakened reason was not strong enough to solve this riddle. He was hardly calm enough emotionally, either, to show himself capable of facing so hard a task, for he would have preferred to have been buried along
[29] with the rest two thousand years before in the Villa of Diomedes, so as to be quite certain of not meeting Zoe-Gradiva again.

Nevertheless, a violent desire to see her again struggled against what was left of the inclination to flight still lingering in him.

As he turned one of the four corners of the colonnade, he suddenly recoiled. On a broken fragment of masonry was sitting one of the girls who had perished here in the Villa of Diomedes. This, however, was a last attempt, quickly rejected, at taking flight into the realm of delusion. No, it was Gradiva, who had evidently come to give him the final portion of her treatment. She quite correctly interpreted his first instinctive
Instinkt [*instinktive*][T] movement as an attempt to leave the building, and showed him that it was impossible for him to run away, for a terrific downpour of rain had begun outside. She was ruthless, and began her examination by asking him what he had been trying to do with the fly on her hand. He had not the courage to make use of a particular pronoun,[1] but he did have the courage for something more important – for asking her the decisive question:

'As someone said, I was rather confused in my head, and I must apologize for treating the hand . . . I can't understand how I could be so senseless . . . but I can't understand either how its owner could point out my . . . my unreasonableness to me by my own name.' (134.)

1 [The pronoun of the second person singular. The point of some of what follows is necessarily lost in English. In all his remarks to Gradiva hitherto, Hanold had used the second person singular, partly, no doubt, because that would be the classical usage. Now, however, that he was beginning to realize that he was talking to a modern German girl, he felt that the second person singular was far too familiar and affectionate. Gradiva, on the other hand, has used the second person singular throughout in speaking to him.]

'So your understanding has not got as far as that, Norbert Hanold. But I can't say I'm surprised at it, you've accustomed me to it so long. I needn't have come to Pompeii to discover it again, and you could have confirmed it a good hundred miles nearer home.

'A hundred miles nearer', she explained, as he still failed to understand, 'diagonally across the street from where you live – in the house at the corner. There's a cage in my window with a canary in it.' [30]

These last words, as he heard them, affected him like a distant memory: that must have been the same bird whose song had given him the idea of his journey to Italy.

'My father lives in that house: the Professor of Zoology, Richard Bertgang.'

So, since she was his neighbour, she knew him by sight and by name. We feel a sense of disillusionment: the solution falls flat and seems unworthy of our expectations.

Norbert Hanold showed that he had not yet regained his independence of thought when he replied: 'So you[1] . . . you are Fräulein Zoe Bertgang? But she looked quite different . . .'

Fräulein Bertgang's answer shows us that all the same there had been other relations between the two of them besides their simply being neighbours. She could argue in favour of the familiar '*du*', which he had used naturally to the midday ghost but had drawn back from in speaking to the live girl, but on behalf of which she claimed ancient rights: 'If you find this formal mode of address more suitable, I can use it too. But I find the other comes to my lips more naturally. I don't know if I looked different in the early days when we used to run about together in a friendly way or sometimes, by way of a change, used to bump and thump each other. But if you[2] had even once looked at me attentively in recent years, it might have dawned on you that I've looked like this for quite a time.'

So there had been a childhood friendship between them – perhaps a childhood love – which justified the '*du*'. This solution, it may be, falls just as flat as the one we first suspected. We are brought to a much deeper level, however, when we realize that this childhood relationship unexpectedly explains a number of details in what had happened in their [31]

1 ['*Sie*', the German pronoun of the third person plural, which is always used in formal speech instead of the '*du*' of the second person singular.]

2 [From this point to the middle of her next speech, when, as will be seen, she finally rebels, Zoe makes a valiant attempt to use the formal '*Sie*'.]

contemporary contact. Consider, for instance, the slapping of Zoe-Gradiva's hand. Norbert Hanold found a most convincing reason for it in the necessity for reaching an experimental answer to the problem of the apparition's physical reality. But was it not at the same time remarkably like a revival of the impulse for the 'bumping and thumping' whose dominance in their childhood was shown by Zoe's words? And think, again, of how Gradiva asked the archaeologist whether it did not seem to him that they had shared a meal like this two thousand years before. This unintelligible question suddenly seems to have a sense, if we once more replace the historical past with the personal one – childhood – of which the girl still had lively memories but which the young man appeared to have forgotten. And now the discovery dawns upon us that the young archaeologist's phantasies about his Gradiva may have been an echo of his forgotten childhood memories. If so, they were not capricious products of his imagination, but determined, without his knowing it, by the store of childhood impressions which he had forgotten, but which were still at work in him. It should be possible for us to show the origin of the phantasies in detail, even though we can only guess at them. He imagined, for instance, that Gradiva must be of *Greek* origin and that she was the daughter of a respected personage – a priest of Ceres, perhaps. This seems to fit in pretty well with his knowing that she bore the Greek name of Zoe and that she belonged to the family of a Professor of Zoology. But if Hanold's phantasies were transformed memories, we may expect to find an indication of the source of those phantasies in the information given us by Zoe Bertgang. Let us listen to what she has to say. She has told us of their intimate friendship in their childhood, and we shall now hear of the further course taken by this childhood relationship.

[32]

'At that time, as a matter of fact, up to about the age when, I don't know why, people begin to call us "*Backfisch*",[1] I had got accustomed to being remarkably dependent on you and believed I could never in the world find a more agreeable friend. I had no mother or sister or brother, my father found a slow-worm in spirits considerably more interesting than me; and everyone (and I include girls) must have *something* to occupy their thoughts and whatever goes along with them. That was what you were then. But when archaeology took hold of you I discovered – you must forgive me, but really your polite innovation sounds to me *too* ridiculous and, besides, it doesn't fit in with what I want to express – as I

1 [Literally 'fish for frying'. The common German slang term equivalent to 'flapper' or 'teenager'.]

was saying, it turned out that you'd[1] become an unbearable person who (at any rate so far as I was concerned) no longer had any eyes in his head or tongue in his mouth, or any memory, where my memory had stuck, of our friendship when we were children. No doubt that was why I looked different from before. For when from time to time I met you in society – it happened once as recently as last winter – you didn't see me, still less did I hear you say a word. Not that there was any distinction for me in that, for you treated everyone else alike. I was thin air for you, and you – with your tuft of fair hair that I'd rumpled for you often enough in the past – you were as dull, as dried up and as tongue-tied as a stuffed cockatoo, and at the same time as grandiose as an – *Archaeopteryx* – yes, that's right, that's what they call the antediluvian bird monstrosity they've dug up. Only there was one thing I hadn't suspected: that there was an equally grandiose phantasy lodged in your head of looking on me too, here in Pompeii, as something that had been dug up and come to life again. And when all at once there you were standing in front of me quite [33]
unexpectedly, it took me quite a lot of trouble at first to make out what an incredible cobweb your imagination had spun in your brain. After that, it amused me and quite pleased me in spite of its lunacy. For, as I told you, I hadn't suspected it of you.'

Thus she tells us plainly enough what with the years had become of their childhood friendship. In her it grew until she was thoroughly in love, for a girl must have something to which she can give her heart. Fräulein Zoe, the embodiment of cleverness and clarity, makes her own mind quite transparent to us. While it is in any case the general rule for a normally constituted girl to turn her affection towards her father in the first instance, Zoe, who had no-one in her family but her father, was especially ready to do so. But her father had nothing left over for her; all his interest was engrossed by the objects of his science. So she was obliged to cast her eyes around upon other people, and became especially attached to her young playmate. When he too ceased to have any eyes for her, her love was not shaken by it but rather increased, for he had become like her father, was, like him, absorbed by science and held apart by it from life and from Zoe. Thus it was made possible for her to remain faithful in her unfaithfulness – to find her father once more in her loved one, to include both of them with the same emotion, or, as we may say, to identify both of them in her feeling. What is our justification for this piece of psychological analysis, which might well seem arbitrary? The author has

1 [From this point onwards she finally reverts to '*du*'.]

presented us with it in a single, but highly characteristic, detail. When Zoe described the transformation in her former playmate which had so greatly disturbed her, she abused him by comparing him to an Archaeopteryx, the bird-like monstrosity which belongs to the archaeology of zoology. In that way she found a single concrete expression of the identity of the two figures. Her complaint applies with the same word to the
[34] man she loved and to her father. The Archaeopteryx is, we might say, a compromise idea or an intermediate idea[I] in which her thought about the folly of the man she loved coincided with the analogous thought about her father.

With the young man, things had taken a different turn. Archaeology took hold of him and left him with an interest only in women of marble and bronze. His childhood friendship, instead of being strengthened into a passion, was dissolved, and his memories of it passed into such profound forgetfulness that he did not recognize or notice his early playmate when he met her in society. It is true that when we look further we may doubt whether 'forgetfulness' is the correct psychological description of the fate of these memories in our young archaeologist. There is a kind of forgetting which is distinguished by the difficulty with which the memory is awakened even by a powerful external summons, as though some internal resistance were struggling against its revival. A forgetting of this kind has been given the name of 'repression' [*'Verdrängung'*][T] in psychopathology; and the case which our author has put before us seems to be an example of this repression. Now we do not know in general whether the forgetting of an impression is linked with the dissolution of its memory trace in the mind; but we can assert quite definitely of 'repression' that it does not coincide with the dissolution or extinction of the memory. What is repressed cannot, it is true, as a rule make its way into memory without more ado; but it retains a capacity for effective action, and, under the influence of some external event, it may one day bring about psychical consequences which can be regarded as products of a modification of the forgotten memory and as derivatives of it and which remain unintelligible unless we take this view of them. We have already seemed to recognize in Norbert Hanold's phantasies about Gradiva derivatives of his repressed memories of his childhood friend-
[35] ship with Zoe Bertgang. A return like this of what has been repressed is to be expected with particular regularity when a person's erotic feelings

1 [Ideas of this kind play an important part in dreams and, indeed, wherever the primary psychical process is dominant. See *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 533. Some good examples are given in Chapter IV of *On Dreams* (1901*a*), ibid., **5**, 586 ff.]

are attached to the repressed impressions – when his erotic life has been attacked by repression. In such cases the old Latin saying holds true, though it may have been coined first to apply to expulsion by external influences and not to internal conflicts: 'Naturam expelles furca, tamen usque recurret.'[1] But it does not tell us everything. It only informs us of the *fact* of the return of the piece of nature that has been repressed; it does not describe the highly remarkable *manner* of that return, which is accomplished by what seems like a piece of malicious treachery. It is precisely what was chosen as the instrument of repression – like the '*furca*' of the Latin saying – that becomes the vehicle [*Träger*] for the return: in and behind the repressing force, what is repressed proves itself victor in the end. This fact, which has been so little noticed and deserves so much consideration, is illustrated – more impressively than it could be by many examples – in a well-known etching by Félicien Rops; and it is illustrated in the typical case of repression in the life of saints and penitents. An ascetic monk has fled, no doubt from the temptations of the world, to the image of the crucified Saviour. And now the cross sinks down like a shadow, and in its place, radiant, there rises instead the image of a voluptuous, naked woman, in the same crucified attitude. Other artists with less psychological insight have, in similar representations of temptation, shown Sin, insolent and triumphant, in some position alongside of the Saviour on the cross. Only Rops has placed Sin in the very place of the Saviour on the cross. He seems to have known that, when what has been repressed returns, it emerges from the repressing force itself.

It is worthwhile pausing in order to convince oneself from pathological cases how sensitive a human mind becomes in states of repression to any approach by what has been repressed, and how even trivial similarities suffice for the repressed to emerge behind the repressing force and take effect by means of it. I once had under medical treatment a young man – he was still almost a boy – who, after he had first unwillingly become acquainted with the processes of sex, had taken flight from every sexual desire that arose in him. For that purpose he made use of various methods of repression: he intensified his zeal in learning, exaggerated his dependence on his mother, and in general assumed a childish character. I will not here enter into the manner in which his repressed sexuality broke through once more precisely in his relation to his mother; but I will describe a rarer and stranger instance of how another of his [36]

1 ['You may drive out Nature with a pitchfork, but she will always return.' This is actually a line of Horace (*Epistles*, I, 10, 24). It is slightly misquoted in the German editions.]

bulwarks collapsed on an occasion which could scarcely be regarded as sufficient. Mathematics enjoys the greatest reputation as a diversion from sexuality. This had been the very advice to which Jean-Jacques Rousseau was obliged to listen from a lady who was dissatisfied with him: 'Lascia le donne e studia la matematica!'[1] So too our fugitive threw himself with special eagerness into the mathematics and geometry which he was taught at school, till suddenly one day his powers of comprehension were paralysed in the face of some apparently innocent problems. It was possible to establish two of these problems: 'Two bodies come together, one with a speed of . . . etc.' and 'On a cylinder, the diameter of whose surface is *m*, describe a cone . . . etc.' Other people would certainly not have regarded these as very striking allusions to sexual events; but he felt that he had been betrayed by mathematics as well, and took flight from it too.

If Norbert Hanold were someone in real life who had in this way banished love and his childhood friendship with the help of archaeology, it would have been logical and according to rule that what revived in him the forgotten memory of the girl he had loved in his childhood should be precisely an antique sculpture. It would have been his well-deserved fate
[37] to fall in love with the marble portrait of Gradiva, behind which, owing to an unexplained similarity, the living Zoe whom he had neglected made her influence felt.

Fräulein Zoe seems herself to have shared our view of the young archaeologist's delusion, for the satisfaction she expressed at the end of her 'frank, detailed and instructive speech of castigation' could scarcely have been based on anything but a recognition that from the very first his interest in Gradiva had related to herself. It was *this* which she had not expected of him, but which, in spite of all its delusional disguise, she saw for what it was. The psychical treatment she had carried out, however, had now accomplished its beneficent effect on him. He felt free, for his delusion had now been replaced with the thing of which it could only have been a distorted and inadequate copy. Nor did he any longer hesitate to remember her and to recognize her as the kind, cheerful, clever playmate who in essentials was not in any way changed. But he found something else very strange –

'You mean', said the girl, 'the fact of someone having to die so as to come alive; but no doubt that must be so for archaeologists.' (141.) Evidently she had not forgiven him yet for the roundabout path by way of

1 ['Give up women and study mathematics!']

archaeology which he had followed from their childhood friendship to the new relation that was forming.

'No, I mean your name . . . Because "Bertgang" means the same as "Gradiva" and describes someone "who steps along brilliantly".'[1] (142.)

We ourselves were unprepared for this. Our hero was beginning to cast off his humility and to play an active part. Evidently he was completely cured of his delusion and had risen above it; and he proved this by himself tearing the last threads of the cobweb of his delusion. This, too, is just how patients behave when one has loosened the compulsion [*Zwang*][T] of their delusional thoughts by revealing the repressed material lying behind them. Once they have understood, they themselves bring forward the solutions to the final and most important riddles of their strange condition in a number of ideas that suddenly occur to them. We had already guessed that the Greek origin of the imaginary Gradiva was an obscure result of the Greek name 'Zoe'; but we had not ventured to approach the name 'Gradiva' itself, and had let it pass as the untrammelled creation of Norbert Hanold's imagination. But, lo and behold! that very name now turns out to have been a derivative – indeed a translation [*Übersetzung*] – of the repressed surname of the girl he had loved in the childhood which he was supposed to have forgotten. [38]

The tracing back of the delusion and its resolution were now complete. What the author now adds is no doubt designed to serve as a harmonious end to his story. We cannot but feel reassured about the future when we hear that the young man, who had earlier been obliged to play the pitiable part of a person in urgent need of treatment, advanced still further on the road to recovery and succeeded in arousing in her some of the feelings under which he himself had suffered before. Thus it was that he made her jealous by mentioning the sympathetic young lady who had previously interrupted their tête-à-tête in the House of Meleager, and by confessing that she had been the first woman for whom he had felt a very great liking. Whereupon Zoe prepared to take a chilly leave of him, remarking that everything had now returned to reason – she herself not least; he could look up Gisa Hartleben (or whatever she was now called) again and give her some scientific assistance over the purpose of her visit to Pompeii; she herself, however, must go back to the Albergo del Sole where her father was

1 [The German root '*bert*' or '*brecht*' is akin to the English 'bright'; similarly '*gang*' is akin to 'go' and may be translated 'gait'. Hence Bertgang = 'brilliant (or splendid) gait'; see p. 39 f. below.]

expecting her for lunch; perhaps they would meet again sometime at a party in Germany or on the moon. But once more he was able to make the troublesome fly an excuse for taking possession first of her cheek and then of her lips, and to set in motion the aggressiveness which is a man's inevitable duty in love-making. Once only a shadow seemed to
[39] fall on their happiness, when Zoe declared that now she really must go back to her father or he will starve at the Sole. 'Your father? . . . what will happen? . . .' (147.) But the clever girl was able swiftly to quiet his concern. 'Probably nothing will happen. I'm not an indispensable part of his zoological collection. If I had been, perhaps I shouldn't have been so foolish as to give my heart to you.' In the exceptional event, however, of her father taking a different view from hers, there was a safe expedient. Hanold need only cross to Capri, catch a *Lacerta faraglionensis* there (he could practise the technique on her little finger), set the creature free over here, catch it again before the zoologist's eyes, and let him choose between a *faraglionensis* on the mainland and his daughter. The scheme, it is easy to see, was one in which the mockery was tinged with bitterness; it was a warning, as it were, to her fiancé not to keep too closely to the model on which she had chosen him. Here again Norbert Hanold reassures us, by showing by all sorts of apparently small signs the great transformation that had taken place in him. He proposed that he and his Zoe should come for their honeymoon to Italy and Pompeii, just as though he had never been indignant with the honeymooning Edwins and Angelinas. He had completely lost from his memory all his feelings against those happy pairs, who had so unnecessarily travelled more than a hundred miles from their German home. The author is certainly right in bringing forward a loss of memory like this as the most trustworthy sign of a change of attitude. Zoe's reply to the plan for the scene of their honeymoon suggested by 'her childhood friend who had also in a sense been dug out of the ruins again' (150) was that she did not feel quite alive enough yet to make a geographical decision of that sort.

The delusion had now been conquered by a beautiful reality; but before the two lovers left Pompeii it was still to be honoured once again. When they reached the Herculanean Gate, where, at the entrance to the Via Consolare, the street is crossed by some ancient stepping-stones,
[40] Norbert Hanold paused and asked the girl to go ahead of him. She understood him 'and, pulling up her dress a little with her left hand, Zoe Bertgang, Gradiva *rediviva*, walked past, held in his eyes, which seemed to gaze as though in a dream; so, with her quietly tripping gait, she

stepped through the sunlight over the stepping-stones, to the other side of the street.' With the triumph of love, what was beautiful and precious in the delusion found recognition as well.

In his last simile, however – of the 'childhood friend who had been dug out of the ruins' – the author has presented us with the key to the symbolism of which the hero's delusion made use in disguising his repressed memory. There is, in fact, no better analogy for repression, by which something in the mind is at once made inaccessible and preserved, than burial of the sort to which Pompeii fell victim and from which it could emerge once more through the work of spades. Thus it was that the young archaeologist was obliged in his phantasy to transport to Pompeii the original of the relief which reminded him of the object of his youthful love. The author was well justified, indeed, in lingering over the valuable similarity which his delicate sense had perceived between a particular mental process in the individual and an isolated historical event in the history of mankind.[1]

1 [Freud himself adopted the fate of Pompeii as a simile for repression in more than one later passage. See, for instance, the 'Rat Man' case history (1909*d*), written not long after the present work; *RSE*, **10**, 136.]

II

[41] But after all, what we really intended to do originally was only to investigate two or three dreams that are to be found here and there in *Gradiva* with the help of certain analytic methods. How has it come about, then, that we have been led into dissecting the whole story and examining the mental processes in the two chief characters? This has not in fact been an unnecessary piece of work; it was an essential preliminary. It is equally the case that when we try to understand the real dreams of a real person we have to concern ourselves intensively with his character and his career, and we must get to know not only his experiences shortly before the dream but also those dating far back into the past. It is even my view that we are still not free to turn to our proper task, but that we must linger a little more over the story itself and carry out some further preliminary work.

My readers will no doubt have been puzzled to notice that so far I have treated Norbert Hanold and Zoe Bertgang, in all their mental manifestations and activities, as though they were real people and not the author's creations, as though the author's mind were an absolutely transparent medium and not a refractive or obscuring one. And my procedure must seem all the more puzzling since the author has expressly renounced the portrayal of reality by calling his story a 'phantasy'. We have found, however, that all his descriptions are so faithfully copied from reality that we should not object if *Gradiva* were described not as a phantasy but as a psychiatric study. Only at two points has the author availed himself of the licence open to him of laying down premises which do not seem to have their roots in the laws of reality. The first time is where he makes the young archaeologist come upon what is undoubtedly an
[42] ancient relief but which so closely resembles a person living long afterwards, not only in the peculiarity of the posture of the foot as it steps along but in every detail of facial structure and bodily attitude, that the young man is able to take the physical appearance of that person to be the sculpture come to life. And the second time is where he makes the young man meet the living woman precisely in Pompeii; for the dead woman had been placed there only by his imagination, and the journey to Pompeii had in fact carried him away from the living woman, whom he had just seen in the street of the town in which he lived. This second

provision of the author's, however, involves no violent departure from actual possibility; it merely makes use of chance, which unquestionably plays a part in many human histories; and furthermore he uses it to good purpose, for this chance reflects the fatal truth that has laid it down that flight is precisely an instrument that delivers one over to what one is fleeing from. The first premise seems to lean more towards phantasy and to spring entirely from the author's arbitrary decision – the premise on which all that follows depends, the far-reaching resemblance between the sculpture and the live girl, which a more sober choice might have restricted to the single feature of the posture of the foot as it steps along. We might be tempted here to allow the play of our own phantasy to forge a link with reality. The name of 'Bertgang' might point to the fact that the women of that family had already been distinguished in ancient days by the peculiarity of their graceful gait; and we might suppose that the Germanic Bertgangs were descended from a Roman family one member of which was the woman who had led the artist to perpetuate the peculiarity of her gait in the sculpture. Since, however, the different variations of the human form are not independent of one another, and since in fact even among ourselves the ancient types reappear again and again (as we can see in art collections), it would not be totally impossible that a modern Bertgang might reproduce the shape of her ancient ancestress in all the other features of her bodily structure as well. But it would no doubt be wiser, instead of such speculations, to enquire from the author [43] himself what were the sources from which this part of his creation was derived; we should then have a good prospect of showing once again how what was ostensibly an arbitrary decision rested in fact upon law. But since access to the sources in the author's mind is not open to us,[1] we will leave him with an undiminished right to construct a development that is wholly true to life upon an improbable premise – a right of which Shakespeare, for instance, availed himself in *King Lear*.[2]

Apart from this, it must be repeated, the author has presented us with a perfectly correct psychiatric study, on which we may measure our understanding of the workings of the mind – a case history and the history of a cure which might have been designed to emphasize certain fundamental theories of medical psychology. It is strange enough that the author should have done this. But how if, on being questioned, he were completely to deny any such purpose? It is so easy to draw

1 [Cf. the 'Postscript' to this work, p. 74 below.]

2 [Some further comment on the 'improbable premise' to *King Lear* can be found at the end of Freud's paper on 'The Theme of the Three Caskets' (1913*f*), *RSE*, **12**, 298.]

analogies and to read meanings into things. Is it not rather we who have slipped into this charming poetic story a secret meaning very far from its author's intentions? Possibly. We shall come back to the question later. For the moment, however, we have tried to save ourselves from making any such tendentious interpretation by giving the story almost entirely in the author's own words. Anyone who compares our reproduction with the actual text of *Gradiva* will have to concede us that much.

Perhaps, too, in most people's eyes we are doing our author a poor service in declaring his work to be a psychiatric study. An author, we hear them say, should keep out of the way of any contact with psychiatry and should leave the description of pathological mental states to the doctors. The truth is that no truly creative writer has ever obeyed this injunction. The description of the human mind is indeed the
[44] domain which is most his own; he has from time immemorial been the precursor to science, and so too to scientific psychology. But the frontier between states of mind described as normal and pathological is in part a conventional one and in part so fluctuating that each of us probably crosses it many times in the course of a day. On the other hand, psychiatry would be doing wrong if it tried to restrict itself permanently to the study of the severe and gloomy illnesses that arise from gross injuries to the delicate apparatus of the mind. Deviations from health which are slighter and capable of correction, and which today we can trace back no further than to disturbances in the interplay of mental forces, arouse its interest no less. Indeed, only through the medium of these can it understand either normal states or the phenomena of severe illness. Thus the creative writer cannot evade the psychiatrist nor the psychiatrist the creative writer, and the poetic treatment of a psychiatric theme can turn out to be correct without any sacrifice of its beauty.[1]

And it is really correct – this imaginative picture of the history of a case and its treatment. Now that we have finished telling the story and satisfied our own suspense, we can get a better view of it, and we shall now reproduce it with the technical terminology of our science, and in doing so we shall not feel disconcerted at the necessity for repeating what we have said before.

Norbert Hanold's condition is often spoken of by the author as a 'delusion', and we have no reason to reject that designation. We can state

1 [Another discussion by Freud of the use of psychopathological material by creative writers can be found in a posthumously published essay, 'Psychopathic Characters on the Stage' (*1942a*), probably written a year or two before the present work. Cf. *RSE*, 7, 295 ff.]

two chief characteristics of a 'delusion', which do not, it is true, describe it exhaustively, but which distinguish it recognizably from other disorders. In the first place, it is one of the group of pathological states which do not produce a direct effect upon the body but are manifested only by mental indications. And secondly, it is characterized by the fact that in it [45] 'phantasies' have gained the upper hand – that is, have obtained belief and have acquired an influence on action. If we recall Hanold's journey to Pompeii in order to look for Gradiva's peculiarly formed footprints in the ashes, we shall have a fine example of an action under the dominance of a delusion. A psychiatrist would perhaps place Norbert Hanold's delusion in the great group of 'paranoia' and possibly describe it as 'fetishistic erotomania', because the most striking thing about it was his being in love with the piece of sculpture and because in the psychiatrist's view, with its tendency to coarsen everything, the young archaeologist's interest in the feet and postures of feet of females [*weiblicher Personen*][1] would be bound to suggest 'fetishism'. Nevertheless, all such systems of nomenclature and classification of the different kinds of delusion according to their subject matter have something precarious and barren about them.[2]

Furthermore, since our hero was a person capable of developing a delusion on the basis of such a strange preference, a strict psychiatrist would at once stamp him as a *dégénéré* and would investigate the heredity which had remorselessly driven him to this fate. But here the author does not follow the psychiatrist, and with good reason. He wishes to bring the hero closer to us so as to make 'empathy' ['*Einfühlung*'][T] easier; the diagnosis of '*dégénéré*', whether it is right or wrong, at once puts the young archaeologist at a distance from us, for we readers are the normal people and the standard of humanity. Nor is the author greatly concerned with the hereditary and constitutional preconditions of the state, but, on the other hand, he plunges deep into the personal mental make-up which can give rise to such a delusion.

In one important respect Norbert Hanold behaved quite differently from an ordinary human being. He took no interest in living women; the science of which he was the servant had taken that interest away from him and displaced [*verschoben*] it on to women of marble or bronze. This [46] is not to be regarded as a trivial peculiarity; on the contrary, it was the basic precondition of the events to be described. For one day it came

1 [These two words were omitted in Strachey's *SE* translation.]

2 In point of fact, the case of N. H. would have to be described as a *hysterical* delusion, not a paranoic one. The indications of paranoia are absent from it.

about that one particular sculpture of that kind laid claim to the whole of the interest which is ordinarily directed only to a living woman, and with that his delusion was there. We then see unrolled before our eyes the manner in which his delusion is cured through a happy turn of events, and his interest displaced back from the marble to a living woman. The author does not let us follow the influences which led our hero to turn away from women; he informs us only that his attitude was not explained by his innate disposition, which, on the contrary, included some amount of imaginative (and, we might add, erotic) needs. And, as we learn later in the story, he did not avoid other children in his childhood: he had a friendship at that age with a little girl, was her inseparable companion, shared his little meals with her, used to thump her too and let her rumple his hair. It is in attachments [*Anhänglichkeit*] such as this, in combinations like this of affection and aggressiveness, that the immature erotism of childhood finds its expression; its consequences emerge only later [*nachträglich*][T], but then they are irresistible, and during childhood itself it is as a rule recognized as erotism only by doctors and creative writers. Our own writer shows us clearly that he too is of the same opinion; for he makes his hero suddenly develop a lively interest in women's feet and their way of placing them. This interest was bound to bring him a bad reputation both among scientists and among the women of the town he lived in, a reputation of being a foot fetishist; but *we* cannot avoid tracing the interest back to the memory of his childhood playmate. For there can be no doubt that even in her childhood the girl showed the same peculiarity of a graceful gait, with her toes almost perpendicularly raised as she stepped along; and it was because it represented that same gait that an ancient marble relief acquired such great importance for Norbert Hanold. Incidentally, we may add that in his derivation of the remarkable phenomenon of fetishism the author is in complete agreement with science. Ever since Binet [1888] we have in fact tried to trace fetishism back to erotic impressions in childhood.[1]

Nachträglichkeit

[47]

The state of permanently turning away from women produces a personal susceptibility, or, as we are accustomed to say, a 'disposition' to the formation [*Bildung*] of a delusion. The development of the mental disorder sets in at the moment when a chance impression arouses the childhood experiences which have been forgotten and which have traces, at least, of an erotic colouring. 'Arouses' [*Aufweckt*], however, is

1 [Binet's views on fetishism were described in Freud's *Three Essays on the Theory of Sexuality* (1905*d*), to which, however, he added a footnote in 1920 casting doubts on their adequacy. A number of references to other discussions of fetishism in Freud's own writings are given in another footnote to the same passage (*RSE*, **7**, 138 *n.* 3).]

certainly not the right description, if we take into account what follows. We must repeat the author's accurate account in correct psychological technical terms. When Norbert Hanold saw the relief, he did not remember that he had already seen a similar posture of the foot in his childhood friend; he remembered nothing at all, but all the effects brought about by the relief originated from this link that was made with the impression of his childhood. Thus the childhood impression was stirred up [*rege*], it became active, so that it began to produce effects, but it did not come into consciousness – it remained 'unconscious', to use a term which has today become unavoidable in psychopathology. We are anxious that this unconscious shall not be involved in any of the disputes of philosophers and natural philosophers, which have often no more than an etymological importance. For the time being we possess no better name for psychical processes which behave actively but nevertheless do not reach the consciousness of the person concerned, and that is all we mean by our 'unconsciousness'. When some thinkers try to dispute the existence of an unconscious of this kind, on the ground that it is nonsensical, we can only suppose that they have never had to do with the corresponding mental phenomena, that they are under the spell of the regular experi- [48]
ence that everything mental that becomes active and intense becomes at the same time conscious as well, and that they have still to learn (what our author knows very well) that there are most certainly mental processes which, in spite of being intense and producing effects, nonetheless remain apart from consciousness.

We said a little earlier [p. 26 ff.] that Norbert Hanold's memories of his childhood relations with Zoe were in a state of 'repression'; and here we have called them 'unconscious' memories. So we must now pay a little attention to the relation between these two technical terms, which, indeed, appear to coincide in their meaning. It is not difficult to make the matter plain. 'Unconscious' is the wider concept; 'repressed' is the narrower one. Everything that is repressed is unconscious; but we cannot assert that everything unconscious is repressed. If when Hanold saw the relief he had remembered his Zoe's gait, what had earlier been an unconscious memory of his would have become simultaneously active and conscious, and this would have shown that it had not been repressed earlier. 'Unconscious' is a purely descriptive term, one that is indefinite in some respects and, as we might say, static. 'Repressed' is a dynamic expression, which takes account of the interplay of mental forces; it implies that there is a force present which is seeking to bring about all kinds of psychical effects, including that of becoming conscious, but that

there is also an opposing force which is able to obstruct some of these psychical effects, once more including that of becoming conscious. The mark of something repressed is precisely that in spite of its intensity it is unable to enter consciousness. In Hanold's case, therefore, from the moment of the appearance of the relief onwards, we are concerned with something unconscious that is repressed, or, more briefly, with something repressed.

Norbert Hanold's memories of his childhood relations with the girl with the graceful gait were repressed; but this is not yet the correct view of the psychological situation. We remain on the surface so long as we are
[49] dealing only with memories and ideas. What is alone of value in mental life is rather the feelings. No mental forces are significant unless they possess the characteristic of arousing feelings. Ideas are only repressed because they are associated with the release of feelings which ought not to occur. It would be more correct to say that repression acts upon feelings, but we can only be aware of these in their association with ideas.[1] So that it was Norbert Hanold's erotic feelings that were repressed; and since his erotism knew and had known no other object than Zoe Bertgang in his childhood, his memories of her were forgotten. The ancient relief aroused the slumbering erotism in him, and made his childhood memories active. On account of a resistance to erotism that was present in him, these memories could only become operative as unconscious ones. What now took place in him was a struggle between the power [*Macht*] of erotism and that of the forces [*Kräften*][T] that were repressing it; the manifestation of this struggle was a delusion.

Our author has omitted to give the reasons which led to the repression of the erotic life of his hero; for of course Hanold's concern with science was only the instrument which the repression employed. A doctor would have to dig deeper here, but perhaps without hitting upon the reason in this case. But, as we have insisted with admiration, the author has not failed to show us how the arousing of the repressed erotism came precisely from the field of the instruments that served to bring about the repression. It was right that an antique, the marble sculpture of a woman, should have been what tore our archaeologist away from his retreat from love and warned him to pay off the debt to life with which we are burdened from our birth.

1 [Some of this would need to be expressed differently in order to fit in with Freud's later and more elaborate discussions of repression, which are to be found, for instance, in Sections III and IV of his paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 156 ff.]

The first manifestations of the process that had been set going in Hanold by the relief were phantasies, which played around the figure represented in it. The figure seemed to him to have something 'of today' [50] about her, in the best sense of the words, and it was as though the artist had captured her 'from life' stepping along the street. He gave the girl in the ancient relief the name of 'Gradiva', which he constructed on the model of an epithet of the war god striding into battle – 'Mars Gradivus'. He endowed her personality with more and more characteristics. She may have been the daughter of a respected personage, of a patrician, perhaps, who was connected with the temple service of a deity. He thought he could trace a Greek origin in her features; and finally he felt compelled to remove her from the busy life of a capital and to transport her to the more peaceful Pompeii, and there he made her step across the lava stepping-stones which made it possible to cross from one side of the street to the other [p. 8 above]. These products of his phantasy seem arbitrary enough, but at the same time innocently unsuspicious. And, indeed, even when for the first time they gave rise to an incitement to action – when the archaeologist, obsessed by the problem of whether this posture of the feet corresponded to reality, began to make observations from life in order to examine the feet of contemporary women and girls – even this action was screened by conscious scientific motives, as though all his interest in the sculpture of Gradiva had sprung from the soil of his professional concern with archaeology [p. 9]. The women and girls in the street, whom he chose as the subjects of his investigation, must, of course, have taken another, crudely erotic view [*Auffassung*][T] of his behaviour, and we cannot but think them right. We ourselves can be in no doubt that Hanold was as much in ignorance of the motives of his researches as he was of the origin of his phantasies about Gradiva. These, as we learnt later, were echoes of his memories of his youthful love, derivatives of those memories, transformations and distortions of them, after they had failed to make their way into his consciousness in an unmodified form. The ostensibly aesthetic judgement that the sculpture had something 'of today' about it took the place of his knowledge that a gait of that kind [51] belonged to a girl whom he knew and who stepped across the street *at the present time*. Behind the impression of the sculpture being 'from life' and the phantasy of its subject being Greek lay his memory of the name Zoe, which means 'life' in Greek. 'Gradiva', as we learn from our hero himself at the end of the story, after he has been cured of his delusion, is a good translation of the surname 'Bertgang' which means

something like 'someone who steps along brilliantly or splendidly' [p. 29 above]. The details about Gradiva's father originated from Hanold's knowledge that Zoe Bertgang was the daughter of a respected teacher at the university, which can well be translated into classical terms as 'temple service'. Finally, his phantasy transported her to Pompeii, not 'because her quiet, calm nature seemed to demand it', but because no other or better analogy could be found in his science for his remarkable state, in which he became aware of his memories of his childhood friendship through obscure channels of information. Once he had made his own childhood coincide with the classical past (which it was so easy for him to do), there was a perfect similarity between the burial of Pompeii – the disappearance of the past combined with its preservation – and repression, of which he possessed a knowledge through what might be described as 'endopsychic' perception.[1] In this he was employing the same symbolism that the author makes the girl use consciously towards the conclusion of the story: 'I told myself I should be able to dig out something interesting here even by myself. Of course, I hadn't counted on making the find that I have . . .' (124 [p. 21 above].) And at the very end she replied to Hanold's plan for their honeymoon with a reference to 'her childhood friend who had also in a sense been dug out of the ruins again'. (150 [p. 30].)

Thus in the very first products of Hanold's delusional phantasies and actions we already find a double set of determinants, a derivation from two different sources. One of these is the one that was manifest to Hanold himself, the other is the one which is revealed to us when we examine his
[52] mental processes. One of them, looked at from Hanold's point of view, was conscious to him, the other was completely unconscious to him. One of them was derived wholly from the circle of ideas of the science of archaeology, the other arose from the repressed childhood memories that had become active in him and from the emotional drives [*Gefühlstrieben*][T]
Trieb attached to them. One might be described as lying on the surface and covering the other, which was, as it were, concealed behind it. The scientific motivation might be said to serve as a pretext for the unconscious erotic one, and science had put itself completely at the service of the delusion. It should not be forgotten, however, that the unconscious determinants could not effect anything that did not simultaneously satisfy the conscious, scientific ones. The symptoms of a delusion – phantasies and actions alike – are in fact the products of compromise

1 [Cf. *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 222, and the 'Rat Man' case history (1909*d*), ibid., **10**, 176.]

between the two mental currents, and in a compromise account is taken of the demands of each of the two parties to it; but each side must also renounce a part of what it wanted to achieve. Where a compromise comes about it must have been preceded by a struggle – in this case it was the conflict we have assumed between suppressed erotism and the forces that were keeping it in repression. In the formation of a delusion this struggle is in fact unending. Assault and resistance are renewed after the construction of each compromise [*Kompromissbildung*], which is never, so to speak, entirely satisfying. Our author too is aware of this, and that is why he makes a peculiar unrest dominate this stage of his hero's disorder, as a precursor to and guarantee of further developments.

These significant peculiarities – the double motivation of phantasies and decisions, and the construction of conscious pretexts for actions to whose motivation the repressed has made the major contribution – will meet us often, and perhaps more clearly, in the further course of the story. And this is just as it should be, for the author has thus grasped and represented the unfailing chief characteristic of pathological mental processes.

The development of Norbert Hanold's delusion proceeded with a dream [53] which, since it was not occasioned by any new event, seems to have arisen entirely out of his mind, filled as it was by a conflict. But let us pause before we enquire whether, in the construction of his dreams, too, the author meets our expectation that he possesses a deep understanding. Let us ask first what psychiatric science has to say to his hypotheses about the origin of a delusion and what attitude it takes to the part played by repression and the unconscious, to conflict and to the formation of compromises. In short, let us ask whether this imaginative representation of the genesis of a delusion can hold its own before the judgement of science.

And here we must give what will perhaps be an unexpected answer. In fact the situation is quite the reverse: it is science that cannot hold its own before the achievement of the author. Science allows a gulf to yawn between the hereditary and constitutional preconditions of a delusion and its creations, which seem to emerge ready-made – a gulf which we find that our author has filled. Science does not as yet suspect the importance of repression, it does not recognize that in order to explain the world of psychopathological phenomena the unconscious is absolutely essential, it does not look for the basis of delusions in a psychical conflict, and it does not regard their symptoms as compromises. Does

our author stand alone, then, in the face of united science? No, that is not the case (if, that is, I may count my own works as part of science), since for a number of years – and, until recently, more or less alone[1] – I myself have supported all the views that I have here extracted from Jensen's *Gradiva* and stated in technical terms. I indicated, in most detail in connection with the states known as hysteria and obsessions, that the
[54] individual determinant[2] of these psychical disorders is the suppression of a part of drive activity and the repression of the ideas by which the suppressed drive is represented, and soon afterwards I repeated the same views in relation to some forms of delusion.[3] The question whether the drives concerned in this causation are always components of the sexual drive or may be of another kind as well is a problem which may be regarded as a matter of indifference in the particular case of the analysis of *Gradiva*; for in the instance chosen by our author what was at issue was quite certainly nothing other than the suppression of erotic feelings. The validity of the hypotheses of psychical conflict and of the formation of symptoms by means of compromises between the two mental currents struggling against each other has been demonstrated by me in the case of patients observed and medically treated in real life, just as I have been able to in the imaginary case of Norbert Hanold.[4] Even before me, Pierre Janet, a pupil of the great Charcot, and Josef Breuer, in collaboration with me, had traced back the products of neurotic, and especially of hysterical, illness to the power of unconscious thoughts.[5]

When, from the year 1893 onwards, I plunged into investigations such as these of the origin of mental disturbances, it would certainly never have occurred to me to look for a confirmation of my findings in imaginative writings. I was thus more than a little surprised to find that the author of *Gradiva*, which was published in 1903, had taken as the basis of its creation the very thing that I believed myself to have freshly discovered from the sources of my medical experience. How was it that the author arrived at the same knowledge as the doctor – or at least behaved as though he possessed the same knowledge?

1 See Bleuler's important work, *Affektivität, Suggestibilität, Paranoia* and C. G. Jung's *Diagnostische Assoziationsstudien*, both published in Zürich in 1906. – [*Added* 1912:] Today, in 1912, I am able to retract what is said above as being no longer true. Since it was written, the 'psychoanalytic movement' started by me has become widely extended, and it is constantly growing.

2 [As contrasted, presumably, with a more general, inherited factor.]

3 See the author's *Sammlung kleiner Schriften zur Neurosenlehre*, 1906 [in particular the second paper on 'The Neuropsychoses of Defence' (1896*b*), *RSE*, **3**, 173 ff.].

4 Cf. 'Fragment of an Analysis of a Case of Hysteria' (1905*e*) [ibid., **7**, 7 ff.].

5 Cf. *Studies on Hysteria* (Freud, 1895*d*, with Breuer) [ibid., **2**].

Norbert Hanold's delusion, as I was saying, was carried a step further by a dream which occurred in the middle of his efforts to discover a gait like [55]
Gradiva's in the streets of the town where he lived. It is easy to give the content of this dream in brief. The dreamer found himself in Pompeii on the day on which that unhappy city was destroyed, and experienced its horrors without being in danger himself; he suddenly saw Gradiva stepping along there, and understood all at once, as though it was something quite natural, that since she was a Pompeian, she was living in her native town, and 'without his having suspected it, living as his contemporary' [p. 9 above]. He was seized with fear on her account and gave a warning cry, whereupon she turned her face towards him for a moment. But she proceeded on her way without paying any attention to him, lay down on the steps of the Temple of Apollo, and was buried in the rain of ashes after her face had lost its colour, as though it were turning into white marble, until it had become just like a piece of sculpture. As he was waking up, he interpreted the noises of a big city penetrating into his bedroom as the cries for help of the despairing inhabitants of Pompeii and the thunder of the wildly agitated sea. The feeling that what he had dreamt had really happened to him would not leave him for some time after he had awoken, and a conviction that Gradiva had lived in Pompeii and had perished there on the fatal day was left over with him by the dream as a fresh starting point for his delusion.

It is not so easy for us to say what the author intended with this dream and what caused him to link the development of the delusion precisely to a dream. Zealous investigators, it is true, have collected plenty of examples of the way in which mental disturbances are linked to dreams and arise out of dreams.[1] It appears, too, that in the lives of a few eminent men impulses to important actions and decisions have originated from dreams. But these analogies are not of much help to our understanding; so let us keep to our present case, our author's imaginary case of Norbert Hanold the archaeologist. By which end are we to take hold of a dream [56]
like this so as to fit it into the whole context, if it is not to remain no more than an unnecessary decoration of the story?

I can well imagine that at this point a reader may exclaim: 'The dream is quite easily explained – it is a simple anxiety dream, occasioned by the noises of the city, which were misinterpreted into the destruction of Pompeii by the archaeologist, whose mind was occupied with his Pompeian girl.' In view of the low opinion generally prevailing of the

1 Sante de Sanctis (1899). [Cf. *The Interpretation of Dreams* (1900*a*), Chapter I, Section H; *RSE*, **4**, 78 ff.]

performances of dreams, all that is usually asked from an explanation of one is that some external stimulus shall be found that more or less coincides with a piece of the dream's content. This external stimulus to dreaming would be supplied by the noise which woke the sleeper; and with this, interest in the dream would be exhausted. If only we had some reason for supposing that the town was noisier than usual that morning! If only, for instance, the author had not omitted to tell us that Hanold, against his usual practice, had slept that night with his windows open! What a pity the author did not take the trouble to do that! And if only anxiety dreams were as simple as that! But no, interest in the dream is not so easily exhausted.

There is nothing essential for the construction of a dream in a link with an external sensory stimulus. A sleeper can disregard a stimulus of this kind from the external world, or he can allow himself to be awakened by it without constructing a dream, or, as happened here, he can weave it into his dream if that suits him for some other reason; and there are numerous dreams of which it is impossible to show that their content was determined in this way by a stimulus impinging on the sleeper's senses.[1] No, we must try another path.

We may perhaps find a starting point in the after-effects left by the dream in Hanold's waking life. Up to then he had had a phantasy that Gradiva had been a Pompeian. This hypothesis now became a certainty
[57] for him, and a second certainty followed – that she was buried along with the rest in the year 79 A.D.[2] Melancholy feelings accompanied this extension of the delusional structure, like an echo of the anxiety which had filled the dream. This fresh pain about Gradiva does not seem very intelligible to us; Gradiva would have been dead for many centuries even if she had been saved from destruction in the year 79 A.D. Or ought we not to argue in this kind of way either with Norbert Hanold or with the author himself? Here again there seems no path to an understanding. Nevertheless, it is worth remarking that the increment which the delusion acquired from this dream was accompanied by a feeling with a highly painful colouring.

Apart from that, however, we are as much at a loss as before. This dream is not self-explanatory, and we must resolve to borrow from my *Interpretation of Dreams* and apply to the present example a few of the rules to be found in it for the solution of dreams.

1 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 198 f.]

2 See the text of *Gradiva* (15).

One of these rules is to the effect that a dream is invariably related to the events of the day before the dream.[1] Our author seems to be wishing to show that he has followed this rule, for he attaches the dream immediately to Hanold's 'pedestrian researches'. Now these had no meaning other than a search for Gradiva, whose characteristic gait he was trying to recognize. So the dream ought to have contained an indication of where Gradiva was to be found. And it does so, by showing her in Pompeii; but that is no novelty to us.

Another rule tells us that, if a belief in the reality of the dream images persists unusually long, so that one cannot tear oneself out of the dream, this is not a mistaken judgement provoked by the vividness of the dream images, but is a psychical act on its own: it is an assurance, relating to the content of the dream, that something in it is really as one has dreamt it;[2] and it is right to have faith in this assurance. If we keep to these two [58]
rules, we must conclude that the dream gave some information as to the whereabouts of the Gradiva he was in search of, and that that information tallied with the real state of things. We know Hanold's dream: does the application of these two rules to it yield any reasonable sense?

Strange to say, it does. The sense is merely disguised in a particular way so that it is not immediately recognizable. Hanold learnt in the dream that the girl he was looking for was living in a town and contemporaneously with him. Now this was true of Zoe Bertgang; only in the dream the town was not the German university town but Pompeii, and the time was not the present but the year 79 A.D. It is, as it were, a distortion by displacement: what we have is not Gradiva in the present but the dreamer transported into the past. Nevertheless, in this manner, the essential and new fact is stated: *he is in the same place and time as the girl he is looking for*. But whence come this displacement and disguise which were bound to deceive both us and the dreamer over the true meaning and content of the dream? Well, we already have the means at our disposal for giving a satisfactory answer to that question.

Let us recall all that we have heard about the nature and origin of the phantasies which are the precursors to delusions [p. 34 ff. above]. They are substitutes for and derivatives of repressed memories which a resistance will not allow to enter consciousness unaltered, but which can purchase the possibility of becoming conscious by taking account, by means of changes and distortions, of the resistance's censorship [*Zensur*]. When this compromise has been accomplished, the memories have turned into

1 [*The Interpretation of Dreams* (1900*a*), Chapter V, Section A; *RSE*, **4**, 146 ff.]

2 [Ibid., **4**, 166, and **5**, 333. See also the 'Wolf Man' dream (ibid., **17**, 26).]

the phantasies, which can easily be misunderstood by the conscious personality – that is, understood so as to fit in with the dominant psychical current. Now let us suppose that dream images are what might be described as the creations of people's physiological [i.e. non-pathological] delusions – the products of the compromise in the struggle
[59] between what is repressed and what is dominant which is probably present in every human being, including those who in the daytime are perfectly sound in mind. We shall then understand that dream images have to be regarded as something distorted, behind which something else must be looked for, something *not* distorted, but in some sense objectionable, like Hanold's repressed memories behind his phantasies. We can give expression to the contrast which we have thus recognized, by distinguishing what the dreamer remembers when he wakes up as the *manifest content of the dream* from what constituted the basis of the dream before the distortion imposed by the censorship – namely, the *latent dream thoughts*. Thus, interpreting a dream consists in translating the manifest content of the dream into the latent dream thoughts, in undoing the distortion which the dream thoughts have had to submit to from the censorship of the resistance. If we apply these notions to the dream we are concerned with, we shall find that its latent dream thoughts can only have been: 'the girl you are looking for with the graceful gait is really living in this town with you.' But in that form the thought could not become conscious. It was obstructed by the fact that a phantasy had laid it down, as the result of an earlier compromise, that Gradiva was a Pompeian; consequently, if the real fact that she was living in the same place and at the same time was to be affirmed, there was no choice but to adopt the distortion: 'You are living at Pompeii at the time of Gradiva.' This then was the idea which was realized by the manifest content of the dream, and was represented as a present event actually being experienced.

It is only rarely that a dream represents, or, as we might say, 'stages', a single thought: there are usually a number of them, a tissue of thoughts. Another component of the content of Hanold's dream can be detached, the distortion of which can easily be got rid of, so that the latent idea represented by it can be detected. This is a piece of the dream to which once again it is possible to extend the assurance of reality with which the dream ended. In the dream Gradiva as she steps along is transformed
[60] into a marble sculpture. This is no more than an ingenious and poetical representation of the real event. Hanold had in fact transferred his interest from the living girl to the sculpture: the girl he loved had been transformed for him into a marble relief. The latent dream thoughts,

which were bound to remain unconscious, sought to change the sculpture back into the living girl; what they were saying to him accordingly was something like: 'After all, you're only interested in the statue of Gradiva because it reminds you of Zoe, who is living here and now.' But if this discovery could have become conscious, it would have meant the end of the delusion.

Are we perhaps under an obligation to replace in this way each separate piece of the manifest content of the dream by unconscious thoughts? Strictly speaking, yes; if we were interpreting a dream that had really been dreamt, we could not avoid that duty. But in that case, too, the dreamer would have to give us the most copious explanations. Clearly we cannot carry out this requirement in the case of the author's creation; nevertheless, we shall not overlook the fact that we have not yet submitted the main content of the dream to the process of interpretation or translation [*Deutungs- oder Übersetzungsarbeit*]T. *Deutung*

For Hanold's dream was an anxiety dream [*Angsttraum*]. Its content was frightening, the dreamer felt anxiety while he slept and he was left with painful feelings afterwards. Now this is far from convenient for our attempt at an explanation; and we must once again borrow heavily from the theory of dream interpretation. We are warned by that theory not to fall into the error of tracing the anxiety that may be felt in a dream to the content of the dream, and not to treat the content of the dream as though it were the content of an idea occurring in waking life. It points out to us how often we dream the most ghastly things without feeling a trace of anxiety. The true situation, we learn, is quite a different one, which cannot be easily guessed, but which can be proved with certainty. The anxiety in anxiety dreams, like neurotic anxiety in general, corresponds to a sexual affect, a libidinal feeling, and arises out of libido [61] by the process of repression.[1] When we interpret a dream, therefore, we must replace anxiety with sexual excitement. The anxiety that originates in this way has – not invariably, but frequently – a selective influence on the content of the dream and introduces into it ideational elements which seem, when the dream is looked at from a conscious and mistaken point of view, to be appropriate to the affect of anxiety. As I have said, this is not invariably so, for there are plenty of anxiety dreams in which the content is not in the least frightening and where it is therefore impossible to give an explanation on conscious lines of the anxiety that is felt.

1 Cf. my first paper on the anxiety neurosis (1895*b*) and *The Interpretation of Dreams*. [*RSE*, **4**, 143, and **5**, 521 ff. – In his *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, Freud put forward an amended view of the origin of anxiety.]

I am aware that this explanation of anxiety in dreams sounds very strange and is not easy to credit; but I can only advise the reader to come to terms with it. Moreover, it would be a very remarkable thing if Norbert Hanold's dream could be reconciled with this view of anxiety and could be explained in that way. On that basis, we should say that the dreamer's erotic longings were stirred up during the night and made a powerful effort to make conscious his memory of the girl he loved and so to tear him out of his delusion, but that those longings met with a fresh repudiation and were transformed into anxiety, which in its turn introduced into the content of the dream the terrifying pictures from the memories of his schooldays. In this manner the true unconscious content of the dream, his passionate longing for the Zoe he had once known, became transformed into its manifest content of the destruction of Pompeii and the loss of Gradiva.

So far, I think, it sounds plausible. But it might justly be insisted that, if erotic wishes constitute the undistorted content of the dream, it ought also to be possible to point at least to some recognizable residue of those
[62] wishes concealed somewhere in the transformed dream. Well, even that may be possible, with the help of a hint from a later part of the story. When Hanold had his first meeting with the supposed Gradiva, he recollected the dream and begged the apparition to lie down again as he had seen her do then [p. 14 above].[1] Thereupon, however, the young lady rose indignantly and left her strange companion, for she had detected the improper erotic wish behind what he had said under the domination of his delusion. We must, I think, accept Gradiva's interpretation; even in a real dream we cannot always expect to find a more definite expression of an erotic wish.

The application of a few of the rules of dream interpretation to Hanold's first dream has thus resulted in making it intelligible to us in its main features and in inserting it into the nexus of the story. Surely, then, the author must have observed these rules in creating it? We might ask another question, too: why did the author introduce a dream at all to bring about the further development of the delusion? In my opinion it was an ingenious notion and once again true to reality. We have already heard [p. 43] that in real illnesses a delusion very often arises in connection with a dream, and, after what we have learnt about the nature of dreams, there is no need to see a fresh riddle in this fact. Dreams and

1 'No I didn't hear you speak. But I called to you when you lay down to sleep, and I stood beside you then – your face was as peaceful and beautiful as marble. May I beg of you – lie down once more on the step as you did then.' (70.)

delusions arise from the same source – from what is repressed. Dreams are, as one might say, the physiological delusions of normal people. [Cf. p. 46 above.] Before what is repressed has become strong enough to break through into waking life as a delusion, it may easily have achieved a first success, under the more favourable conditions of the state of sleep, in the form of a dream with persisting effects. For during sleep, along with a general lowering of mental activity, there is a relaxation in the strength of the resistance with which the dominant psychical forces oppose what is repressed. It is this relaxation that makes the formation [63]
of dreams possible, and that is why dreams give us our best access to a knowledge of the unconscious part of the mind – except that, as a rule, with the re-establishment of the psychical cathexes [*Besetzungen*][T] of waking life, the dream once more takes to flight and the ground that had been won by the unconscious is evacuated once again.

III

[64] In the further course of the story there is yet another dream, which may perhaps tempt us even more than the first to try to translate it and insert it into the train of events in the hero's mind.[1] But we should save very little by diverging from the author's account and hurrying on immediately to this second dream; for no-one who wishes to analyse someone else's dream can avoid turning his attention in the greatest detail to all the dreamer's experiences, both external and internal. It will probably be best, therefore, to keep close to the thread of the story and to intersperse it with our glosses as we proceed.

The construction of the fresh delusion about Gradiva's death during the destruction of Pompeii in the year 79 A.D. was not the only result of the first dream, which we have already analysed. Immediately after it Hanold decided on his journey to Italy, which eventually brought him to Pompeii. But, before that, something else happened to him. As he was leaning out of the window, he thought he saw a figure in the street with the bearing and gait of his Gradiva. In spite of being insufficiently dressed, he hurried after her, but failed to overtake her, and was driven back into the house by the jeers of the passers-by. When he was in his room once more, the song of a canary from its cage in the window of a house opposite stirred up in him a mood in which he too seemed to be a prisoner longing for freedom; and his springtime journey was no sooner decided on than it was carried out.

[65] The author has thrown a particularly clear light on this journey of Hanold's and has allowed him to have a partial insight into his own internal processes. Hanold of course found himself a scientific pretext for his journey, but this did not last long. After all, he was in fact aware that 'the impulse to make this journey had arisen from a feeling he could not name'. A strange restlessness made him dissatisfied with everything he came across, and drove him from Rome to Naples and from there to Pompeii; but even at this last halting place he was still uneasy in his mood. He was annoyed at the folly of the honeymooners, and enraged at the impertinence of the house-flies which inhabit Pompeii's hotels.

1 [The last phrase in this sentence, which, in a slightly different form, has already appeared in the preceding paragraph (p. 48), is an echo of the opening sentence of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 1.]

But at last he could no longer disguise from himself 'that his dissatisfaction could not be caused solely by what was around him but that there was something that sprang from himself as well'. He thought he was overexcited, felt 'that he was discontented because he lacked something, but he had no idea what. And this ill humour followed him about everywhere.' In this frame of mind he was even furious with his mistress – with science. When in the heat of the midday sun he wandered for the first time through Pompeii, 'the whole of his science had not merely abandoned him, but had left him without the slightest desire to find her again. He remembered her only as something in the far distance, and he felt that she had been an old, dried-up, tedious aunt, the dullest and most unwanted creature in the world.' (55.)

And then, while he was in this disagreeable and confused state of feeling, one of the problems attaching to his journey was solved for him – at the moment when he first saw Gradiva stepping through Pompeii. Something 'came into his consciousness for the first time: without being aware himself of the impulse within him, he had come to Italy and had travelled on to Pompeii, without stopping in Rome or Naples, in order to see whether he could find any traces of her. And "traces" literally; for with her peculiar gait she must have left behind an imprint of her toes in the ashes distinct from all the rest.' (58 [p. 12 f. above].)

Since the author has taken so much trouble over describing the journey, it must be worthwhile too to discuss its relation to Hanold's [66]
delusion and its position in the chain of events. The journey was undertaken for reasons [*Motiven*] which its subject did not recognize at first and only admitted to himself later on, reasons which the author describes in so many words as 'unconscious'. This is certainly taken from life. One does not need to be suffering from a delusion in order to behave like this. On the contrary, it is an event of daily occurrence for a person – even a healthy person – to deceive himself over the motives for an action and to become conscious of them only after the event [*nachträglich*], provided only that a conflict between several currents of feeling furnishes the necessary condition for such a confusion. Accordingly, Hanold's journey was from the first calculated to serve the delusion, and was intended to take him to Pompeii, where he could proceed further with his search for Gradiva. It will be recalled that his mind was occupied with that search both before and immediately after the dream, and that the dream itself was simply an answer to the question of Gradiva's whereabouts, though an answer which was stifled by his consciousness. Some power which we do not recognize was, however, also inhibiting

Hemmung [*hemmt*][T] him to begin with from becoming aware of his delusional intention; so that, for the conscious reasons for his journey, he was left only with insufficient pretexts which had to be renewed from place to place. The author presents us with a further puzzle by making the dream, the discovery of the supposed Gradiva in the street, and the decision to undertake the journey as a result of the singing canary succeed one another as a series of chance events without any internal connection with one another.

This obscure region of the story is made intelligible to us by some explanations which we derive from the later remarks of Zoe Bertgang. It was, in fact, the original of Gradiva, Fräulein Zoe herself, whom Hanold saw out of his window walking past in the street (89) and whom he nearly overtook. If this had happened, the information given him by the dream – that she was, in fact, living at the same time and in the same town
[67] as he was – would by a lucky chance have received an irresistible confirmation, which would have brought about the collapse of his internal struggle. But the canary, whose singing sent Hanold off on his distant journey, belonged to Zoe, and its cage stood in her window diagonally across the street from Hanold's house. (135 [p. 23 above].) Hanold, who, according to the girl's accusation, had the gift of 'negative hallucination', who possessed the art of not seeing and not recognizing people who were actually present, must from the first have had an unconscious knowledge of what we learnt only later. The indications of Zoe's proximity (her appearance in the street and her bird's singing so near his window) intensified the effect of the dream, and in this position, so perilous for his resistance to his erotic feelings, he took to flight. His journey was a result of his resistance gathering new strength after the surge forward of his erotic desires in the dream; it was an attempt at flight from the physical presence of the girl he loved. In a practical sense it meant a victory for repression, just as his earlier activity, his 'pedestrian researches' upon women and girls, had meant a victory for erotism. But everywhere in these oscillations in the struggle the compromise character of the outcome was preserved: the journey to Pompeii, which was supposed to lead him away from the living Zoe, led him at least to her surrogate, to Gradiva. The journey, which was undertaken in defiance of the latent dream thoughts, was nevertheless following the path to Pompeii that was pointed out by the manifest content of the dream. Thus at every fresh struggle between erotism and resistance we find the delusion triumphant.

This view of Hanold's journey as a flight from his awakening erotic longing for the girl whom he loved and who was so close to him is the only one which will fit in with the description of his emotional states during his stay in Italy. The repudiation of erotism which dominated him was expressed there in his disgust at the honeymooners. A short dream which he had in his *albergo* in Rome, and which was occasioned by the proximity of a German loving couple, 'Edwin and Angelina', whose [68] evening conversation he could not help hearing through the thin partition wall, throws a retrospective [*nachträglich*] light, as it were, on the erotic drift of his first major dream. In the new dream he was once again in Pompeii and Vesuvius was once again erupting, and it was thus linked to the earlier dream whose effects persisted during the journey. This time, however, among the people imperilled were – not, as on the former occasion, himself and Gradiva but – the Apollo Belvedere and the Capitoline Venus, no doubt by way of an ironical exaltation of the couple in the next room. Apollo lifted Venus up, carried her out, and laid her down on some object in the dark which seemed to be a carriage or cart, since it emitted 'a creaking noise'. Apart from this, the interpretation of the dream calls for no special skill. (31.)

Our author, who, as we have long since realized, never introduces a single idle or unintentional feature into his story, has given us another piece of evidence of the asexual current which dominated Hanold during his journey. As he roamed about for hours in Pompeii, 'strangely enough it never once recurred to his memory that a short time before he had dreamt of being present at the burial of Pompeii in the eruption of 79 A.D.' (47.) It was only when he caught sight of Gradiva that he suddenly remembered the dream and became conscious at the same time of the delusional reason for his puzzling journey. How could this forgetting of the dream, this barrier of repression between the dream and his mental state during the journey, be explained, except by supposing that the journey was undertaken not at the direct inspiration of the dream but as a revolt against it, as an emanation of a mental power that refused to know anything of the secret meaning of the dream?

But, on the other hand, Hanold did not enjoy this victory over his erotism. The suppressed mental impulse remained powerful enough to revenge itself on the suppressing one with discontent and inhibition. His longings turned into restlessness and dissatisfaction, which made his journey seem pointless to him. His insight into his reasons for the jour- [69] ney at the bidding of the delusion was inhibited and his relations with his science, which in such a spot should have stirred all his interest, were

interfered with. So the author shows us his hero after his flight from love in a kind of crisis, in a state of complete confusion and distraction, in a turmoil such as we usually find at the climax of an illness, when neither of the two conflicting powers has any longer a sufficiently superior strength over the other for the margin between them to make it possible to establish a vigorous mental regime. But here the author intervenes helpfully, and smoothes things out by making Gradiva appear at this juncture and undertake the cure of the delusion. By the power he possesses of guiding the people of his creation towards a happy destiny, in spite of all the laws of necessity which he makes them obey, he arranges that the girl, to avoid whom Hanold had fled to Pompeii, shall be transported to that very place. In this way he corrects the folly to which the young man was led by his delusion – the folly of exchanging the home of the living girl whom he loved for the burial place of her imaginary substitute.

With the appearance of Zoe Bertgang as Gradiva, which marks the climax of tension in the story, our interest, too, soon takes a new direction. So far, we have been assisting at the development of a delusion; now we are to witness its cure. And we may ask whether the author has given a purely fanciful account of the course of this cure or whether he has constructed it in accordance with possibilities actually present. Zoe's own words during her conversation with her newly married friend give us a definite right to ascribe to her an intention to bring about the cure. (124 [p. 21 above].) But how did she set about it? When she had got over the indignation aroused in her by his suggestion that she should lie down to sleep again as she had 'then', she returned next day at the same midday hour to the same spot, and proceeded to entice out of Hanold all the secret knowledge her ignorance of which had prevented her from understanding his behaviour the day before. She learnt about his dream, about [70] the sculpture of Gradiva, and about the peculiarity of gait which she herself shared with it. She accepted the role of the ghost awakened to life for a brief hour, a role for which, as she perceived, his delusion had cast her, and, by accepting the flowers of the dead which he had brought without conscious purpose, and by expressing a regret that he had not given her roses, she gently hinted in ambiguous words at the possibility of his taking up a new position. (90 [p. 16].)

This unusually clever girl, then, was determined to win her childhood's friend for her husband, after she had recognized that the young man's love for her was the driving force [*treibende Kraft*] behind the delusion. Our interest in her behaviour, however, will probably yield

for the moment to the surprise which we may feel at the delusion itself. The last form taken by it was that Gradiva, who had been buried in 79 A.D., was now able, as a midday ghost, to exchange words with him for an hour, at the end of which she must sink into the ground or seek her grave once more. This mental cobweb, which was not brushed away either by his perceiving that the apparition was wearing modern shoes or by her ignorance of the ancient languages and her command of German, which was not in existence in her day, certainly seems to justify the author's description of his story as a 'Pompeian phantasy', but it seems also to exclude any possibility of measuring it by the standards of clinical reality.

Nevertheless, on closer consideration this delusion of Hanold's seems to me to lose the greater part of its improbability. The author, indeed, has made himself responsible for one part of it by basing his story on the premise that Zoe was in every detail a duplicate of the relief. We must therefore avoid shifting the improbability of this premise on to its consequence – that Hanold took the girl for Gradiva come to life. Greater value is given to the delusional explanation by the fact that the author has put no rational one at our disposal. Moreover, the author has adduced contributory and mitigating circumstances on behalf of his hero's excesses in the shape of the glare of the *campagna* sunlight and the [71]
intoxicating magic of the wine grown on the slopes of Vesuvius. But the most important of all the explanatory and exculpatory factors remains the ease with which our intellect is prepared to accept something absurd provided it satisfies powerful emotional impulses. It is an astonishing fact, and one that is too generally overlooked, how readily and frequently under these psychological conditions people of even the most powerful intelligence react as though they were feeble-minded; and anyone who is not too conceited may see this happening in himself as often as he pleases. And this is far more so if some of the mental processes concerned are linked with unconscious or repressed motives. In this connection I am happy to quote the words of a philosopher, who writes to me: 'I have been noting down the instances I myself experience of striking mistakes and unthinking actions, for which one finds motives afterwards [*nachträglich*] (in a most unreasonable way). It is an alarming thing, but typical, to find how much folly this brings to light.' It must be remembered, too, that the belief in spirits and ghosts and the return of the dead, which finds so much support in the religions to which we have all been attached, at least in our childhood, is far from having disappeared among educated people, and that many who are sensible in

other respects find it possible to combine spiritualism with reason. A man who has grown rational and sceptical, even, may be ashamed to discover how easily he may for a moment return to a belief in spirits under the combined impact of strong emotion and perplexity. I know of a doctor who had once lost one of his women patients suffering from Graves' disease,[1] and who could not get rid of a faint suspicion that he might perhaps have contributed to the unhappy outcome by a thoughtless prescription. One day, several years later, a girl entered his consulting room, who, in spite of all his efforts, he could not help recognizing as the dead one. He could frame only a single thought: 'So
[72] after all it's true that the dead can come back to life.' His dread did not give way to shame till the girl introduced herself as the sister of the one who had died of the same disease as she herself was suffering from. The victims of Graves' disease, as has often been observed, have a marked facial resemblance to one another; and in this case this typical likeness was reinforced by a family one. The doctor to whom this occurred was, however, none other than myself; so I have a personal reason for not disputing the clinical possibility of Norbert Hanold's temporary delusion that Gradiva had come back to life. The fact, finally, is familiar to every psychiatrist that in severe cases of chronic delusions (in paranoia) the most extreme examples occur of ingeniously elaborated and well-supported absurdities.

After his first meeting with Gradiva, Norbert Hanold had drunk his wine first in one and then in the other of the two restaurants that he knew in Pompeii, while the other visitors were engaged in eating the main meal of the day. 'Of course it never came into his head to think of the nonsensical idea' that he was doing it in order to discover in which of the hotels Gradiva was living and taking her meals. But it is difficult to say what other sense his actions could have had. On the day after their second meeting in the House of Meleager, he had all kinds of strange and apparently unconnected experiences. He found a narrow gap in the wall of the portico, at the point where Gradiva had disappeared. He met a foolish lizard-catcher who addressed him as though he were an acquaintance. He discovered a third hotel, in an out-of-the-way situation, the 'Albergo del Sole', whose proprietor palmed off on him a metal clasp with a green patina as a find from beside the remains of a Pompeian girl. And, lastly, in his own hotel he noticed a newly arrived young couple whom he diagnosed as a brother and sister and whom he found attractive

1 [Exophthalmic goitre.]

[*Sympathie schenkt*]. All these impressions were afterwards woven together into a 'remarkably senseless' dream, which ran as follows:

'Somewhere in the sun Gradiva was sitting, making a snare out of a blade of grass to catch a lizard in, and said: "Please keep quite still. Our [73] lady colleague is right; the method is a really good one and she has made use of it with excellent results."' [p. 19 above.]

He fended off this dream while he was still asleep, with the critical thought that it was utter madness, and cast around in all directions to get free from it. He succeeded in doing so with the help of an invisible bird, which uttered a short laughing call and carried off the lizard in its beak.

Are we to venture on an attempt at interpreting this dream too – that is, at replacing it with the latent thoughts from whose distortion it must have arisen? It is as senseless as only a dream can be expected to be; and this absurdity of dreams is the mainstay of the view which refuses to characterize dreams as completely valid psychical acts and maintains that they arise out of a purposeless excitation [*Erregung*] of the elements of the mind.

We are able to apply to this dream the technique which may be described as the regular procedure for interpreting dreams. It consists in paying no attention to the apparent connections in the manifest dream but in fixing our eyes upon each portion of its content independently, and in looking for its origin in the dreamer's impressions, memories and free associations [*freien Einfällen*][T.][1] Since, however, we cannot question *Einfall* Hanold, we shall have to content ourselves with referring to his impressions, and we may very tentatively put our own associations [*Einfälle*] in place of his.

'Somewhere in the sun Gradiva was sitting, catching lizards and speaking.' What impression of the previous day finds an echo in this part of the dream? Undoubtedly, the encounter with the elderly gentleman, the lizard-catcher, who was thus replaced in the dream by Gradiva. He sat or lay 'on a sun-bathed slope' and he, too, spoke to Hanold. Furthermore, Gradiva's remarks in the dream were copied from this man's remarks: viz. 'The method prescribed by our colleague Eimer is a really good one; I have made use of it many times already with excellent results. [74] Please keep quite still.' [p. 18.] Gradiva used much the same words in the dream, except that 'our colleague Eimer' was replaced by an unnamed 'lady colleague'; moreover, the 'many times' in the zoologist's speech was omitted in the dream and the order of the sentences was somewhat

1 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 92.]

altered. It seems, therefore, that this experience of the previous day was transformed into the dream with the help of a few changes and distortions. Why this particular experience? And what is the meaning of the changes – the replacement of the elderly gentleman by Gradiva and the introduction of the enigmatic 'lady colleague'?

There is a rule in interpreting dreams which runs as follows: 'A speech heard in a dream is always derived from one that has been heard or made by the dreamer in waking life.'[1] This rule seems to have been observed here: Gradiva's speech is only a modification of the old zoologist's speech which Hanold had heard the day before. Another rule in dream interpretation would tell us that when one person is replaced with another or when two people are mixed up together (for instance, by one of them being shown in a situation that is characteristic of the other), it means that the two people are being equated, that there is a similarity between them.[2] If we venture to apply this rule too to our dream, we should arrive at this translation: 'Gradiva catches lizards just like the old man; she is skilled in lizard-catching just as he is.' This result cannot exactly be said to be intelligible as yet; but we have yet another puzzle to solve. To what impression of the previous day are we to relate the 'lady colleague' who in the dream replaces the famous zoologist Eimer? Fortunately we have very little choice here. A 'lady colleague' can only mean another girl – that is to say, the attractive young lady whom Hanold had taken for a sister travelling with her brother. 'She was wearing a red Sor-
[75] rento rose in her dress, the sight of which reminded him of something as he looked across from his corner of the dining room, but he could not think what.' [p. 19 above.] This remark of the author's gives us a right to regard her as the 'lady colleague' in the dream. What Hanold could not recall were, it cannot be doubted, the words spoken by the supposed Gradiva, who had told him, as she asked him for the white flowers of the dead, that in the spring people give happier girls roses [p. 16]. But behind those words there had lain a hint of wooing. So what sort of lizard-catching was it that the happier 'lady colleague' had carried out so successfully?

Next day Hanold came upon the supposed brother and sister in an affectionate embrace, and was thus able to correct his earlier mistake. They were in fact a pair of lovers, and moreover on their honeymoon, as we discovered later when they so unexpectedly interrupted Hanold's third interview with Zoe. If now we are willing to assume that Hanold, though consciously taking them for a brother and sister, had immediately recognized their true relationship (which was unambiguously

1 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 374 ff.]

2 [Ibid., **4**, 285 ff.]

betrayed next day) in his unconscious, Gradiva's speech in the dream acquires a clear meaning. The red rose had become the symbol of a love relation. Hanold understood that the couple were already what he and Gradiva had yet to become; the lizard-catching had come to signify man-catching; and Gradiva's speech meant something like: 'Only let me alone: I know how to win a man just as well as the other girl does.'

But why was it necessary for this penetration of Zoe's intentions to appear in the dream in the form of the old zoologist's speech? Why was Zoe's skill in man-catching represented by the old gentleman's skill in lizard-catching? Well, we can have no difficulty in answering that question. We guessed long ago that the lizard-catcher was none other than Bertgang, the Professor of Zoology and Zoe's father, who, incidentally, must have known Hanold too – which explains how he came to address him as an acquaintance. Let us assume, once again, that in his unconscious Hanold at once recognized the Professor. 'He had a vague notion [76] that he had already had a passing glimpse of the lizard-hunter's face, probably in one of the two hotels.' This, then, is the explanation of the strange disguise under which the intention attributed to Zoe made its appearance: she was the lizard-catcher's daughter and had acquired her skill from him.

The replacement of the lizard-catcher by Gradiva in the content of the dream is accordingly a representation of the relation between the two figures which was known to Hanold in his unconscious; the introduction of the 'lady colleague' instead of 'our colleague Eimer' allowed the dream to express Hanold's realization that she was wooing a man. So far, the dream welded together ('condensed' [*verdichtet*][T], as we say) two *Verdichtung* experiences of the previous day into one situation, in order to bring to expression (in a very obscure way, it is true) two discoveries which were not allowed to become conscious. But we can go further, we can diminish the strangeness of the dream still more and we can demonstrate the influence of his other experiences of the previous day on the form taken by the manifest dream.

We may declare ourselves dissatisfied with the explanation that has hitherto been given of why it was that precisely the scene of the lizard-catching was made into the nucleus of the dream, and we may suspect that still other elements of the dream thoughts were bringing their influence to bear in the emphasis that was laid on the 'lizard' in the manifest dream. Indeed, it may easily have been so. It will be recalled [p. 17 above] that Hanold had discovered a gap in the wall at the point where Gradiva had seemed to vanish – a gap 'which was nevertheless

wide enough to allow a form that was unusually slim' to slip through. This observation led him in the daytime to make an alteration in his delusion – an alteration to the effect that when Gradiva disappeared from his sight she did not sink into the earth but used the gap as a way of reaching her grave. In his unconscious thoughts he may have told himself that he
[77] had now discovered the natural explanation of the girl's surprising disappearance. But must not the idea of slipping through narrow gaps and disappearing in them have recalled the behaviour of lizards? Was not Gradiva herself in this way behaving like an agile little lizard? In our view, then, the discovery of the gap in the wall contributed to determining the choice of the element 'lizard' in the manifest content of the dream. The lizard situation in the dream represented this impression of the previous day as well as the encounter with Zoe's father, the zoologist.

And what if now, growing bold, we were to try to find a representation in the content of the dream of the one experience of the previous day which has not yet been exploited – the discovery of the third inn, the Albergo del Sole? The author has treated this episode at such length and has linked so many things to it that it would surprise us if it alone had made no contribution to the construction of the dream. Hanold went into this inn, which, owing to its out-of-the-way situation and its distance from the railway station, had remained unknown to him, to purchase a bottle of soda water to cool his heated blood. The landlord took the opportunity of displaying his antiquities, and showed him a clasp which he pretended had belonged to the Pompeian girl who had been found in the neighbourhood of the Forum closely embraced by her lover. Hanold, who had never hitherto believed this often-repeated tale, was now compelled by a power unknown to him to believe in the truth of this moving story and in the genuineness of the find; he purchased the brooch and left the inn with his acquisition. As he was going out, he saw, standing in a glass of water in a window, a nodding sprig of asphodel covered with white blossoms, and took the sight of it as a confirmation of the genuineness of his new possession. He now felt a positive conviction that the green clasp had belonged to Gradiva and that she had been the girl who had died in her lover's arms. He quieted the jealousy which thereupon seized him, by deciding that next day he would show the clasp to Gradiva herself and arrive at certainty about his
[78] suspicion. It cannot be denied that this was a curious new piece of delusion; yet are we to suppose that no trace of it was to be found in his dream of the same night?

It will certainly be worthwhile to explain the origin of this addition to the delusion and to look for the fresh piece of unconscious discovery which was replaced by the fresh piece of delusion. The delusion appeared under the influence of the landlord of the 'Sun Hotel' to whom Hanold behaved in such a remarkably credulous fashion that it was almost as though he had been given a hypnotic suggestion by him. The landlord showed him a metal clasp for a garment, represented it as genuine and as having belonged to the girl who had been found buried in the arms of her lover; and Hanold, who was capable of being sufficiently critical to doubt both the truth of the story and the genuineness of the clasp, was at once taken in, and purchased the highly dubious antique. Why he should have behaved in this way is quite incomprehensible, and there is nothing to suggest that the landlord's personality might offer us a solution. But there is yet another riddle about the incident, and two riddles often solve each other. As he was leaving the *albergo* he saw a sprig of asphodel standing in a glass in a window and took it as a confirmation of the genuineness of the metal clasp. How could that have come about? But fortunately this last point is easy to solve. The white flower was no doubt the one which he had given to Gradiva at midday, and it is perfectly true that something was confirmed by the sight of it in the window of the inn. Not, it is true, the genuineness of the clasp, but something else that had already become clear to him when he discovered this *albergo* after having previously overlooked it. Already on the day before he had behaved as though he was searching in the two Pompeii hotels to find the person who appeared to him as Gradiva. And now, since he had so unexpectedly come upon a third one, he must have said to himself in his unconscious: 'So *this* is where she is staying!' And added, as he was going out: 'Yes, that's right! There's the asphodel that I gave her! So that's her window!' This then was the new discovery which was replaced [79]
by the delusion, and which could not become conscious because its underlying postulate that Gradiva was a living person whom he had once known could not become conscious.

But how did the replacement of the new discovery by the delusion take place? What happened, I think, was that the sense of conviction attaching to the discovery was able to persist and was retained, while the discovery itself, which was inadmissible to consciousness, was replaced by another ideational content connected with it by associations of thought. Thus the sense of conviction became attached to a content which was in fact foreign to it and this, in the form of a delusion, won a recognition which did not apply to it. Hanold transferred his conviction

that Gradiva lived in the house to other impressions which he had received in the house; this led to his credulity in regard to the landlord's remarks, the genuineness of the metal clasp and the truth of the anecdote about the discovery of the embracing lovers – but only through his linking what he heard in the house with Gradiva. The jealousy which was already latent in him seized upon this material and the consequence was the delusion (though it contradicted his first dream) that Gradiva was the girl who had died in her lover's arms and that the clasp he had bought had belonged to her.

It will be observed that his conversation with Gradiva and her hint at wooing him (her 'saying it with flowers') had already brought about important changes in Hanold. Traits of masculine desire – components of the libido – had awakened in him, though it is true that they could not yet dispense with the disguise of conscious pretexts. But the problem of the 'bodily nature' of Gradiva, which pursued him all that day [pp. 15 and 17 above], cannot disavow [*verleugnen*][T] its origin in a young man's erotic curiosity about a woman's body, even if it is involved in a scientific question by the conscious insistence on Gradiva's peculiar oscillation between death and life. His jealousy was a further sign of the increasingly active aspect of Hanold's love; he expressed this jealousy at the beginning of their conversation the next day and with the help of a fresh pretext proceeded to touch the girl's body and, as he used to do in the far-off past, to hit her.

Verleugnung

[80]

But it is now time to ask ourselves whether the method of constructing a delusion [*Wahnbildung*] which we have inferred from our author's account is one that is known from other sources, or whether, indeed, it is possible at all. From our medical knowledge we can only reply that it is certainly the correct method, and perhaps the sole method, by which a delusion acquires the unshakeable conviction which is one of its clinical characteristics. If a patient believes in his delusion so firmly, this is not because his faculty of judgement has been overturned and does not arise from what is false in the delusion. On the contrary, there is a grain of truth concealed in every delusion,[1] there is something in it that really deserves belief, and this is the source of the patient's conviction, which is therefore to that extent justified. This true element, however, has long been repressed. If eventually it is able to penetrate into consciousness, this time in a distorted form, the sense of conviction attaching to it is

1 [Freud expressed this view at many points throughout the whole course of his writings. It appears, for instance, in the first edition of *The Psychopathology of Everyday Life* (1901*b*), Chapter XII, Section C (*a*); *RSE*, **6**, 220, and in *Moses and Monotheism* (1939*a*), Essay III, Part II, Section G; ibid., **23**, 117–18.]

over-intensified as though by way of compensation and is now attached to the distorted substitute of the repressed truth, and protects it from any critical attacks. The conviction is displaced, as it were, from the unconscious truth on to the conscious error that is linked to it, and remains fixated there precisely as a result of this displacement. The instance of the formation of a delusion which arose from Hanold's first dream is no more than a similar, though not identical, example of such a displacement. Indeed, the method described here by which conviction arises in the case of a delusion does not differ fundamentally from the method by which a conviction is formed in normal cases, where repression does not come into the picture. We all attach our conviction to thought contents in which truth is combined with error, and let it extend from the former over the latter. It becomes diffused, as it were, from the truth over the error associated with it and protects the latter, though not so unalterably as in the case of a delusion, against deserved criticism. In normal psychology, too, being well connected – 'having influence', so to speak – can take the place of true worth. [81]

I will now return to the dream and bring out a small but not uninteresting feature in it, which forms a connection between two of its provoking causes. Gradiva had drawn a kind of contrast between the white asphodel blossoms and the red rose. Seeing the asphodel again in the window of the Albergo del Sole became an important piece of evidence in support of Hanold's unconscious discovery, which was expressed in the new delusion; and alongside this was the fact that the red rose in the dress of the attractive [*sympathischen*] girl helped Hanold in his unconscious to a correct view of her relation to her companion, so that he was able to make her appear in the dream as the 'lady colleague'.

But where in the manifest content of the dream, it will be asked, do we find anything to indicate and replace the discovery for which, as we have seen, Hanold's new delusion was a substitute – the discovery that Gradiva was staying with her father in the third, concealed Pompeii hotel, the Albergo del Sole? Nevertheless, it is all there in the dream, and not even very much distorted, and I merely hesitate to point to it because I know that even those of my readers who have followed me patiently so far will begin to rebel strongly against my attempts at interpretation. Hanold's discovery, I repeat, is fully announced in the dream, but so cleverly concealed that it is bound to be overlooked. It is hidden behind a play upon words, an ambiguity. 'Somewhere in the sun Gradiva was

sitting.' We have quite correctly related this to the spot where Hanold
[82] met her father, the zoologist. But could it not also mean in the 'Sun' – that is, Gradiva is staying in the Albergo del Sole, the Sun Hotel? And was not the 'somewhere', which had no bearing on the encounter with her father, made to sound so hypocritically indefinite precisely because it introduced a definite piece of information about the place where Gradiva was staying? From my experience elsewhere of real dreams, I myself am perfectly certain that this is how the ambiguity is to be understood. But I should not in fact have ventured to present this piece of interpretative work to my readers if the author had not at this point lent me his powerful assistance. He puts the very same play upon words into the girl's mouth when next day she saw the metal clasp: 'Did you find it in the sun, perhaps, which produces things of this kind?' [p. 20 above.] And since Hanold failed to understand what she had said, she explained that she meant the Sun Hotel, which they call 'Sole' here, and where she had already seen the supposititious antique.

And now let us make a bold attempt at replacing Hanold's 'remarkably senseless' dream with the unconscious thoughts that lay behind it and were as unlike it as possible. They ran, perhaps, as follows: 'She is staying in the "Sun" with her father. Why is she playing this game with me? Does she want to make fun of me? Or can it possibly be that she loves me and wants to have me as her husband?' – And no doubt while he was still asleep there came an answer dismissing this last possibility as 'the merest madness', a comment which was ostensibly directed against the whole manifest dream.

Critical readers will now justly enquire about the origin of the interpolation (for which I have so far given no grounds) of the reference to being ridiculed by Gradiva. The answer to this is given in *The Interpretation of Dreams*, which explains that if ridicule, derision or embittered contradiction occurs in the dream thoughts, this is expressed by the manifest dream being given a senseless form, by absurdity in the
[83] dream.[1] This absurdity does not mean, therefore, that there is any paralysis of psychical activity: it is a method of representation employed by the dream-work. As always happens at specially difficult points, the author once more comes to our help here. The senseless dream had a short epilogue, in which a bird uttered a laughing call and carried the lizard away in its beak. But Hanold had heard a similar laughing call after Gradiva's disappearance [p. 17 above]. It had, in fact, come from Zoe, who with this laugh was shaking off the gloomy seriousness of her underworld role. Gradiva had really laughed at him. But the dream image of

1 [*The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 397.]

the bird carrying off the lizard may have been a recollection of the earlier dream, in which the Apollo Belvedere carried off the Capitoline Venus [p. 53 above].

There may still be some readers who feel that the translation of the situation of lizard-catching by the idea of wooing has not been sufficiently well established. Some further support for it may be afforded by the consideration that Zoe in her conversation with her newly married friend admitted precisely what Hanold's thoughts about her suspected – when she told her she had felt sure that she would 'dig out' something interesting in Pompeii. Here she was trespassing into the field of archaeology, just as he had trespassed, with his simile of lizard-catching, into the field of zoology; it was as though they were struggling towards each other and each were trying to assume the other's character.

Here then we seem to have finished off the interpretation of this second dream as well. Both of them have been made intelligible to us on the presupposition that a dreamer knows in his unconscious thoughts all that he has forgotten in his conscious ones, and that in the former he judges correctly what in the latter he misunderstands in a delusion. In the course of our arguments we have no doubt been obliged to make some assertions which have seemed strange to the reader because of their unfamiliarity; and we have probably often roused a suspicion that what we pretended was the author's meaning was, in fact, only our own. I am anxious to do all I can to dissipate this suspicion, and for that reason I [84] will gladly enter into more detail over one of the most delicate points – I mean the use of ambiguous words and phrases, such as: 'Somewhere in the Sun Gradiva was sitting.'

Anyone who reads *Gradiva* must be struck by the frequency with which the author puts ambiguous remarks into the mouths of his two principal characters. In Hanold's case these remarks are intended by him unambiguously and it is only the heroine, Gradiva, who is struck by their second meaning. Thus, for instance, when in reply to her first answer he exclaimed, 'I knew your voice sounded like that' [p. 14], Zoe, who was still in ignorance, could not but ask how that could be, since he had not heard her speak before. In their second conversation the girl was for a moment thrown into doubt about his delusion, when he told her that he had recognized her at once [p. 16]. She could not help taking these words in the sense (correct so far as his unconscious was concerned) of being a recognition that their acquaintance went back to their childhood; whereas he, of course, knew nothing of this implication of his

remark and explained it only by reference to his dominant delusion. On the other hand, the remarks made by the girl, whose personality shows the most lucid clarity of mind in contrast to Hanold's delusion, exhibit an *intentional* ambiguity. One of their meanings chimes in with Hanold's delusion, so as to be able to penetrate into his conscious understanding, but the other rises above the delusion and gives us as a rule its translation into the unconscious truth for which it stands. It is a triumph of ingenuity and wit to be able to express the delusion and the truth in the same turn of words.

Zoe's speech in which she explains the situation to her friend and at the same time succeeds in getting rid of the interrupter [p. 21 above] is full of ambiguities of this kind. It is in reality a speech made by the author and aimed more at the reader than at Zoe's newly married 'colleague'. In her conversations with Hanold the ambiguity is usually effected by Zoe's
[85] using the same symbolism that we found in Hanold's first dream – the equation of repression and burial, and of Pompeii and childhood. Thus she is able in her speeches on the one hand to remain in the role for which Hanold's delusion has cast her, and on the other hand to make contact with the real circumstances and awaken an understanding of them in Hanold's unconscious.

'I have long grown used to being dead.' (90 [p. 16].) 'To me it is right that you should give the flower of forgetfulness.' (Ibid.) In these sentences there was a faint foretaste of the reproaches which broke out clearly enough later on in her final lecture to him, in which she compared him to an Archaeopteryx [p. 25]. 'The fact of someone having to die so as to come alive; but no doubt that must be so for archaeologists.' (141 [p. 28].) She made this last remark retrospectively [*nachträglich*], after the delusion had been cleared up, as though to give a key to her ambiguous speeches. But she made her neatest use of her symbolism when she asked: 'I feel as though we had shared a meal like this once before, two thousand years ago; can't you remember?' (118 [p. 20].) Here the substitution of the historical past for childhood and the effort to awaken the memory of the latter are quite unmistakable.

But whence comes this striking preference for ambiguous speeches in *Gradiva*? It is no chance event, so it seems to us, but a necessary consequence of the premises of the story. It is nothing other than a counterpart to the twofold determination of symptoms, insofar as speeches are themselves symptoms and, like them, arise from compromises between the conscious and the unconscious. It is simply that this double origin is more easily noticed in speeches than, for instance, in actions.

And when, as is often made possible by the malleable nature of the material of speech, each of the two intentions lying behind the speech can be successfully expressed in the same turn of words, we have before us what we call an 'ambiguity'.

In the course of the psychotherapeutic treatment of a delusion or of an analogous disorder, ambiguous speeches of this kind are often produced by the patient as new symptoms of the briefest duration; and it can [86]
happen that the doctor finds himself too in the position of making use of them. In that way it not infrequently happens that with the meaning that is intended for the patient's conscious he stirs up an understanding of the meaning that applies to his unconscious. I know from experience that the part thus played by ambiguity is apt to raise the greatest objection in the uninitiated and to give rise to the greatest misunderstandings. But in any case our author was right in giving a place in his creation to a picture of this characteristic feature of what takes place in the formation of dreams and delusions.

IV

[87] The emergence of Zoe as a physician, as I have already remarked, arouses a new interest in us. We shall be anxious to learn whether a cure of the kind she performed upon Hanold is conceivable or even possible, and whether the author has taken as correct a view of the conditions for the disappearance of a delusion as he has of those for its genesis.

We shall unquestionably be met at this point with an opinion which denies that the case presented by the author possesses any such general interest and disputes the existence of any problem requiring solution. Hanold, it will be said, had no alternative but to abandon his delusion, after its subject, the supposed 'Gradiva' herself, had shown him that all his hypotheses were incorrect and after she had given him the most natural explanations of everything puzzling – for instance, of how it was that she had known his name. This would be the logical end of the matter; but since the girl had incidentally revealed her love to him, the author, no doubt to the satisfaction of his female readers, arranged that his story, a not uninteresting one otherwise, should have the usual happy ending in marriage. It would have been more consistent and equally possible, the argument will proceed, if the young scientist, after his error had been pointed out, had taken his leave of the lady with polite thanks and given as the reason for refusing her love the fact that he was able to feel an intense interest in antique women made of bronze or marble, and in their originals if they were accessible to contact, but that he did not know what to do with contemporary girls of flesh and blood. The author, in short, had quite arbitrarily tacked a love story on to his archaeological phantasy.

In rejecting this view [*Auffassung*] as an impossible one, we observe in the first place that the beginnings of a change in Hanold were not shown only in his abandoning his delusion. Simultaneously, and indeed before
[88] his delusion was cleared up, an unmistakable craving for love awakened in him, which found its outcome, naturally as it were, in his courting the girl who had freed him from his delusion. We have already laid emphasis on the pretexts and disguises under which his curiosity about her 'bodily nature', his jealousy and his brutal masculine drive to mastery were expressed in the midst of his delusion, after his repressed erotic desire had led to his first dream. As further evidence of this we may recall that on the evening after his second interview with Gradiva a live woman

for the first time struck him as attractive [*Sympathische*], though he still made a concession to his earlier horror of honeymooning couples by not recognizing her as being newly married. Next morning, however, he was a chance witness to an exchange of endearments between the girl and her supposed brother, and he withdrew with a sense of awe as though he had interrupted some sacred act [p. 20 above]. His derision of 'Edwin and Angelina' was forgotten, and he had acquired a sense of respect for the erotic side of life.

Thus the author has drawn the closest link between the clearing up of the delusion and the outbreak of a craving for love, and he has paved the way for the inevitable outcome in a courtship. He knows the essential nature of the delusion better than his critics: he knows that a component of loving desire had combined with a component of resistance to it in bringing about the delusion, and he makes the girl who undertakes the cure sensitive to the element in Hanold's delusion which is agreeable to her. It was only this knowledge which could decide her to devote herself to the treatment; it was only the certainty of being loved by him that could induce her to admit her love to him. The treatment consisted in giving him back from outside the repressed memories which he could not set free from inside; but it would have had no effect if in the course of it the therapist had not taken his feelings into account and if her ultimate translation [*Übersetzung*] of the delusion had not been: 'Look, all this only means that you love me.'

The procedure which the author makes his Zoe adopt for curing her childhood friend's delusion shows a far-reaching similarity – no, a complete agreement in its essence – with a therapeutic method which was introduced into medical practice in 1895 by Dr Josef Breuer and myself, and to the perfecting of which I have since then devoted myself. This method of treatment, to which Breuer first gave the name of 'cathartic' but which I prefer to describe as 'psychoanalytic', consists, as applied to patients suffering from disorders analogous to Hanold's delusion, in bringing to their consciousness, to some extent forcibly, the unconscious whose repression led to their falling ill – exactly as Gradiva did with the repressed memories of their childhood relations. Gradiva, it is true, could carry out this task more easily than a doctor: in several respects she was in what may be described as an ideal position for it. The doctor, who has no pre-existing knowledge of his patient and possesses no conscious memory of what is unconsciously at work in him, must call a complicated technique to his help in order to make up for this disadvantage. He must learn how to infer with great certainty from the [89]

conscious associations and communications of the patient what is repressed in him, how to discover his unconscious as it betrays itself behind his conscious words and acts. He then brings about something like what Norbert Hanold grasped at the end of the story when he translated back the name 'Gradiva' into 'Bertgang' [p. 29 above]. The disorder vanishes while being traced back to its origin; analysis, too, brings simultaneous cure.

But the similarity between Gradiva's procedure and the analytic method of psychotherapy is not limited to these two points – the making conscious of what has been repressed and the coinciding of explanation with cure. It also extends to what turns out to be the essence of the whole change – to the awakening of feelings. Every disorder analogous to Hanold's delusion, what in scientific terms we are in the habit of calling 'psychoneuroses', has as its precondition the repression of a portion of drive activity, or, as we can safely say, of the sexual drive. At every attempt to introduce the unconscious and repressed causes of the illness
[90] into consciousness, the drive component concerned is necessarily aroused to a renewed struggle with the repressing powers, only to come to terms with them in the final outcome, often to the accompaniment of violent manifestations of reaction. The process of cure is accomplished in a relapse into love, if we combine all the many components of the sexual drive under the term 'love'; and such a relapse is indispensable, for the symptoms on account of which the treatment has been undertaken are nothing other than precipitates of earlier struggles connected with repression or the return of the repressed, and they can only be resolved and washed away by a fresh high tide of the same passions. Every psychoanalytic treatment is an attempt at liberating repressed love which has found a meagre outlet in the compromise of a symptom. Indeed, the agreement between such treatments and the process of cure described by the author of *Gradiva* reaches its climax in the further fact that in analytic psychotherapy too the reawakened passion, whether it is love or hate, invariably chooses as its object the figure of the doctor.

It is here that the differences begin, which made the case of Gradiva an ideal one which medical technique cannot attain. Gradiva was able to return the love which was making its way from the unconscious into consciousness, but the doctor cannot. Gradiva had herself been the object of the earlier, repressed love; her figure at once offered the liberated current of love a desirable aim. The doctor has been a stranger, and must endeavour to become a stranger once more after the cure; he is often at a loss what advice to give the patients he has cured as to how in

real life they can use their recovered capacity to love. To indicate the expedients and substitutes of which the doctor therefore makes use to help him to approximate with more or less success to the model of a cure by love which has been shown us by our author – all this would take us much too far away from the task before us.

And now for the final question, whose answer we have already evaded more than once. [Cf. pp. 33 f. and 42 above.] Our views on repression, on [91] the genesis of delusions and allied disorders, on the formation and solution of dreams, on the part played by erotic life, and on the method by which such disorders are cured, are far from being the common property of science, let alone the assured possession of educated people. If the insight which has enabled the author to construct his 'phantasy' in such a way that we have been able to dissect it like a real case history is in the nature of knowledge, we should be curious to learn what were the sources of that knowledge. One of our circle – the one who, as I said at the beginning, was interested in the dreams in *Gradiva* and their possible interpretation [cf. footnote, p. 7] – approached the author with the direct question whether he knew anything of such scientific theories as these. The author replied, as was to be expected, in the negative, and, indeed, somewhat brusquely.[1] His imagination, he said, had inspired *Gradiva*, and he had enjoyed it; if there was anyone whom it did not please, let him simply leave it alone. He had no suspicion of how greatly it had in fact pleased his readers.

It is quite possible that the author's disavowal [*Ablehnung*] does not stop at this. He may perhaps altogether deny any knowledge of the rules which we have shown that he has followed, and he may repudiate all the purposes we have recognized in his work. I do not regard this as improbable; but if it is so, there are only two possible explanations. It may be that we have produced a complete caricature of an interpretation by introducing into an innocent work of art purposes of which its creator had no notion, and by so doing have shown once more how easy it is to find what one is looking for and what is occupying one's own mind – a possibility of which the strangest examples are to be found in the history of literature. Let every reader now make up his mind whether he is able to accept this explanation. We ourselves, of course, hold to the other view, the remaining alternative. Our opinion is that the author need have known nothing of these rules and purposes, so that he could disavow them in good faith, but that nevertheless we have not discovered [92]

1 [See, however, the Editors' Note, p. 4 above.]

anything in his work that is not already in it. We probably draw from the same source and work upon the same object, each of us by another method. And the agreement of our results seems to guarantee that we have both worked correctly. Our procedure consists in the conscious observation of abnormal mental processes in other people so as to be able to elicit and announce their laws. The author no doubt proceeds differently. He directs his attention to the unconscious in his own mind, he listens to its possible developments and lends them artistic expression instead of suppressing them by conscious criticism. Thus he experiences from himself what we learn from others – the laws which the activities of this unconscious must obey. But he need not state these laws, nor even be clearly aware of them; as a result of the tolerance of his intelligence, they are incorporated within his creations. We discover these laws by analysing his writings just as we find them from cases of real illness; but the conclusion seems inescapable that either both of us, the writer and the doctor, have misunderstood the unconscious in the same way, or we have both understood it correctly. This conclusion is of great value to us, and it is on its account that it has been worthwhile to investigate by the methods of medical psychoanalysis the way in which the formation and the cure of the delusions as well as the dreams are represented in Jensen's *Gradiva*.

We would seem to have reached the end. But an attentive reader might remind us that at the beginning [p. 5 above] we threw out an assertion that dreams are wishes represented as fulfilled and that we gave no proof of this. Well, is our reply, what we have described in these pages might show how little justification there is for trying to cover the explanations we have to give of dreams with the single formula that dreams are wish fulfilments. Nevertheless, the assertion stands and can easily be proved too for the dreams in *Gradiva*. The latent dream thoughts – we know
[93] now what is meant by them – may be of the most various kinds; in *Gradiva* they are 'day's residues', thoughts that have been left over unnoticed and undealt with from the mental activities of waking life. But in order for a dream to develop out of them, the cooperation of a wish (usually an unconscious one) is required; this contributes the driving force [*Triebkraft*] for constructing the dream, while the day's residues provide the material. In Norbert Hanold's first dream two wishes competed with each other in making the dream; one of them was actually admissible to consciousness, while the other belonged to the unconscious and operated from out of repression. The first was a wish,

understandable in any archaeologist, to have been present as an eyewitness at the catastrophe in the year 79 A.D. What sacrifice would an archaeologist think too great if this wish could be realized in any way other than in a dream! The other wish, the other constructor of the dream, was of an erotic nature: it might be crudely and also incompletely stated as a wish to be there when the girl he loved lay down to sleep. This was the wish the rejection of which caused the dream to become an anxiety dream. The wishes that drove [*treibenden*] the second dream are perhaps less conspicuous; but if we recall its translation we shall not hesitate to describe them too as erotic. The wish to be taken captive by the girl he loved, to fall in with her wishes and to be subfected to her – for so we may construe the wish behind the situation of the lizard-catching – was in fact of a passive, masochistic character. Next day the dreamer hit the girl, as though he was dominated by the contrary erotic current . . . But we must stop here, or we may really forget that Hanold and Gradiva are only creatures of their author's mind.

POSTSCRIPT TO THE SECOND EDITION (1912)

[94] In the five years that have passed since this study was completed, psychoanalytic research has summoned up the courage to approach the creations of imaginative writers with yet another purpose in view. It no longer merely seeks in them confirmations of the findings it has made from unpoetic, neurotic human beings; it also demands to know the material of impressions and memories from which the author has built the work, and the methods and processes by which he has converted this material into a work of art. It has turned out that these questions can be most easily answered in the case of writers who (like our Wilhelm Jensen, who died in 1911) were in the habit of giving themselves over to their imagination in a simple-minded joy in creating. Soon after the publication of my analytic examination of *Gradiva* I attempted to interest the elderly author in these new tasks of psychoanalytic research. But he
Versagung refused [*versagte*][T] his cooperation.

A friend of mine[1] has since then drawn my attention to two other of the author's short stories, which might stand in a genetic [*genetischer*][T] relation to *Gradiva*, as preliminary studies or earlier attempts at a satisfactory poetical solution to the same problem in the psychology of love. The first of these stories, 'Der rote Schirm',[2] recalls *Gradiva* by the recurrence in it of a number of small motifs, such as white flowers of the dead, a forgotten object (Gradiva's sketch-book), and a significant small animal (the butterfly and the lizard in *Gradiva*), but more especially by the repetition of the main situation – the apparition in the midday glare of a summer's day of a girl who had died (or was believed to have died).
[95] In 'Der rote Schirm' the scene of the apparition is a ruined castle, just as are the ruins of the excavated Pompeii in *Gradiva*. The other story, 'Im gotischen Hause',[3] shows no such resemblances either to *Gradiva* or to 'Der rote Schirm' in its manifest content. But the fact that it was given

1 [This was Jung.]

2 ['The Red Parasol.']

3 ['In the Gothic House.']

an external unity with the latter story by being published with it under a common title[1] points unmistakably to their having a closely related latent meaning. It is easy to see that all three stories treat of the same theme: the development of a love (in 'Der rote Schirm' the inhibition of a love) as an after-effect of an intimate association in childhood of a brother-and-sister kind. I gather further from a review by Eva, Countess Baudissin (in the Vienna daily paper *Die Zeit* of February 11, 1912) that Jensen's last novel *Fremdlinge unter den Menschen*,[2] which contains much material from the author's own childhood, describes the history of a man who 'sees a sister in the woman he loves'. In neither of the two earlier stories is there a trace of the main motif of *Gradiva*: the girl's peculiarly charming gait with the nearly perpendicular posture of her foot.[3]

The relief of the girl who steps along in this way, which Jensen describes as being Roman, and to which he gives the name of 'Gradiva', is in fact derived from the zenith of Greek art. It is in the Museo Chiaramonti in the Vatican (No. 644), and has been restored and interpreted by Hauser [1903]. By the combination of 'Gradiva' and some other fragments, in Florence and Munich, two reliefs were obtained, each representing three figures, who seem to be identified as the Horae, the goddesses of vegetation, and [the Agraulids,] the deities of the fertilizing dew who are allied to them.[4]

1 *Übermächte* [*Superior Powers*]. Two short stories by Wilhelm Jensen, Berlin, Emil Felber, 1892.

2 [*Strangers among Men*, Dresden, C. Reissner, 1911.]

3 [Some further remarks on these stories and on Jensen were made by Freud in a discussion on a paper by Max Graf at a meeting of the Vienna Psychoanalytical Society on December 11, 1907. See the *Minutes*, **1** (1962).]

4 [Hauser (loc. cit.) regards them as Roman copies of Greek originals of the latter part of the fourth century B.C. The 'Gradiva' relief is now (2024) in the Museo Chiaramonti and is numbered 1284.]

Freud's writing desk at Berggasse 19

Freud's writing desk at Berggasse 19

Showing part of Freud's collection of ancient figurines. He frequently drew analogies (as on p. 31 of this volume) between the work of archaeological excavation and that of psychoanalysis.

1959 *SE*, **9**, 103–14. (Tr. J. Strachey, based on the 1924 translation.)

The present translation is a revised and corrected reprint of the *SE* version.

This was originally delivered in June, 1906, as a lecture, at the request of Professor Löffler (Professor of Jurisprudence in Vienna), before his seminar at the university. There is some confusion as to the date of publication. The number of the periodical in which it appeared is stated on its front page to have been issued on 'December 21, 1907'. This, however, is certainly a misprint for '1906', since the following numbers are dated 'March 6, 1907' and 'April 29, 1907'.

The lecture is of some historical interest, since it contains Freud's first published mention of the name of Jung (p. 84 below).[1] Freud had begun to correspond with [100] Jung only a couple of months before he delivered this lecture, though their first meeting did not take place till the following February.

This work gives evidence of the immediate impact of Jung. Its whole purpose seemed to be to introduce the Zürich association experiments and the theory of complexes to Vienna students. The Zürich studies had begun to appear in periodical form two years earlier (Jung & Riklin, 1904) and Jung had himself published two or three studies on the application of his procedure to legal evidence only a few months before Freud gave his lecture (e.g. Jung, 1906, referred to on p. 84 below).

1 It happens that Adler's name, too, makes its first appearance here (p. 85 below).

At a later date, after Jung's secession, Freud, in his notes 'On the History of the Psychoanalytic Movement' (1914*d*), discounted the importance both of the association experiments and of the theory of complexes (*RSE*, **14**, 23–5). And even here his approval of them has a background of implied criticism. He is at pains to show that the Zürich findings are, in fact, only special applications of underlying psychoanalytic principles. And in the penultimate paragraph he indicates the danger of drawing too hasty conclusions from the results of association tests.

Since this is the debut in Freud's published writings of the Zürich term 'complex', a few remarks on the subject may be appropriate here. Association experiments were first systematically made by Wundt, and later introduced into psychiatry by Kraepelin and, more especially, Aschaffenburg. Under the direction of Bleuler, then at the head of the Burghölzli public asylum in Zürich, and of Jung, his principal assistant, a series of similar experiments were carried out, the findings of which were published from 1904 onwards. They were later collected into two volumes (1906, 1909) under Jung's editorship. Apart from a fresh classification of the forms taken by the verbal reactions to stimulus words, the Zürich findings were chiefly of interest for the stress they laid on the importance of one particular factor in influencing the
[101] reactions. This factor was described in the first of these publications (Jung & Riklin, 1904) as an 'emotionally coloured ideational complex'. The authors explain this in a footnote (ibid., 57) as meaning 'the totality of ideas relating to a particular emotionally coloured event'; and they add that in what follows they will use the single word 'complex' in this sense. It will be noticed that there is no direct reference in this to the ideas in question being unconscious or repressed, and it is clear from what follows (e.g. ibid., 74) that a 'complex' may or may not consist of repressed material. Except for its convenience as an abbreviation there seems to be no particular virtue in the word 'complex' as thus defined; and it is unlikely that this was in fact its first introduction in this sense. As we learn from Ernest Jones (1955, 34 and 127), Ziehen, the well-known Berlin psychiatrist, claimed to have originated its use.[1] But, in fact, it occurs three times, with what appears to be exactly the same meaning, in an early work of Freud's own – the case of Frau Emmy von N. in the *Studies on Hysteria* (1895*d*), *RSE*, **2**, 62 *n*.;[2] while Breuer, in the same work (ibid., 205–6) seems actually to lay more stress than these early Zürich definitions on the factor of unconsciousness, when he writes that 'ideas that are aroused but do not enter consciousness . . . sometimes . . . accumulate and form complexes – mental strata withdrawn from consciousness'. When at a later period the term became a catchword not only in psychology but in popular usage, the feature of the group of ideas concerned being
[102] 'withdrawn from consciousness' – that is to say 'repressed' – came to form an essential part of the word's connotation.

1 Ziehen was a bitter opponent of psychoanalysis, though it is an odd fact that it was in a periodical under his joint editorship that both *The Psychopathology of Everyday Life* (1901*b*) and the 'Dora' case history (1905*e*) first saw the light.

2 In the early days Freud very frequently used the terms 'groups of ideas' or 'psychical groups' in what seems to be a very similar sense. See, for instance, *Studies on Hysteria* (1895*d*), *RSE*, **2**, 11, 79, 147, and Draft G (dating probably from January, 1895) in the Fliess correspondence (Freud, 1950*a*; ibid., **1**, 229). In the earlier editions of *The Psychopathology of Everyday Life* (1901*b*) we find (Chapter VI, A) 'circles of thoughts [*Gedankenkreisen*]'. In the 1907 edition, and in all subsequent ones, this was changed into 'complexes'. The word 'complexes' (but perhaps not derived from Jung) appears in *Jokes* (1905*c*), ibid., **8**, 89 – i.e. after the Jung & Riklin paper of 1904.

Freud's later contacts with jurisprudence were few and far between. Leaving aside his statements on contraception, homosexuality and marriage law reform (1905*g*, 1905*h*, 1910–11*a*), the third of his studies on character-types (1916*d*) has a direct bearing on the psychology of crime. And on two later occasions he made reports in connection with criminal cases. In one of these (1930*i*) he was asked to comment on an expert opinion given in a murder case, and in the other he wrote a memorandum for the defence in a case of assault (Jones, 1957, 93). This memorandum (written in 1922) is not extant. In both these instances he wrote to deprecate any half-baked application of psychoanalytic theories in legal proceedings.

PSYCHOANALYSIS AND THE ESTABLISHMENT OF THE FACTS IN LEGAL PROCEEDINGS

Gentlemen, there is a growing recognition of the untrustworthiness of [103]
statements made by witnesses, on which, nevertheless, so many convictions are based today in court cases; and this has quickened in all of you, future judges and defending counsel, an interest in a new method of investigation, the aim of which is to compel the accused person himself to establish his own guilt or innocence by objective signs. This method consists in a psychological experiment and is based on psychological research. It is closely connected with certain views which have only recently come to the notice of medical psychology. I understand that you are already engaged in testing the use and possibilities of this new method by means of what might be called 'dummy exercises', and I have gladly accepted the invitation of your President, Professor Löffler, to explain to you more fully the relation of this method to psychology.

You are all acquainted with the game played at parties or among children in which a word is called out at random and someone has to add a second word, which, when it is added to the first, results in a compound word being formed. For instance, 'steam' – 'ship', making 'steam-ship'. The 'association experiment' [*Assoziationsversuch*] introduced into psychology by the school of Wundt is nothing more than a modification of this children's game, merely omitting one rule of the game.

The experiment is as follows: a word (termed the 'stimulus word') is called out to the subject and he replies as quickly as possible with some other word that occurs [*einfällt*][T] to him (the so-called 'reaction'), his *Einfall*
choice of this reaction not being restricted by anything. The points to be observed are the *time* required for the reaction and the *relation* – which [104]
may be of many different kinds – between the stimulus word and the reaction word. It cannot be claimed that in the first instance very much came of these experiments. This was to be expected, however, since they were carried out without framing any definite question and without any

guiding idea [*Idee*] which could be brought to bear on the results. They only became significant and fruitful when Bleuler in Zürich and his pupils, especially Jung, began to turn their attention to these 'association experiments'. The experiments which they carried out acquired their value from the fact that they assumed that the reaction to the stimulus word could not be a chance one but must be determined by an ideational
Vorstellung content [*Vorstellungsinhalt*][T] present in the mind of the reacting subject.

It has become customary to speak of an ideational content of this kind, which is able to influence the reaction to the stimulus word, as a 'complex'.[1] This influence works either by the stimulus word touching the complex directly or by the complex succeeding in making a connection with the word through intermediate links. Such a determination of the reaction is a very remarkable fact; you will find undisguised astonishment expressed at it in the literature of the subject. But its truth admits of no doubt. For as a rule you can lay bare the particular complex at work, and so explain reactions which could not otherwise be understood, by asking the subject himself to give the reasons for his reaction. Examples like those given by Jung (1906, 6 and 8–9) are well calculated to make us doubt the occurrence of chance or of what is alleged to be
Seele arbitrary in mental events [*seelischen Geschehen*][T].

Let us now glance at the earlier history of this view of Bleuler and Jung that the reaction of the subject under examination is determined by his complex. In 1901 I published a work[2] in which I demonstrated that a whole number of actions which were held to be unmotivated are
[105] on the contrary strictly determined, and to that extent I contributed towards restricting the arbitrary factor in psychology. I took as examples slight failures of memory, slips of the tongue or pen, and the mislaying of objects [*Vergessens*, *Versprechens*, *Verschreibens*, *Verlegens*][T]. I showed that when someone makes a slip of the tongue it is not
Vergessen chance, nor simply difficulty in articulation or similarity in sound, that is responsible, but that in every case a disturbing ideational content – a complex – can be brought to light which has altered the sense of the intended speech under the apparent form of a slip of the tongue. Furthermore, I examined the small actions which are performed apparently by chance and without any purpose – habits of playing or fiddling with things, and so on – and revealed them as 'symptomatic

1 [This is probably Freud's first published use of the word in this specific sense. See Editors' Note above, p. 80 ff.]

2 *The Psychopathology of Everyday Life* [(1901*b*), *RSE*, **6**].

actions' linked with a hidden meaning and intended to give unobtrusive expression to it. I found, moreover, that not even a first name[1] can occur arbitrarily to the mind, without having been determined by some powerful ideational complex. Even arithmetical numbers that one believes one has chosen at random can be traced to the influence of a hidden complex of this kind. A few years after this, a colleague of mine, Dr Alfred Adler,[2] was able to substantiate this most astonishing of my assertions by some very striking examples (Adler, 1905).[3] Once one has accustomed oneself to this view of determinism in psychical life, one is justified in inferring from the findings in the psychopathology of everyday life that the ideas which occur to the subject in an association experiment may not be arbitrary either, but determined by an ideational content that is operative in him.

And now, gentlemen, let us return to the association experiment. In [106]
the kind of experiment we have referred to so far, it was the person under examination who explained to us the origin of his reactions, and the experiments, if they are subject to this condition, will be of no interest from the point of view of judicial procedure. But how would it be if we were to make a change in our planning of the experiment? Might we not proceed as one does in solving an equation which involves several quantities, where one can take any one of them as the starting point – by making *either* the *a or* the *b* into the *x* we are looking for? Up to now in our experiments it has been the *complex* that has been unknown to us. We have used stimulus words selected at random, and the subject under examination has revealed to us the complex brought to expression by those stimulus words. But let us now set about it differently. Let us take a complex that is *known* to us and ourselves react to it with stimulus words deliberately chosen; and let us then transfer the *x* to the person who is reacting. Will it then be possible to decide, from the way in which he reacts, whether the complex we have chosen is also present in him? You can see that this way of planning the experiment corresponds exactly to the method adopted by an examining magistrate who is trying to find out whether something of which he is aware is also known to the accused as an agent. Wertheimer and Klein, two pupils of Hans Gross, the Professor of Criminal Law in Prague, seem to have been the first to

1 [It seems likely that Freud was thinking of his choice of the name 'Dora', discussed by him in the original edition of *The Psychopathology of Everyday Life* (1901*b*), Chapter XII (A), Example 1, to which he added a paragraph in the edition of 1907.]

2 [This was Freud's earliest published mention of Adler.]

3 [One of these was quoted by Freud in *The Psychopathology of Everyday Life* from the 1907 edition onwards. (Chapter XII (A), Example 3.)]

adopt this change, which is of such importance for your purposes, in the planning of the experiment.[1]

You already know from your own experiments that, in this question of the subject's reactions, several points are to be taken into account in deciding whether he possesses the complex to which *you* are reacting with your stimulus words. I will enumerate these points for you one by
[107] one. (1) The *content* of the reaction may be unusual, which requires explanation. (2) The *reaction time* may be prolonged; for it appears that stimulus words which have touched the complex produce a reaction only after a considerable delay (a delay which may be several times as long as the ordinary reaction time). (3) There may be a mistake in *reproducing* the reaction. You know the remarkable fact that is meant by this. If the subject has been given an association experiment consisting of a comparatively long list of stimulus words, and if a short time after the end of the experiment the stimulus words are once more presented to him, he will produce the same reactions as on the first occasion except when the stimulus word has touched a complex, in which case he is very liable to replace his first reaction with another one. (4) The phenomenon of *perseveration* (or it might be better to use the term 'after-effect' [*Nachwirkung*]) may occur. When a complex is aroused by a stimulus word which touches it – by a 'critical' stimulus word – it often happens that the effects of this (for instance, a prolonging of the reaction time) persist and alter the subject's reactions to the next, noncritical words as well. When all or several of these indications are present together, it proves that the complex which is known to us is present as a disturbing factor in the person who is being questioned. This disturbance is taken
Besetzung by you to mean that the complex in his mind is cathected [*besetzt*][T] with affect and is able to distract his attention from the task of reacting; thus you see in the disturbance a 'psychical self-betrayal'.

I know that you are at the moment concerned with the potentialities and difficulties of this procedure, whose aim is to lead the accused into an objective self-betrayal. I should therefore like to bring to your notice the fact that a very similar method of disclosing psychical material which is buried away or kept secret has been practised for more than a decade in another field. My purpose is to lay before you the resemblances and differences between conditions in the two fields.[2]

The field I have in mind is indeed very different from yours. I am

1 Cf. Jung, 1906. [A further reference to this can be found in a footnote added in 1907 to Chapter XII, Section B of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**.]

2 [Freud made some remarks, of a critical nature, on the association experiment at a meeting of the Vienna Psychoanalytical Society on February 26, 1908. (See the *Minutes*, **1**.)]

referring to the therapy employed for certain 'nervous diseases' – what [108]
are known as the psychoneuroses – of which hysteria and obsessional ideas may be taken as samples. The method is called 'psychoanalysis'; it was evolved by me from the 'cathartic' method of therapy first practised by Josef Breuer in Vienna.[1] To combat your surprise, I must draw an analogy between the criminal and the hysteric. In both we are concerned with a secret, with something hidden. But in order not to be paradoxical I must at once point out the difference. In the case of the criminal it is a secret which he knows and hides from you, whereas in the case of the hysteric it is a secret which he himself does not know either, which is hidden even from himself. How is this possible? Now we know, through laborious research, that all these illnesses are the result of the patient's having succeeded in repressing [*verdrängen*][T] certain ideas and mem- *Verdrängung*
ories that are strongly cathected with affect, together with the wishes that arise from them, in such a way that they play no part in his thinking – do not enter into his consciousness – and thus remain unknown to him. But from this repressed psychical material (these 'complexes') are generated the somatic and psychical symptoms which plague the patient in just the same way as a guilty conscience does. In this one respect, therefore, the difference between the criminal and the hysteric is fundamental.

The task of the therapist, however, is the same as that of the examining magistrate. We have to uncover the hidden psychical material; and in order to do this we have invented a number of detective devices, some of which it seems that you gentlemen of the law are now about to copy from us.

It will interest you, from the point of view of your own profession, to hear how we doctors proceed in psychoanalysis. After the patient has given us a first account of his history, we ask him to give himself up to the thoughts that occur to him spontaneously and to say without any critical reserve whatever comes into his head. We start, as you see, on the assumption, which he does not share in the least, that these spontaneous [109]
thoughts will not be arbitrarily chosen but will be determined by their relation to his secret – to his 'complex' – and may, as it were, be regarded as derivatives of that complex. You will note that this is the same assumption as the one with the help of which you were able to interpret the association experiments. But although we have instructed the patient to follow the rule of communicating all the thoughts that occur to him, he seems to be unable to do so. He soon begins to hold back first one

1 Cf. Breuer & Freud, *Studies on Hysteria*, 1895*d*.

thought and then another. He gives various reasons to account for this: either the thought was quite unimportant, or it was irrelevant or it was totally meaningless. We thereupon demand that he shall tell us the thought in spite of these objections and shall follow it up; for the very fact of his criticism proves to us that the thought belongs to the 'complex' which we are seeking to uncover. We recognize in this behaviour of the patient's a manifestation of the 'resistance' present in him, which we are never free from through the whole duration of the treatment. I will merely indicate briefly that this concept of resistance has acquired the highest importance for us in understanding the origin of an illness as well as the mechanism of its cure.

In your experiments you do not directly observe criticisms like these of his spontaneous ideas by the subject; while we, on the other hand, are able in our psychoanalyses to observe all the indications of a complex which come to your notice. When the patient no longer ventures to evade the rule which has been laid down for him, we nevertheless note that he stops or hesitates from time to time or makes pauses in the reproduction of his ideas. Every hesitation of this kind is, as we see it, an expression of his resistance and serves as an indication of a connection with the 'complex'. Indeed, we regard it as the most important sign of such a connection, just as is in your case the analogous prolongation of
Deutung the *reaction time*.[1] We are accustomed to interpret [*deuten*][T] hesitation in this sense even when the content of the idea that is being held back
[110] does not seem to be at all objectionable and when the patient assures us he cannot imagine why he should hesitate to tell it to us. The pauses which occur in psychoanalysis are as a rule many times longer than the delays that you observe in the reaction experiments.

Another of your indications of a complex – the change in the *content* of the reaction[2] – also plays its part in the technique of psychoanalysis. We quite generally regard even slight deviations in our patients from the ordinary forms of expression as a sign of some hidden meaning, and we are quite willing to expose ourselves for a while to the patient's ridicule by making interpretations in that sense. Indeed, we are on the look-out for remarks which suggest any ambiguity and in which the hidden meaning glimmers through an innocent expression. Not only patients but medical colleagues who are ignorant of the technique of psychoanalysis and its special features are incredulous about this and accuse us of being too clever and playing with words; but we are nearly always in the right.

1 [See point 2 on p. 86 above.]

2 [Point 1 on p. 86.]

After all, it is not difficult to understand that the only way in which a carefully guarded secret betrays itself is by subtle, or at most ambiguous, allusions. In the end the patient becomes accustomed to disclosing to us, by means of what is known as 'indirect representation', all that we require in order to uncover the complex.

The third of your indications of a complex (mistakes – that is, changes – in the *reproduction* [of the reaction])[1] is also employed, though in a more restricted field, in the technique of psychoanalysis. One task which often faces us is the interpretation of dreams – that is, the translation [*Übersetzung*][T] of the remembered content of a dream into its hidden meaning. It sometimes happens that we are uncertain at which point to set about the task, and in that case we may make use of a rule, discovered empirically, which recommends us to get the dreamer to tell us his dream once more. In doing so, he usually alters his modes of expression in some parts of it while repeating the rest accurately. The points at which his reproduction is defective owing to changes, and often owing to omissions as well, are the points which we fasten upon, because the inaccuracy guarantees a connection with the complex and promises the best approach to the secret meaning of the dream.[2] [111]

You must not get the impression that we have come to an end of the points of agreement which I have been following up if I admit to you that no phenomenon similar to *perseveration*[3] is manifested in psychoanalysis. This apparent difference only arises from the special conditions of your experiments. For you do not allow the effect of the complex time to develop. Scarcely has it begun to act than you distract the subject's attention by a new and probably innocent stimulus word; and then you may observe that he sometimes continues to be occupied with the complex in spite of your interference. In psychoanalysis, on the other hand, we avoid such interferences and keep the patient occupied with the complex. Since in our procedure *everything*, so to speak, is perseveration, we cannot observe that phenomenon as an isolated occurrence.

We may justly claim that, in principle, techniques of the kind I have described enable us to make the patient conscious of what is repressed in him – of his secret – and thus to remove the psychological causation of the symptoms from which he is suffering. But before you draw any conclusions from these successful results as to the possibilities of your

1 [Point 3 on p. 86 above.]

2 See my *Interpretation of Dreams* (1900*a*) [*RSE*, **5**, 460 f.].

3 [Point 4 on p. 86 above.]

own work, we will examine some points of difference between the psychological situations in the two cases.

The chief difference has already been named. In the neurotic the secret is hidden from his own consciousness; in the criminal it is hidden only from you. In the former there is a genuine ignorance, though not an ignorance in every sense, while in the latter there is nothing but a pre-
[112] tence of ignorance. Connected with this is another difference, which is in practice of importance. In psychoanalysis the patient assists with his conscious efforts to combat his resistance, because he expects to gain something from the investigation, namely, his recovery. The criminal, on the other hand, does not work with you; if he did, he would be working against his whole ego [*Ich*]T. As though to make up for this, however, all you are endeavouring to arrive at in your investigation is an objective certainty on your part, whereas our therapy demands that the patient himself should also arrive at the same certainty. But it remains to be seen how far your procedure will be rendered more difficult or be altered by the lack of cooperation on the part of the subject of your examination. This is a situation which you can never create in your experiments in seminars, since the colleague who is playing the part of the accused man remains a fellow worker after all, and assists you in spite of his conscious determination not to betray himself.

If you look more deeply into the comparison between the two situations it will become clear to you in general that psychoanalysis is concerned with a simpler, special, form of the task of uncovering what is hidden in the mind; whereas in your work the task is a more comprehensive one. That the case of the psychoneurotic is invariably concerned with a repressed sexual complex (in the widest sense) is a difference which you need not take into account. But there is something else that you must. The aim of psychoanalysis is absolutely uniform in every case: complexes have to be uncovered which have been repressed because of feelings of unpleasure and which produce signs of resistance if an attempt is made to bring them into consciousness. This resistance is as it were localized; it arises at the frontier between unconscious and conscious. In your cases what is concerned is a resistance which comes entirely from consciousness. You cannot dismiss this difference out of hand. You will first have to determine experimentally whether conscious resistance is betrayed by exactly the same indications as unconscious resistance.
[113] Further, you cannot yet be certain, in my opinion, whether you may interpret your objective indications of a complex as a 'resistance', as we psychotherapists do. It may happen with your experimental

subjects – even though not very frequently with criminals – that the complex you touch on is pleasurably toned [*mit Lust*[T] *betonter*]; and the question then arises whether such a complex will produce the same reaction as a complex that is unpleasurably toned [*mit Unlust*].

I should also like to point out that your test may possibly be subject to a complication which does not, by its very nature, arise in psychoanalysis. In your examination you may be led astray by a neurotic who, although he is innocent, reacts as if he were guilty, because a lurking sense of guilt that already exists in him seizes upon the accusation made in the particular instance. You must not regard this possibility as an idle fiction; you have only to think of life in the nursery, where such events can often enough be observed. It sometimes happens that a child who has been accused of a misdeed strongly denies the charge but at the same time weeps like a detected sinner. You may perhaps think that the child is lying when he asserts his innocence; but this is not necessarily so. It can be that he has, in fact, not committed the particular crime with which you have charged him but that he has committed one of which you know nothing and of which you are not accusing him. He therefore quite truthfully denies being guilty of the one misdeed, while at the same time betraying his sense of guilt on account of the other.[1] In this respect – as in so many others – the adult neurotic behaves just like a child. Many people are like this, and it is still open to question whether your technique will succeed in distinguishing self-accusing individuals of this kind from those who are really guilty. Finally, one more point. You know that, according to the rules governing criminal proceedings, you may not subject the accused to any procedure which takes him by surprise. He will therefore have been made aware that in this experiment it is a matter for him of not betraying himself. It must then be asked whether one can [114] expect the same reactions when the subject's attention is directed towards the complex as when it is directed away from it, and how far the intention to conceal something may affect modes of reaction in different people.

It is precisely because the situations which underlie your investigation are so various that psychology takes a very lively interest in its results, and I should like to beg you not to despair of their practical utility too soon. Although my work is so far removed from the practical administration of justice, perhaps you will allow me to make one further suggestion. However indispensable experiments in seminars may be for

1 [Freud approached this point again much later, in the course of his comments on the 'Expert Opinion in the Halsmann Case' (1930*i*), *RSE*, **21**, 244 ff.].

preparatory purposes and for the formulation of problems, you will never be able to reproduce in them the same psychological situation as in the examination of a defendant in a criminal case. The experiments remain dummy exercises and they can never afford a basis for practical application in criminal trials. If we do not want to abandon such an application of them, the following expedient suggests itself. You might be allowed – indeed, it might be made your duty – to undertake such examinations over a number of years in every actual instance of a criminal prosecution, *without their results being allowed to influence the verdict of the court*. It would, indeed, be best if the court were never informed of the conclusion which you had drawn from your examination on the question of the defendant's guilt. After years of collecting and comparing the results so obtained, all doubts about the serviceability of this psychological method of investigation would surely be resolved. I know, of course, that the realization of a proposal such as this does not rest only with you and your valued teachers.

OBSESSIVE ACTIONS AND RELIGIOUS PRACTICES

The present translation is a revised and corrected reprint of the *SE* version.

This paper was written in February, 1907, for the first issue of a periodical directed by Bresler and Vorbrodt. At a meeting of the Vienna Psychoanalytical Society on February 27, Freud reported that he had sent in a contribution for the inaugural issue of this new periodical and also that Bresler had invited him to be a co-editor and that he had accepted. His name, in fact, appears in the (rather long) list of editorial advisers. The incorrect statement that the paper was read to the Society by Freud on March 2 is derived from Jones's biography (1955, **2**, 380). March 2 was in any case a Saturday and not a Wednesday. Jung was present at the meeting on March 6, when Adler read a case history. (See the *Minutes*, **1**.) This was Freud's introductory incursion into the psychology of religion, and, as he points out in Section V of his 'Short Account of Psychoanalysis' (1924*f*), *RSE*, **19**, it formed a definite step towards his much extended treatment of the subject five years later in *Totem and Taboo* (1912–13*a*), ibid., **13**. But besides this the paper is of great interest as being Freud's first discussion of obsessional neurosis since the Breuer period some ten years earlier. He here gives a sketch of the mechanism of obsessional symptoms which he was to elaborate in the case history of the 'Rat Man' (1909*d*), ibid., **10**, whose treatment, however, he had not begun when he wrote the present work.

OBSESSIVE ACTIONS AND RELIGIOUS PRACTICES

I am certainly not the first person to have been struck by the resemblance between what are called obsessive actions [*Zwangshandlungen*][T] in sufferers from nervous affections and the observances by means of which believers give expression to their piety. The term 'ceremonial', which has been applied to some of these obsessive actions, is evidence of this. The resemblance, however, seems to me to be more than a superficial one, so that an insight into the origin of neurotic ceremonial may embolden us to draw inferences by analogy about the psychological processes of religious life. [117] *Zwang*

People who carry out obsessive actions or ceremonials belong to the same class as those who suffer from obsessive thinking [*Zwangsdenken*], obsessive ideas [*Zwangsvorstellungen*], obsessive impulses [*Zwangsimpulsen*] and the like. Taken together, these form a particular clinical entity, to which the name of 'obsessional neurosis' ['*Zwangsneurose*'] is customarily applied.[1] But one should not attempt to deduce the character of the illness from its name; for, strictly speaking, other kinds of morbid mental phenomena have an equal claim to possessing what are spoken of as 'obsessional' characteristics ['*Zwangscharakter*']. In place of a definition we must for the time being be content with obtaining a detailed knowledge of these states, since we have not yet been able to arrive at a criterion of obsessional neuroses; it probably lies very deep, although we seem to sense its presence everywhere in the manifestations of the illness.

Neurotic ceremonials consist in making small adjustments to particular everyday actions, small additions or restrictions or arrangements, which have always to be carried out in the same, or in a methodically varied, manner. These activities give the impression of [118]

1 See Löwenfeld (1904). [According to that author (ibid., 8) the term '*Zwangsvorstellung*' ('obsessional idea' or simply 'obsession') was introduced by Krafft-Ebing in 1867. The concept (and the term) 'obsessional neurosis' originated (on the same authority, ibid., 296 and 487) from Freud himself. It occurs in a letter to Fliess of February 7, 1894 (Freud, 1950*a*, Letter 16). His first published use of it was in his first paper on anxiety neurosis (1895*b*), *RSE*, **3**, 87.]

being mere formalities, and they seem quite meaningless to us. Nor do they appear otherwise to the patient himself; yet he is incapable of giving them up, for any deviation from the ceremonial is visited by intolerable anxiety [*Angst*][T], which obliges him at once to make his omission good. Just as trivial as the ceremonial actions themselves are the occasions and activities which are embellished, encumbered and in any case prolonged by the ceremonial – for instance, dressing and undressing, going to bed or satisfying bodily needs. The performance of a ceremonial can be described by replacing it, as it were, with a series of unwritten laws. For instance, to take the case of the bed ceremonial: the chair must stand in a particular place beside the bed; the clothes must lie upon it folded in a particular order; the blanket must be tucked in at the bottom and the sheet smoothed out; the pillows must be arranged in such and such a manner, and the subject's own body must lie in a precisely defined position. Only after all this may he go to sleep. Thus in slight cases the ceremonial seems to be no more than an exaggeration of an orderly procedure that is customary and justifiable; but the special conscientiousness with which it is carried out and the anxiety which follows upon its neglect stamp the ceremonial as a 'sacred act'. Any interruption of it is for the most part badly tolerated, and the presence of other people during its performance is almost always ruled out.

Any activities whatever may become obsessive actions in the wider sense of the term if they are elaborated by small additions or given a rhythmic character by means of pauses and repetitions. We shall not expect to find a sharp distinction between 'ceremonials' and 'obsessive actions'. As a rule obsessive actions have grown out of ceremonials. Besides these two, prohibitions and hindrances (abulias) make up the content of the disorder; these, in fact, only continue the work of the
[119] obsessive actions, inasmuch as some things are completely forbidden to the patient and others only allowed subject to his following a prescribed ceremonial.

It is remarkable that both compulsions [*Zwang*] and prohibitions (having to do something and having *not* to do something) apply in the first instance only to the subject's solitary activities and for a long time leave his social behaviour unaffected. Sufferers from this illness are consequently able to treat their affliction as a private matter and keep it concealed for many years. And, indeed, many more people suffer from these forms of obsessional neurosis than doctors hear of. For many sufferers, too, concealment is made easier from the fact that they are quite well able to fulfil their social duties during a part of the day, once they

have devoted a number of hours to their secret doings, hidden from view like Mélusine.[1]

It is easy to see where the resemblances lie between neurotic ceremonials and the sacred acts of religious ritual: in the conscience anxiety brought on by their neglect, in their complete isolation from all other actions (shown in the prohibition against interruption) and in the conscientiousness with which they are carried out in every detail. But the differences are equally obvious, and a few of them are so glaring that they make the comparison a sacrilege: the greater individual variability of [neurotic] ceremonial actions in contrast to the stereotyped character of rituals (prayer, turning to the East, etc.), their private nature as opposed to the public and communal character of religious observances, above all, however, the fact that, while the minutiae of religious ceremonial are full of significance and have a symbolic meaning, those of neurotics seem foolish and senseless. In this respect an obsessional neurosis presents a travesty, half comic and half tragic, of a private religion. But it is precisely this sharpest difference between neurotic and religious ceremonial which disappears when, with the help of the psychoanalytic technique of investigation, one penetrates to the true meaning of obsessive actions.[2] In the course of such an investigation the appearance which obsessive actions afford of being foolish and senseless is completely effaced, and the reason for their having that appearance is explained. It is found that the obsessive actions are perfectly significant in every detail, that they serve important interests of the personality and that they give expression to experiences that are still operative and to thoughts that are cathected with affect [*affektbesetzte*][T]. They do this in two ways, either by direct or by symbolic representation; and they are consequently to be interpreted either historically or symbolically. [120] *Besetzung*

I must give a few examples to illustrate my point. Those who are familiar with the findings of psychoanalytic investigation into the psychoneuroses will not be surprised to learn that what is being represented in obsessive actions or in ceremonials is derived from the most intimate, and for the most part from the sexual, experiences of the patient.

(*a*) A girl whom I was able to observe was under a compulsion to rinse round her wash-basin several times after washing. The significance of this ceremonial action lay in the proverbial saying: 'Don't throw away dirty water till you have clean.' Her action was intended to give a

1 [A beautiful woman in mediaeval legend, who led a secret existence as a water nymph.]

2 See the collection of my shorter papers on the theory of the neuroses published in 1906 [*RSE*, **3**, 5].

warning to her sister, of whom she was very fond, and to restrain her from getting divorced from her unsatisfactory husband until she had established a relationship with a better man.

(*b*) A woman who was living apart from her husband was subject to a compulsion, whenever she ate anything, to leave what was the best of it behind: for example, she would take only the outside of a piece of roast meat. This renunciation was explained by the date of its origin. It appeared on the day after she had refused marital relations with her husband – that is to say, after she had given up what was the best.

(*c*) The same patient could only sit on one particular chair and could only get up from it with difficulty. In regard to certain details of her married life, the chair symbolized her husband, to whom she remained [121] faithful. She found an explanation of her compulsion in this sentence: 'It is so hard to part from anything (a husband, a chair) upon which one has once settled.'

(*d*) Over a period of time she used to repeat an especially noticeable and senseless obsessive action. She would run out of her room into another room in the middle of which there was a table. She would straighten the tablecloth on it in a particular manner and ring for the housemaid. The latter had to come up to the table, and the patient would then dismiss her on some indifferent errand. In the attempts to explain this compulsion, it occurred to her that at one place on the tablecloth there was a stain, and that she always arranged the cloth in such a way that the housemaid was bound to see the stain. The whole scene proved to be a reproduction of an experience in her married life which had later on given her thoughts a problem to solve. On the wedding night her husband had met with a not unusual mishap. He found himself impotent, and 'many times in the course of the night he came hurrying from his room into hers' to try once more whether he could succeed. In the morning he said he would feel ashamed in front of the hotel housemaid who made the beds, and he took a bottle of red ink and poured its contents over the sheet; but he did it so clumsily that the red stain came in a place that was very unsuitable for his purpose. With her obsessive action, therefore, she was representing the wedding night. 'Bed and board'[1] between them make up marriage.

(*e*) Another compulsion which she started – of writing down the number of every banknote before parting with it – had also to be interpreted historically. At a time when she was still intending to leave her husband

1 [In German '*Tisch und Bett*' ('table and bed'). Cf. a paper on fairy tales in dreams (1913*d*), *RSE*, **12**, 280 *n*. 4.]

if she could find another more trustworthy man, she allowed herself to receive advances from a man whom she met at a watering place, but she was in doubt as to whether his intentions were serious. One day, being [122] short of small change, she asked him to change a five-Kronen piece for her. He did so, pocketed the large coin and declared with a gallant air that he would never part with it, since it had passed through her hands. At their later meetings she was frequently tempted to challenge him to show her the five-Kronen piece, as though she wanted to convince herself that she could believe in his intentions. But she refrained, for the good reason that it is impossible to distinguish between coins of the same value. Thus her doubt remained unresolved; and it left her with the compulsion to write down the number of each banknote, by which it *can* be distinguished from all others of the same value.[1]

These few examples, selected from the great number I have met with, are merely intended to illustrate my assertion that in obsessive actions everything has its meaning and can be interpreted. The same is true of ceremonials in the strict sense, only that the evidence for this would require a more circumstantial presentation. I am quite aware of how far our explanations of obsessive actions are apparently taking us from the sphere of religious thought.

It is one of the conditions of the illness that the person who is obeying a compulsion carries it out without understanding its meaning – or at any rate its chief meaning. It is only thanks to the efforts of psychoanalytic treatment that he becomes conscious of the meaning of his obsessive action and, with it, of the motives that are impelling him to it. We express this important fact by saying that the obsessive action serves to express *unconscious* motives and ideas. In this, we seem to find a further departure from religious practices; but we must remember that as a rule the ordinary pious individual, too, performs a ceremonial without concerning himself with its significance, although priests and scientific investigators may be familiar with the – mostly symbolic – meaning of the ritual. In all believers, however, the motives which impel them to [123] religious practices are unknown to them or are represented in consciousness by others which are advanced in their place.

Analysis of obsessive actions has already given us some sort of an insight into their causes and into the chain of motives which bring them into effect. We may say that the sufferer from compulsions and prohibitions behaves as if he were dominated by a *sense of guilt*, of which,

1 [Freud discussed this case again (with reference to the obsessive action described in (*d*) above) at considerable length in Lecture XVII of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 231 ff.]

however, he knows nothing, so that we must call it an unconscious sense of guilt, in spite of the apparent contradiction in terms.[1] This sense of guilt has its source in certain early mental events, but it is constantly being revived by renewed *temptations* which arise whenever there is a contemporary provocation. Moreover, it occasions a lurking sense of *expectant anxiety*, an expectation of misfortune, which is linked, through the idea of *punishment*, with the internal perception of the temptation. When the ceremonial is first being constructed, the patient is still conscious that he must do this or that lest some ill should befall, and as a rule the nature of the ill that is to be expected is still known to his consciousness. But what is already hidden from him is the connection – which is always demonstrable – between the occasion on which this expectant anxiety arises and the danger which it conjures up. Thus a
Abwehr ceremonial starts as an *action for defence* [*Abwehrhandlung*]^{T} or *insurance*, a *protective measure*.

The sense of guilt of obsessional neurotics finds its counterpart in the protestations of pious people that they know that at heart they are miserable sinners; and the pious observances (such as prayers, invocations, etc.) with which such people preface every daily act, and especially
[124] every unusual undertaking, seem to have the value of defensive or protective measures.

A deeper insight into the mechanism of obsessional neurosis is gained if we take into account the primary fact which lies at the bottom of it. This is always *the repression* [*Verdrängung*]^{T} *of a drive impulse*[2]
Trieb, Regung [*Triebregung*]^{T} (a component of the sexual drive) which was present in the subject's constitution and which was allowed to find expression for a while during his childhood but later succumbed to suppression. In the course of the repression of this drive a special *conscientiousness* is created which is directed against the drive's aims; but this psychical
Bildung reaction-formation [*Reaktionsbildung*]^{T} feels insecure and constantly threatened by the drive which is lurking in the unconscious. The influence of the repressed drive is felt as a temptation, and during the process of repression itself anxiety is generated, which gains control over the future in the form of *expectant* anxiety. The process of repression which

1 [The German word used here for 'sense of guilt' is '*Schuldbewusstsein*', literally 'consciousness of guilt'. – This seems to be the earliest explicit appearance of the 'unconscious sense of guilt' which was to play such an important part in Freud's later writings – e.g. in the last chapter of *The Ego and the Id* (1923*b*), *RSE*, **19**, 45 *n.* 1. The way had been prepared for the notion, however, very much earlier, in Section II of the first paper on 'The Neuropsychoses of Defence' (1894*a*), ibid., **3**, 48 ff.]

2 [This appears to be Freud's first published use of what was to be one of his most used terms.]

leads to obsessional neurosis must be considered as one which is only partly successful and which increasingly threatens to fail. It may thus be compared to an unending conflict; fresh psychical efforts are continually required to counterbalance the forward pressure of the drive.[1] Thus the ceremonial and obsessive actions arise partly as a defence against the temptation and partly as a protection against the ill which is expected. Against the temptation the protective measures seem soon to become inadequate; then the prohibitions come into play, with the purpose of keeping at a distance situations that give rise to temptation. Prohibitions take the place of obsessive actions, it will be seen, just as a phobia is designed to avert a hysterical attack. Again, a ceremonial represents the sum of the conditions subject to which something that is not yet absolutely forbidden is permitted, just as the Church's marriage ceremony [125]
signifies for the believer a sanctioning of sexual enjoyment which would otherwise be sinful. A further characteristic of obsessional neurosis, as of all similar affections, is that its manifestations (its symptoms, including the obsessive actions) fulfil the condition of being a compromise between the warring forces of the mind [*seelischen Mächten*][T]. They thus always *Seele, Macht*
reproduce something of the pleasure [*Lust*][T] which they are designed to prevent; they serve the repressed drive no less than the agencies which are repressing it. As the illness progresses, indeed, actions which were originally mostly concerned with maintaining the defence come to approximate more and more to the proscribed actions through which the drive was able to find expression in childhood.

Some features of this state of affairs may be seen in the sphere of religious life as well. The formation of a religion, too, seems to be based on the suppression, the renunciation, of certain drive impulses. These impulses, however, are not, as in the neuroses, exclusively components of the sexual drive; they are self-seeking, socially harmful drives, though, even so, they are usually not without a sexual component. A sense of guilt following upon continual temptation and an expectant anxiety in the form of fear of divine punishment have, after all, been familiar to us in the field of religion longer than in that of neurosis. Perhaps because of the admixture of sexual components, perhaps because of some general characteristics of the drives, the suppression of drive proves to be an inadequate and interminable process in religious life also. Indeed, complete backslidings into sin are more common among pious people than among neurotics and these give rise to a new form of religious

1 [This passage foreshadows the concept of 'anticathexis', which is developed at length in Section IV of the paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 159 ff.]

activity, namely acts of penance, which have their counterpart in obsessional neurosis.

We have noted as a curious and derogatory characteristic of obsessional neurosis that its ceremonials are concerned with the small actions of daily life and are expressed in foolish regulations and restrictions in connection with them. We cannot understand this remarkable feature of
[126] the clinical picture until we have realized that the mechanism of psychical *displacement* [*Verschiebung*][T], which was first discovered by me in the construction of dreams,[1] dominates the mental processes of obsessional neurosis. It is already clear from the few examples of obsessive actions given above that their symbolism and the detail of their execution are brought about by a displacement from the actual, important thing on to a small one which takes its place – for instance, from a husband on to a chair.[2] It is this tendency to displacement which progressively changes the clinical picture and eventually succeeds in turning what is apparently the most trivial matter into something of the utmost importance and urgency. It cannot be denied that in the religious field as well there is a similar tendency to a displacement of psychical values, and in the same direction, so that the petty ceremonials of religious practice gradually become the essential thing and push aside the underlying thoughts. That is why religions are subject to reforms which work retroactively and aim at a re-establishment of the original balance of values.

The character of compromise which obsessive actions possess in their capacity as neurotic symptoms is the character least easily detected in corresponding religious observances. Yet here, too, one is reminded of this feature of neuroses when one remembers how commonly all the acts which religion forbids – the expressions of the drives it has suppressed – are committed precisely in the name of, and ostensibly for the sake of, religion.

In view of these similarities and analogies one might venture to regard obsessional neurosis as a pathological counterpart of the formation of a religion, and to describe that neurosis as an individual religiosity and
[127] religion as a universal obsessional neurosis. The most essential similarity would reside in the underlying renunciation of the activation of drives that are constitutionally present; and the chief difference would lie in

1 See *The Interpretation of Dreams* (1900*a*), Chapter VI, Section B [*RSE*, **4**, 272 ff.].

2 [Freud had already described this mechanism in his book on *Jokes* (1905*c*), in Section 11 of Chapter II; ibid., **8**, 70. He often returned to the point – for instance, in the 'Rat Man' analysis (1909*d*), ibid., **10**, 182, and in the metapsychological paper on repression (1915*d*), ibid., **14**, 139.]

the nature of those drives, which in the neurosis are exclusively sexual in their origin, while in religion they spring from egoistic sources.

A progressive renunciation of constitutional drives, whose activation might afford the ego [*Ich*][T] primary pleasure, appears to be one of the foundations of the development of human civilization[1] [*Kulturentwicklung*][T]. Some part of this drive repression is effected by its religions, in that they require the individual to sacrifice his drive pleasure to the Deity: 'Vengeance is mine, saith the Lord.' In the development of the ancient religions one seems to discern that many things which mankind had renounced as 'iniquities' had been surrendered to the Deity and were still permitted in his name, so that the handing over to him of bad and socially harmful drives was the means by which man freed himself from their domination. For this reason, it is surely no accident that all the attributes of man, along with the misdeeds that follow from them, were to an unlimited amount ascribed to the ancient gods. Nor is it a contradiction of this that nevertheless man was not permitted to justify his own iniquities by appealing to divine example.

The present translation is a revised and corrected reprint of the *SE* version.

This was written at the request of a Hamburg doctor, Dr M. Fürst, for publication in a periodical devoted to social medicine and hygiene of which he was the editor. We know from Ernest Jones (1955, 327–8) that Freud gave a much fuller account of his views on the subject in a discussion at the Vienna Psychoanalytical Society on May 12, 1909. He had already discussed it there at a meeting on December 18, 1907. (See the *Minutes*, **1**.) Some thirty years later he returned to the topic of the 'sexual enlightenment' of children in the last paragraph of Section IV of his paper on 'Analysis Terminable and Interminable' (1937*c*), *RSE*, **23**, 211. He shows there that the question is a considerably less simple one than appears in the present discussion.

THE SEXUAL ENLIGHTENMENT OF CHILDREN

(An Open Letter to Dr M. Fürst)

Dear Dr Fürst, [131]

When you ask me for an expression of opinion on 'the sexual enlightenment of children', I assume that what you want is not a regular, formal treatise on the subject which shall take into account the excessive mass of literature that has grown up around it, but the independent judgement of an individual doctor whose professional activities have offered him special opportunities for concerning himself with sexual problems. I know that you have followed my scientific efforts with interest and that, unlike many of our colleagues, you do not dismiss my ideas without examining them because I regard the psychosexual constitution and certain noxae of sexual life as the most important causes of the neurotic disorders that are so common. My *Three Essays on the Theory of Sexuality* [1905*d*], too, where I have described the way in which the sexual drive [*Geschlechtstriebes*][T] is compounded and the disturbances which may occur in its development into the function of sexuality [*Sexualfunktion*], have recently had a friendly reception in your journal. *Geschlecht*, *Trieb*

I am expected, therefore, to answer questions on the following points: whether children ought to be given any enlightenment at all about the facts of sexual life, at what age this ought to happen and in what manner it should be carried out. Let me admit to you at once that I find a discussion of the second and third points perfectly reasonable, but that to my mind it is quite incomprehensible how there could be a difference of opinion on the first point. What can be the purpose of withholding from children – or, let us say, from young people – enlightenment of this kind about the sexual life of human beings? Is it from a fear of arousing their [132] interest in these matters prematurely, before it awakens in them spontaneously? Is it from a hope that a concealment of this kind may retard the sexual drive altogether until such time as it can find its way into the only channels open to it in our middle-class social order? Is it supposed that children would show no interest or understanding for the facts and

riddles of sexual life if they were not prompted to do so by outside influences? Is it thought possible that the knowledge which is withheld from them will not reach them in other ways? Or is it genuinely and seriously intended that later on they should regard everything to do with sex as something degraded and detestable from which their parents and teachers wished to keep them away as long as possible?

I really do not know in which of these purposes to look for the motive for the concealment of what is sexual from children that is in fact carried out. I only know that they are all equally absurd and that I find it difficult to honour them with a serious refutation. I remember, however, that in the family letters of that great thinker and humanitarian Multatuli, I once found a few lines which are a more than adequate answer:

'To my mind, certain things are in general too much wrapped in a veil. It is right to keep a child's imagination pure, but this purity will not be preserved by ignorance. On the contrary, I think that concealment leads a boy or girl to suspect the truth more than ever. Curiosity leads us to pry into things which, if they had been told us without any great to-do, would have aroused little or no interest in us. If this ignorance could be maintained even, I might become reconciled to it, but that is impossible. The child comes into contact with other children, books come his way which lead him to reflect, and the mystery-making with which his parents treat what he has nevertheless discovered actually increases his desire to know more. This desire, which is only partly satisfied and only in secret, excites his feeling and corrupts his imagination, so that the
[133] child already sins while his parents still believe that he does not know what sin is.'[1]

I do not know how the case could be better stated, but perhaps I may add a few remarks. It is undoubtedly nothing else but the customary prudishness and their own bad conscience over sexual matters that causes adults to adopt this attitude of 'mystery-making' in front of children; but possibly a part is also played by a piece of theoretical ignorance on their part, which we can counteract by giving the adults some enlightenment. It is commonly believed that the sexual drive is absent in children and only begins to emerge in them at puberty when the sexual organs mature. This is a gross error, equally serious in its effects both on knowledge and on practice; and it is so easily corrected by observation that one wonders how it could ever have been made. As a matter of fact, the newborn baby brings sexuality with it into the world, certain sexual sensations

1 Multatuli, 1906, **1**, 26. ['Multatuli' (Latin for 'I have borne much') was the pseudonym of a well-known Dutch writer E. D. Dekker (1820–87). Cf. below, p. 218.]

accompany its development as a suckling and during early childhood, and only very few children would seem to escape sexual activities and sensations before puberty. Anyone who would like to find a detailed exposition of these statements can do so in my *Three Essays on the Theory of Sexuality*, to which I have referred above. There he will learn that the organs of reproduction proper are not the only parts of the body which provide sexual sensations of pleasure [*Lustempfindungen*][T], and *Lust*
that nature has even so ordered matters that actual stimulations of the genitals are unavoidable during early childhood. This period of life, during which a certain quota of what is undoubtedly sexual pleasure is produced by the excitation of various parts of the skin (erotogenic zones), by the activity of certain biological drives and as an accompanying excitation in many affective states, is called the period of *auto-erotism*, to use a term introduced by Havelock Ellis [1898*a*]. All that puberty does is to give the genitals primacy among all the other zones and sources which [134]
produce pleasure, and thus to force erotism into the service of the function of reproduction. This process can naturally undergo certain inhibitions [*Hemmungen*][T], and in many people (those who later become perverts and neurotics) it is only incompletely accomplished. On the other hand, the child is capable long before puberty of most of the psychical manifestations of love – tenderness, for example, devotion and jealousy. Often enough, too, an irruption of these mental states is associated with the physical sensations of sexual excitation, so that the child cannot remain in doubt as to the connection between the two. In short, except for his reproductive power, a child has a fully developed capacity for love long before puberty; and it may be asserted that the 'mystery-making' merely prevents him from being able to gain an intellectual grasp of activities for which he is psychically prepared and physically adjusted.

A child's intellectual interest in the riddles of sex, his desire for sexual knowledge, shows itself accordingly at an unexpectedly early age. If it has not been possible to make observations such as I am now going to put before you more frequently, that can only be because parents are either afflicted with blindness in regard to this interest on the part of their children, or, because, if they cannot overlook it, they at once take steps to stifle it. I know a delightful little boy, now four years old, whose understanding parents abstain from forcibly suppressing one part of the child's development. Little Hans has certainly not been exposed to anything in the nature of seduction by a nurse, yet he has already for some time shown the liveliest interest in the part of the body which he calls his

'widdler'. When he was only three he asked his mother: 'Mummy, have you got a widdler too?' His mother answered: 'Of course. What did you think?' He also asked his father the same question repeatedly. At the same age he was taken to a cowshed for the first time and saw a cow being milked. 'Oh look!' he said, in surprise, 'there's milk coming out of its widdler!' At the age of three and three-quarters he was on the way to
[135] making an independent discovery of correct categories by means of his observations. He saw some water being let out of an engine and said, 'Oh, look, the engine's widdling. Where's it got its widdler?' He added afterwards in reflective tones: 'A dog and a horse have widdlers; a table and a chair haven't.' Recently he was watching his seven-day-old little sister being given a bath. 'But her widdler's still quite small', he remarked; 'when she grows up it'll get bigger all right.' (I have been told of this same attitude towards the problem of sex distinction in other boys of similar age.) I should like to say explicitly that Little Hans is not a sensual child or at all pathologically disposed. The fact is simply, I think, that, not having been intimidated or oppressed with a sense of guilt, he gives expression quite ingenuously to what he thinks.[1]

The second great problem which exercises a child's mind – only at a somewhat later age, no doubt[2] – is the question of the origin of babies. This is usually started by the unwelcome arrival of a small brother or sister. It is the oldest and most burning question that confronts immature humanity. Those who understand how to interpret myths and legends can detect it in the riddle which the Theban Sphinx set to Oedipus. The
[136] customary answers given to the child in the nursery damage his genuine drive to research [*Forschertrieb*] and as a rule deal the first blow, too, at his confidence in his parents. From that time on he usually begins to mistrust grown-up people, and to keep his most intimate interests secret from them. The following little document shows how tormenting this curiosity can become in older children. It is a letter written by a

1 [*Footnote added* 1924:] The history of Little Hans's later illness and recovery is described in my 'Analysis of a Phobia in a Five-Year-Old Boy' (1909*b*) [where this material is repeated. When the present paper was first published the boy was given the name of 'Little Herbert'; this was changed to 'Little Hans' in the German editions from 1924 onwards, though not in the English translation of that year. At the time of the publication of this paper 'Little Hans's' analysis was still in progress.]

2 [In Freud's earlier writings he asserts as a rule that the problem of the origin of babies is the first one to engage a child's interest. See, for instance, the paper on the sexual theories of children (1908*c*), written not long after this one (p. 186 below), the case history of 'Little Hans' (1909*b*), *RSE*, **10**, 101, and a passage added in 1915 to the *Three Essays* (1905*d*), ibid., **7**, 172. In the sentence in the text above, however, he appears to put it second to the problem of the distinction between the sexes; and this is the view to which he reverts, at all events as regards girls, in a footnote to his much later paper on this latter topic (1925*j*), ibid., **19**, 253 *n.* 2.]

motherless girl of eleven and a half who had been speculating on the problem with her younger sister.

'Dear Aunt Mali,

'Will you please be so kind as to tell me how you got Christel and Paul. You must know because you are married. We were arguing about it yesterday evening and we want to know the truth. We have nobody else to ask. When are you coming to Salzburg? You know, Aunt Mali, we simply can't understand how the stork brings babies. Trudel thought the stork brings them in a shirt. Then we want to know as well if the stork gets them out of the pond and why one never sees babies in ponds. And will you please tell me, too, how one knows beforehand when one is going to have one. Write and tell me everything about it.

'With thousands of greetings and kisses from us all,

'Your inquisitive niece,

Lili.'

I do not believe that this touching letter brought the two sisters the enlightenment they wanted. Later on the writer of it fell ill of the neurosis that arises from unanswered unconscious questions – of obsessional brooding [*Zwangsgrübelsucht*].[1]

There does not seem to me to be a single good reason for denying children the enlightenment which their thirst for knowledge demands. To be sure, if it is the purpose of educators to stifle the child's power of independent thought as early as possible, in favour of the 'goodness' which they think so much of, they cannot set about this better than by deceiving him in sexual matters and intimidating him in matters of religion. The stronger natures will, it is true, withstand these influences and become rebels against the authority of their parents and later against every other authority. If children are not given the explanations for which they turn to their elders, they go on tormenting themselves with the problem in secret and produce attempts at solution in which the truth they have guessed is mingled in the most extraordinary way with grotesque untruths; or they whisper information to one another in which, because of the young enquirers' sense of guilt, everything sexual is stamped as being horrible and disgusting. These infantile sexual [137]

1 [*Footnote added* 1924:] After some years, however, her obsessional brooding gave way to a dementia praecox. – [Freud had read this letter to the Vienna Psychoanalytical Society on February 13, 1907. (See the *Minutes*, **1**.) He returns to the subject of unanswered questions on p. 190 f. below.]

theories would be well worth collecting and examining.[1] From this time on, children usually lose the only proper attitude to sexual questions, and many of them never regain it.

It seems that the large majority of authors, both men and women, who have written about the sexual enlightenment of youth have concluded in favour of it. But the clumsiness of most of their proposals as to when and how this enlightenment is to take place tempts one to think that they have not found it easy to arrive at this conclusion. So far as my knowledge of the literature goes, a single outstanding exception is provided by the charming letter of explanation which a certain Frau Emma Eckstein quotes as having been written by her to her son when he was about ten years old.[2] The customary method is obviously not quite the right one: all sexual knowledge is kept from children as long as possible, and then on one single occasion a disclosure is made to them in solemn and turgid language, and even so is only half the truth and generally comes too late. Most of the answers to the question 'How am I to tell my children?' make such a miserable impression, on me at least, that I
[138] should prefer parents not to embark on the business of enlightenment at all. What is really important is that children should never get the idea that one wants to make more of a secret of the facts of sexual life than of any other matter which is not yet accessible to their understanding; and to ensure this it is necessary that from the very first what has to do with sexuality should be treated like anything else that is worth knowing about. Above all, it is the duty of schools not to evade the mention of sexual matters. The main facts of reproduction and their significance should be included in lessons about the animal kingdom, and at the same time stress should be laid on the fact that man shares every essential in his organization with the higher animals. Then, provided that the child's home environment does not aim directly at frightening him off thinking, something that I once overheard in a nursery will probably happen more often. I heard a boy saying to his little sister: 'How can you think babies are brought by the stork! You know man's a mammal; d'you think storks bring other mammals their babies too?'

The child's curiosity will never reach a very high degree of intensity provided it finds appropriate satisfaction at each stage of his learning. Enlightenment about the specific facts of human sexuality and an indication of its social significance should, therefore, be given to the child at

1 [Freud himself carried out this suggestion soon afterwards. See below, p. 183 ff., the paper on these theories, in which much of the present argument is elaborated.]

2 Emma Eckstein, 1904.

the end of his time at his elementary school [*Volksschule*] and before he enters his intermediate school [*Mittelschule*] – that is to say, before he is ten years old. The period of confirmation would be a more suitable time than any other at which to instruct the child, who will by that time have a full knowledge of all the physical facts, in the moral obligations which are attached to the actual satisfaction of the drive. Enlightenment about sexual life carried out along such lines as this, proceeding step by step and without any real interruption, and in which the school takes the initiative, seems to me to be the only kind which takes into account the child's development and thus successfully avoids the dangers involved.

I consider it the most significant advance in child education that in France the State should have introduced, in place of the catechism, a [139]
primer which gives the child his first instruction in his position as a citizen and in the ethical duties which will later devolve on him. But such elementary instruction is seriously deficient, so long as it does not include the field of sexuality. Here is the gap which educators and reformers should set about filling. In countries which have placed the education of children wholly or in part in the hands of the clergy, it will, of course, be impossible to ask for this. A priest will never admit that men and animals have the same nature, since he cannot do without the immortality of the soul [*Seele*][T], which he requires as the basis for moral precepts. Here, once again, we see the unwisdom of sewing a single silk patch on to a tattered coat – the impossibility of carrying out an isolated reform without altering the foundations of the whole system.[1]

1 [Freud makes the same point, in connection with marriage, in his paper on 'civilized' sexual morality (1908*d*), p. 171 below.]

Medallion by Karl Maria Schwerdtner, 1906

Medallion by Karl Maria Schwerdtner, 1906

It was presented to Freud by the small group of his Viennese adherents on the occasion of his fiftieth birthday. When Ernest Jones asked Freud to translate the Greek inscription on the reverse side, which depicted Oedipus answering the Sphinx, 'he modestly said I must ask someone else to do it' (Jones, 1955, 15). It invoked the famous line by Sophocles: 'He solved the ancient riddle and was a man most mighty.'

The present translation is a revised and corrected reprint of the *SE* version.

This was originally delivered as a lecture on December 6, 1907, before an audience of ninety, in the rooms of the Viennese publisher and bookseller Hugo Heller, who was himself a member of the Vienna Psychoanalytical Society. A very accurate summary of the lecture appeared next day in the Viennese daily *Die Zeit*; but Freud's full version was first published early in 1908 in a newly established Berlin literary periodical.

Some of the problems of creative writing had been touched on shortly before in Freud's study on *Gradiva* (e.g. on p. 72 above); and a year or two earlier he had approached the question in an essay on 'Psychopathic Characters on the Stage' (1942*a* [1905–06]), *RSE*, 7. The centre of interest in the present paper, however, as well as in the next one, written at about the same time, lies in its discussion of phantasies.

CREATIVE WRITERS AND DAYDREAMING

We laymen have always been intensely curious to know – like the cardinal who put a similar question to Ariosto[1] – from what sources that strange being, the creative writer [*Dichter*],[2] draws his material, and how he manages to make such an impression on us with it and to arouse in us emotions of which, perhaps, we had not even thought ourselves capable. Our interest is only heightened the more by the fact that, if we ask him, the writer himself gives us no explanation, or none that is satisfactory; and it is not at all weakened by our knowledge that not even the clearest insight into the determinants of his choice of material and into the nature of the art of creating imaginative form will ever help to make creative writers of *us*. [143]

If we could at least discover in ourselves or in people like ourselves an activity which was in some way akin to creative writing! An examination of it would then give us a hope of obtaining the beginnings of an explanation of the creative work of writers. And, indeed, there is some prospect of this being possible. After all, creative writers themselves like to lessen the distance between their kind and the common run of humanity; they so often assure us that every man is a poet [*Dichter*] at heart and that the last poet will not perish till the last man does.

Should we not look for the first traces of imaginative activity as early as in childhood? The child's best-loved and most intense occupation is with his play or games. Might we not say that every child at play behaves like a creative writer, in that he creates a world of his own, or, rather, rearranges the things of his world in a new way which pleases him? It would be wrong to think he does not take that world seriously; on the contrary, he takes his play very seriously and he expends large amounts of emotion on it. The opposite of play is not what is serious but what is real. In spite of all the emotion with which he cathects [*Affektbesetzung*][T] [144] *Besetzung*

1 [Cardinal Ippolito d'Este was Ariosto's first patron, to whom he dedicated the *Orlando Furioso*. The poet's only reward was the question: 'Where did you find so many stories, Lodovico?']

2 [A *Dichter* is a 'poet' in the broad sense, i.e. a literary artist.]

his world of play, the child distinguishes it quite well from reality; and he likes to link his imagined objects and situations to the tangible and visible things of the real world. This linking [*Anlehnung*][T] is all that
Phantasie differentiates the child's 'play' from 'phantasying' ['*Phantasieren*'][T].

The creative writer does the same as the child at play. He creates a world of phantasy which he takes very seriously – that is, which he invests with large amounts of emotion – while separating it sharply from reality. Language has preserved this relationship between children's play and poetic creation. It gives [in German] the name of '*Spiel*' ['play'] to those forms of imaginative writing which need to be linked to tangible objects and which are capable of representation. It speaks of a '*Lustspiel*'[T] or '*Trauerspiel*' ['comedy' or 'tragedy', literally 'pleasure play' or 'mourning play'] and describes those who carry out the representation as '*Schauspieler*' ['players', literally 'show-players']. The unreality of the writer's imaginative world, however, has very important consequences for the technique of his art; for many things which, if they were real, could give no enjoyment can do so in the play of phantasy, and many excitements [*Erregungen*][T] which, in themselves, are actually distressing can become a source of pleasure for the hearers and spectators at the performance of a writer's work.

There is another consideration for the sake of which we will dwell a moment longer on this contrast between reality and play. When the child has grown up and has ceased to play, and after he has been labouring for decades to envisage the realities of life with proper seriousness, he may one day find himself in a mental situation which once more undoes the contrast between play and reality. As an adult he can look
[145] back on the intense seriousness with which he once carried on his games in childhood; and, by equating his ostensibly serious occupations of today with his childhood games, he can throw off the too heavy burden imposed on him by life and win the high yield of pleasure afforded by *humour*.[1]

As people grow up, then, they cease to play, and they seem to give up the yield of pleasure which they gained from playing. But whoever
Seele understands the human mind [*Seelenleben*][T] knows that hardly anything is harder for a man than to give up a pleasure which he has once experienced. Actually, we can never give anything up; we only exchange one thing for another. What appears to be a renunciation is really the formation of a substitute or surrogate. In the same way, the growing child, when he stops playing, gives up nothing but the link with real objects;

1 [See Section 7 of Chapter VII of Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 198 ff.]

instead of *playing*, he now *phantasies*. He builds castles in the air and creates what are called *daydreams* [*Tagträume*]. I believe that most people construct phantasies at times in their lives. This is a fact which has long been overlooked and whose importance has therefore not been sufficiently appreciated.

People's phantasies are less easy to observe than the play of children. The child, it is true, plays by himself or forms a closed psychical system with other children for the purposes of a game; but even though he may not play his game in front of the grown-ups, he does not, on the other hand, conceal it from them. The adult, on the contrary, is ashamed of his phantasies and hides them from other people. He cherishes his phantasies as his most intimate possessions, and as a rule he would rather confess his misdeeds than tell anyone his phantasies. It may come about that for that reason he believes he is the only person who invents such phantasies and has no idea that creations of this kind are widespread among other people. This difference in the behaviour of a person who plays and a person who phantasies is accounted for by the motives [*Motiven*][T] of these two activities, which are nevertheless adjuncts to each other.

A child's play is determined by wishes: in point of fact by a single wish [146]
– one that helps in his upbringing – the wish to be big and grown up. He is always playing at being 'grown up', and in his games he imitates what he knows about the lives of his elders. He has no reason to conceal this wish. With the adult, the case is different. On the one hand, he knows that he is expected not to go on playing or phantasying any longer, but to act in the real world; on the other hand, some of the wishes which give rise to his phantasies are of a kind which it is essential to conceal. Thus he is ashamed of his phantasies as being childish and as being impermissible.

But, you will ask, if people make such a mystery of their phantasying, how is it that we know such a lot about it? Well, there is a class of human beings upon whom, not a god, indeed, but a stern goddess – Necessity – has allotted the task of telling what they suffer and what things give them happiness.[1] These are the victims of nervous illness, who are obliged to tell their phantasies, among other things, to the doctor by whom they expect to be cured by mental treatment. This is our best source of

1 [This is an allusion to some well-known lines spoken by the poet-hero in the final scene of Goethe's *Torquato Tasso*:

'Und wenn der Mensch in seiner Qual verstummt,
Gab mir ein Gott, zu sagen, wie ich leide.'
'And when mankind is dumb in its torment, a god granted me to tell how I suffer.']

knowledge, and we have since found good reason to suppose that our patients tell us nothing that we might not also hear from healthy people.

Let us now make ourselves acquainted with a few of the characteristics of phantasying. We may lay it down that a happy person never phan-
Trieb tasies, only an unsatisfied one. The driving forces [*Triebkräfte*][T] of phantasies are unsatisfied wishes, and every single phantasy is the fulfilment of a wish, a correction of unsatisfying reality. These motivating wishes vary according to the sex, character and circumstances of the person who is having the phantasy; but they fall naturally into two main
[147] groups. They are either ambitious wishes, which serve to elevate the subject's personality; or they are erotic ones. In young women the erotic wishes predominate almost exclusively, for their ambition is as a rule absorbed by erotic trends. In young men egoistic [*eigensüchtigen*] and ambitious wishes come to the fore clearly enough alongside of erotic ones. But we will not lay stress on the opposition between the two trends; we would rather emphasize the fact that they are often united. Just as, in many altar-pieces, the portrait of the donor is to be seen in a corner of the picture, so, in the majority of ambitious phantasies, we can discover in some corner or other the lady for whom the creator of the phantasy performs all his heroic deeds and at whose feet all his triumphs are laid. Here, as you see, there are strong enough motives for concealment; the well-brought-up young woman is only allowed a minimum of erotic desire, and the young man has to learn to suppress the excess of self-regard which he brings with him from the spoilt days of his childhood, so that he may find his place in a society which is full of other individuals making equally strong demands.

We must not suppose that the products of this imaginative activity – the various phantasies, castles in the air and daydreams – are stereotyped or unalterable. On the contrary, they fit themselves into the subject's shifting impressions of life, change with every change in his situation, and receive from every fresh active impression what might be called a 'date mark'. The relation of a phantasy to time is in general very important. We may say that it hovers, as it were, between three times – the three moments of time which our ideation involves. Mental work is linked to some current impression, some provoking occasion in the present which has been able to arouse one of the subject's major wishes. From there it harks back to a memory of an earlier experience (usually an infantile one) in which this wish was fulfilled; and it now creates a situation relating to the future which represents a fulfilment of the wish. What it thus creates is a daydream or phantasy, which carries about it traces of its

origin from the occasion which provoked it and from the memory. Thus past, present and future are strung together, as it were, on the thread of the wish that runs through them. [148]

A very ordinary example may serve to make what I have said clear. Let us take the case of a poor orphan boy to whom you have given the address of some employer where he may perhaps find a job. On his way there he may indulge in a daydream appropriate to the situation from which it arises. The content of his phantasy will perhaps be something like this. He is given a job, finds favour with his new employer, makes himself indispensable in the business, is taken into his employer's family, marries the charming young daughter of the house, and then himself becomes a director of the business, first as his employer's partner and then as his successor. In this phantasy, the dreamer has regained what he possessed in his happy childhood – the protecting house, the loving parents and the first objects of his affectionate feelings. You will see from this example the way in which the wish makes use of an occasion in the present to construct, on the pattern of the past, a picture of the future.

There is a great deal more that could be said about phantasies; but I will only allude as briefly as possible to certain points. If phantasies become over-luxuriant and over-powerful, the conditions are laid for an onset of neurosis or psychosis. Phantasies, moreover, are the immediate mental precursors to the distressing symptoms complained of by our patients. Here a broad bypath branches off into pathology.

I cannot pass over the relation of phantasies to dreams. Our dreams at night are nothing else than phantasies like these, as we can demonstrate from the interpretation [*Deutung*][T] of dreams.[1] Language, in its unrivalled wisdom, long ago decided the question of the essential nature of dreams by giving the name of 'daydreams' to the airy creations of phantasy. If the meaning of our dreams usually remains obscure to us in spite of this pointer, it is because of the circumstance that at night there also arise in us wishes of which we are ashamed; these we must conceal from ourselves, and they have consequently been repressed [*verdrängt*][T], pushed into the unconscious. Repressed wishes of this sort and their derivatives are only allowed to come to expression in a very distorted form. When scientific work had succeeded in elucidating this factor of *dream distortion*, it was no longer difficult to recognize that night dreams are wish fulfilments in just the same way as daydreams – the phantasies which we all know so well. [149] *Verdrängung*

1 Cf. Freud, *The Interpretation of Dreams* (1900*a*).

So much for phantasies. And now for the creative writer. May we really attempt to compare the imaginative writer with the 'dreamer in broad daylight',[1] and his creations with daydreams? Here we must begin by making an initial distinction. We must separate writers who, like the ancient authors of epics and tragedies, take over their material ready-made, from writers who seem to originate their own material. We will keep to the latter kind, and, for the purposes of our comparison, we will choose not the writers most highly esteemed by the critics, but the less pretentious authors of novels, romances and short stories, who nevertheless have the widest and most eager circle of readers of both sexes. One feature above all cannot fail to strike us about the creations of these story-writers: each of them has a hero who is the centre of interest, for whom the writer tries to win our sympathy by every possible means and whom he seems to place under the protection of a special Providence. If, at the end of one chapter of my story, I leave the hero unconscious and bleeding from severe wounds, I am sure to find him at the beginning of the next being carefully nursed and on the way to recovery; and if the first volume closes with the ship he is in going down in a storm at sea, I am certain, at the opening of the second volume, to read of his miraculous rescue – a rescue without which the story could not proceed. The feeling of security with which I follow the hero through his perilous
[150] adventures is the same as the feeling with which a hero in real life throws himself into the water to save a drowning man or exposes himself to the enemy's fire in order to storm a battery. It is the true heroic feeling, which one of our best writers has expressed in an inimitable phrase: 'Nothing can happen to *me*!'[2] It seems to me, however, that through this revealing characteristic of invulnerability we can immediately recognize His Majesty the Ego [*Ich*][T], the hero alike of every daydream and of every story.[3]

Other typical features of these egocentric [*egozentrischen*] stories point to the same kinship. The fact that all the women in the novel invariably fall in love with the hero can hardly be looked on as a portrayal of reality, but it is easily understood as a necessary constituent of a daydream. The same is true of the fact that the other characters in the story are sharply divided into good and bad, in defiance of the variety of human characters that are to be observed in real life. The 'good' ones are the helpers, while the 'bad' ones are the enemies and rivals, of the ego which has become the hero of the story.

1 ['*Der Träumer am hellichten Tag*.']

2 ['*Es kann dir nix g'schehen!*'[T] This phrase from Anzengruber, the Viennese dramatist, was a favourite one of Freud's. Cf. 'Thoughts for the Times on War and Death' (1915*b*), *RSE*, **14**, 296.]

3 [Cf. 'On Narcissism' (1914*c*), ibid., **14**, 79.]

We are perfectly aware that very many imaginative writings are far removed from the model of the naive daydream; and yet I cannot suppress the suspicion that even the most extreme deviations from that model could be linked with it through an uninterrupted series of transitional cases. It has struck me that in many of what are known as 'psychological' novels only one person – once again the hero – is described from within. The author sits inside his mind, as it were, and looks at the other characters from outside. The psychological novel in general no doubt owes its special nature to the inclination of the modern writer to split up his ego, by self-observation, into many part-egos, and, in consequence, to personify the conflicting currents of his own mental life in several heroes. Certain novels, which might be described as 'eccentric', seem to stand in quite special contrast to the type of the daydream. In these, the person who is introduced as the hero plays only a very small active part; he sees the actions and sufferings of other people pass before him like a spectator. Many of Zola's later works belong to this category. But I must point out that the psychological analysis of individuals who are not creative writers, and who diverge in some respects from the so-called norm, has shown us analogous variations of the daydream, in which the ego contents itself with the role of spectator. [151]

If our comparison of the imaginative writer with the daydreamer, and of poetical creation with the daydream, is to be of any value, it must, above all, show itself in some way or other fruitful. Let us, for instance, try to apply to these authors' works the thesis we laid down earlier concerning the relation between phantasy and the three periods of time and the wish which runs through them; and, with its help, let us try to study the connections that exist between the life of the writer and his works. No-one has known, as a rule, what expectations to frame in approaching this problem; and often the connection has been thought of in much too simple terms. In the light of the insight we have gained from phantasies, we ought to expect the following state of affairs. A strong experience in the present awakens in the creative writer a memory of an earlier experience (usually belonging to his childhood) from which there now proceeds a wish which finds its fulfilment in the creative work. The work itself exhibits elements of the recent provoking occasion as well as of the old memory.[1]

Do not be alarmed at the complexity of this formula. I suspect that in fact it will prove to be too exiguous a pattern. Nevertheless, it may

1 [A similar view had already been suggested by Freud in a letter to Fliess of July 7, 1898, on the subject of one of C. F. Meyer's short stories (Freud, 1950*a*, Letter 92).]

contain a first approach to the true state of affairs; and, from some experiments I have made, I am inclined to think that this way of looking
[152] at creative writings may turn out not unfruitful. You will not forget that the stress it lays on childhood memories in the writer's life – a stress which may perhaps seem puzzling – is ultimately derived from the assumption that a piece of creative writing, like a daydream, is a continuation of, and a substitute for, what was once the play of childhood.

We must not neglect, however, to go back to the kind of imaginative works which we have to recognize, not as original creations, but as the refashioning of ready-made and familiar material [p. 128 above]. Even here, the writer keeps a certain amount of independence, which can express itself in the choice of material and in changes in it which are often quite extensive. Insofar as the material is already at hand, however, it is derived from the popular treasure-house of myths, legends and fairy tales. The study of constructions of folk psychology such as these is far from being complete, but it is extremely probable that myths, for instance, are distorted vestiges of the wishful phantasies of whole nations, the *secular dreams* of youthful humanity.

You will say that, although I have put the creative writer first in the title of my paper, I have told you far less about him than about phantasies. I am aware of that, and I must try to excuse it by pointing to the present state of our knowledge. All I have been able to do is to throw out some encouragements and suggestions which, starting from the study of phantasies, lead on to the problem of the writer's choice of his literary material. As for the other problem – by what means the creative writer achieves the emotional effects in us that are aroused by his creations – we have as yet not touched on it at all. But I should like at least to point out to you the path that leads from our discussion of phantasies to the problems of poetical effects.

You will remember how I have said [p. 125] that the daydreamer carefully conceals his phantasies from other people because he feels he has reasons for being ashamed of them. I should now add that even if he were
[153] to communicate them to us he could give us no pleasure by his disclosures. Such phantasies, when we learn them, repel us or at least leave us cold. But when a creative writer presents his plays to us or tells us what we are inclined to take to be his personal daydreams, we experience a great pleasure, and one which probably arises from the confluence of many sources. How the writer accomplishes this is his innermost secret;

the essential *ars poetica* lies in the technique of overcoming the feeling of repulsion in us which is undoubtedly connected with the barriers that rise between each single ego and the others. We can guess two of the methods used by this technique. The writer softens the character of his egoistic daydreams by altering and disguising it, and he bribes us by the purely formal – that is, aesthetic – yield of pleasure which he offers us in the presentation of his phantasies. We give the name of an *incentive bonus*, or a *fore-pleasure*, to a yield of pleasure such as this, which is offered to us so as to make possible the release of still greater pleasure arising from deeper psychical sources.[1] In my opinion, all the aesthetic pleasure which a creative writer affords us has the character of a fore-pleasure of this kind, and our actual enjoyment of an imaginative work proceeds from a liberation of tensions in our minds. It may even be that not a little of this effect is due to the writer's enabling us thenceforward to enjoy our own daydreams without self-reproach or shame. This brings us to the threshold of new, interesting and complicated enquiries; but also, at least for the moment, to the end of our discussion.

1 [This theory of 'fore-pleasure' and the 'incentive bonus' had been applied by Freud to jokes in Chapter IV of his book on that subject (1905*c*), *RSE*, **8**, 120 f. The nature of 'fore-pleasure' was also discussed in the *Three Essays* (1905*d*). See especially ibid., **7**, 184 ff. Cf. also Freud's *Autobiographical Study* (1925*d*), ibid., **20**, 56–7, and 'Psychopathic Characters on the Stage' (1942*a* [1905–06]), ibid., **7**, 300.]

HYSTERICAL PHANTASIES AND THEIR RELATION TO BISEXUALITY

(1908)

2004 *PMC*, *Studies in Hysteria*, 307–14. (Tr. Nicola Luckhurst.)

The present translation is a revised and corrected reprint of the *SE* version.

This paper was originally intended for Hirschfeld's *Jahrbuch für sexuelle Zwischenstufen*, but was transferred to a new periodical just started by the same editor. The importance of phantasies as the basis of hysterical symptoms had been first recognized by Freud in about the year 1897, in connection with his self-analysis. But though he communicated his findings privately to Fliess (see, for instance, his letters of July 7 and September 21, 1897: Freud, 1950*a*, Letters 66 and 69), he had only published them fully a couple of years before the present paper was written. (See Freud, 1906*a*; *RSE*, **7**, 283–4.) The main part of this paper is a further discussion of the relation between phantasies and symptoms; and, in spite of its title, the subject of bisexuality emerges [158] almost as an afterthought. It may be remarked, incidentally, that the subject of phantasies seems to have been very much in Freud's mind at about the date of this paper. They are further discussed in the papers on 'The Sexual Theories of Children' (p. 183 ff. below), on 'Family Romances' (p. 211 ff.), on 'Creative Writers and Daydreaming' (p. 123 ff.), and on 'Hysterical Attacks' (p. 201 ff.), as well as at many points in the study of *Gradiva* (e.g. pp. 39–41). Much of the material of the present paper had, of course, been anticipated. See, for instance, the 'Dora' analysis (1905*e* [1901]), *RSE*, **7**, 42–7, and the *Three Essays* (1905*d*), ibid., **7**, 147–8.

HYSTERICAL PHANTASIES AND THEIR RELATION TO BISEXUALITY

We are all familiar with the delusional imaginings of the paranoic, [159] which are concerned with the greatness and the sufferings of his own self [*Ichs*][T] and which appear in forms that are quite typical and almost monotonous. We have also become acquainted, through numerous accounts, with the strange performances with which certain perverts stage their sexual satisfaction, whether in idea or reality. Nevertheless, it may be new to some readers to hear that quite analogous psychical structures are regularly present in all the psychoneuroses, particularly in hysteria, and that these latter – which are known as hysterical phantasies [*Phantasien*][T] – can be seen to have important connections with the causation of the neurotic symptoms.

A common source and normal prototype of all these creations of phantasy is to be found in what are called the daydreams of youth. These have already received some, though as yet insufficient, notice in the literature of the subject.[1] They occur with perhaps equal frequency in both sexes, though it seems that, while in girls and women they are invariably of an erotic nature, in men they may be either erotic or ambitious. Nevertheless, the importance of the erotic factor in men, too, should not be given a secondary rating; a closer investigation of a man's daydreams generally shows that all his heroic exploits are carried out and all his successes achieved only in order to please a woman and to be preferred by her to other men.[2] These phantasies are satisfactions of wishes proceeding from deprivation and longing. They are justly called 'daydreams', for they give us the key to an understanding of night dreams [160] – in which the nucleus of the dream formation [*Traumbildung*][T] consists *Bildung* of nothing else than complicated daytime phantasies of this kind that

1 Cf. Breuer & Freud (1895*d*), Pierre Janet (1898, **1**), Havelock Ellis (1899*b*), Freud (1900*a*), Pick (1896).

2 Havelock Ellis (1899*b*) is of the same opinion.

have been distorted and are misunderstood by the conscious psychical agency.[1]

Besetzung These daydreams are cathected [*besetzt*][T] with a large amount of interest; they are carefully cherished by the subject and usually concealed with a great deal of sensitivity, as though they were among the most intimate possessions of his personality. It is easy to recognize a person who is absorbed in daydreaming in the street, however, by his sudden, as it were absent-minded, smile, his way of talking to himself, or by the hastening of his steps which marks the climax of the imagined situation. Every hysterical attack which I have been able to investigate up to the present has proved to be an involuntary irruption of daydreams of this kind. For our observations no longer leave any room for doubt that such phantasies may be unconscious just as well as conscious; and as soon as the latter have become unconscious they may also become pathogenic – that is, they may express themselves in symptoms and attacks. In favourable circumstances, the subject can still capture an unconscious phantasy of this sort in consciousness. After I had drawn the attention of one of my patients to her phantasies, she told me that on one occasion she had suddenly found herself in tears in the street and that, rapidly considering what it was she was actually crying about, she had got hold of a phantasy to the following effect. In her imagination she had formed a tender attachment to a pianist who was well known in the town (though she was not personally acquainted with him); she had had a child by him (she was, in fact, childless); and he had then deserted her and her child and left them in poverty. It was at this point in her romance that she had burst into tears.

[161] Unconscious phantasies have either been unconscious all along and have been formed in the unconscious; or – as is more often the case – they were once conscious phantasies, daydreams, and have since been purposely forgotten and have become unconscious through 'repression' ['*Verdrängung*'][T]. Their content may afterwards either have remained the same or have undergone alterations, so that the present unconscious phantasies are derivatives of the once conscious ones. Now an unconscious phantasy has a very important connection with the subject's sexual life; for it is identical to the phantasy which served to give him sexual satisfaction during a period of masturbation. At that time the masturbatory act (in the widest sense of the term[2]) was compounded of

1 Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 439 ff. – [The contents of this paragraph had been stated more fully by Freud in his almost contemporary paper 'Creative Writers and Daydreaming' (1908*e*), p. 126 f. above.]

2 [I.e. not in its restricted literal sense of manual friction.]

two parts. One was the evocation of a phantasy and the other some active behaviour for obtaining self-gratification at the height of the phantasy. This compound, as we know, was itself merely soldered together.[1] Originally the action was a purely auto-erotic procedure for the purpose of obtaining pleasure from some particular part of the body, which could be described as erotogenic. Later, this action became merged with a wishful idea from the sphere of object love and served as a partial realization of the situation in which the phantasy culminated. When, subsequently, the subject renounces this type of satisfaction, composed of masturbation and phantasy, the action is given up, while the phantasy, from being conscious, becomes unconscious. If no other mode of sexual satisfaction supervenes, the subject remains abstinent; and if he does not succeed in sublimating his libido – that is, in deflecting his sexual excitation to higher aims – the condition is now fulfilled for his unconscious phantasy to be revived and to proliferate, and, at least as regards some part of its content, to put itself into effect, with the whole force of his need for love, in the form of a pathological symptom.

In this way, unconscious phantasies are the immediate psychical precursors to a whole number of hysterical symptoms. Hysterical symptoms [162]
are nothing other than unconscious phantasies brought into view through 'conversion'; and insofar as the symptoms are somatic ones, they are often enough taken from the circle of the same sexual sensations and motor innervations as those which had originally accompanied the phantasy when it was still conscious. In this way the giving up of the habit of masturbation is in fact undone, and the purpose of the whole pathological process, which is a restoration of the original, primary sexual satisfaction, is achieved – though never completely, it is true, but always in a sort of approximation.

Anyone who studies hysteria, therefore, soon finds his interest turned away from its symptoms to the phantasies from which they proceed. The technique of psychoanalysis enables us in the first place to infer from the symptoms what those unconscious phantasies are and then to make them conscious to the patient. By this means it has been found that the content of the hysteric's unconscious phantasies corresponds completely to the situations in which satisfaction is consciously obtained by perverts; and if anyone is at a loss for examples of such situations he has only to recall the world-famous performances of the Roman emperors, the wild excesses of which were, of course, determined only by the enormous and unrestrained sense of power [*Machtfülle*][T] *Macht*

1 Cf. Freud, *Three Essays* (1905*d*) [*RSE*, **7**, 132].

possessed by the authors of the phantasies. The delusions of paranoics are phantasies of the same nature, though they are phantasies which have become directly conscious. They rest on the sadomasochistic components of the sexual drive [*Sexualtriebes*][T], and they, too, may find their complete counterpart in certain unconscious phantasies of hysterical subjects. We also know of cases – cases which have their practical importance as well – in which hysterics do not give expression to their phantasies in the form of symptoms but as conscious realizations, and in that way devise and stage assaults, attacks or acts of sexual aggression.

Trieb

This method of psychoanalytic investigation, which leads from the conspicuous symptoms to the hidden unconscious phantasies, tells us [163] everything that can be known about the sexuality of psychoneurotics, including the fact which is to be the main subject matter of this short preliminary publication.

Owing, probably, to the difficulties which the unconscious phantasies meet with in their endeavour to find expression, the relationship of the phantasies to the symptoms is not simple, but on the contrary, complicated in many ways.[1] As a rule – when, that is, the neurosis is fully developed and has persisted for some time – a particular symptom corresponds, not to a single unconscious phantasy, but to several such phantasies; and it does so not in an arbitrary manner but in accordance with a regular pattern. At the beginning of the illness these complications are, no doubt, not all fully developed.

For the sake of general interest I will at this point go outside the framework of this paper and interpolate a series of formulas which attempt to give a progressively fuller description of the nature of hysterical symptoms. These formulas do not contradict one another, but some represent an increasingly complete and precise approach to the facts, while others represent the application of different points of view:

(1) Hysterical symptoms are mnemic symbols[2] of certain operative (traumatic) impressions and experiences.

(2) Hysterical symptoms are substitutes, produced by 'conversion', for the associative return of these traumatic experiences.

(3) Hysterical symptoms are – like other psychical structures [*Bildungen*][T] – an expression of the fulfilment of a wish.

1 The same is true of the relation between the 'latent' dream thoughts and the elements of the 'manifest' content of a dream. See the section of my *Interpretation of Dreams* [Chapter VI] which deals with the 'dream-work'.

2 [The term was used by Freud extensively in the *Studies on Hysteria* (1895*d*), *RSE*, **2**; it is explained at some length in the first of his *Five Lectures* (1910*a*), ibid., **11**, 17–18.]

(4) Hysterical symptoms are the realization of an unconscious phantasy which serves the fulfilment of a wish.

(5) Hysterical symptoms serve the purpose of sexual satisfaction and [164]
represent a portion of the subject's sexual life (a portion which corresponds to one of the constituents of his sexual drive).

(6) Hysterical symptoms correspond to a return of a mode of sexual satisfaction which was a real one in infantile life and has since been repressed.

(7) Hysterical symptoms arise as a compromise between two opposite affective and drive impulses [*Triebregungen*][T], of which one is attempting to bring to expression a component drive or a constituent of the sexual constitution, and the other is attempting to suppress it.[1] *Regung*

(8) Hysterical symptoms may take over the representation of various unconscious impulses which are not sexual, but they can never be without a sexual significance.

Among these various definitions the seventh brings out the nature of hysterical symptoms most completely as the realization of an unconscious phantasy; and the eighth recognizes the proper significance of the sexual factor. Some of the preceding formulas lead up to these two and are contained in them.

This connection between symptoms and phantasies makes it easy to arrive from a psychoanalysis of the former at a knowledge of the components of the sexual drives which dominate the individual, as I have demonstrated in my *Three Essays on the Theory of Sexuality* [1905*d*; *RSE*, 7]. In some cases, however, investigation by this means yields an unexpected result. It shows that there are many symptoms where the uncovering of a sexual phantasy (or of a number of phantasies, one of which, the most significant and the earliest, is of a sexual nature) is not enough to bring about a resolution of the symptoms. To resolve it one has to have *two* sexual phantasies, of which one has a masculine and the other a feminine character. Thus one of these phantasies springs from a homosexual impulse. This new finding does not alter our seventh formula. It remains true that a hysterical symptom must necessarily [165]
represent a compromise between a libidinal and a repressing impulse; but it may also represent a union of two libidinal phantasies of an opposite sexual character.

I shall refrain from giving examples in support of this thesis. I have

1 [This had already been expressed by Freud in the first edition of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 509, and earlier still in a letter to Fliess of May 30, 1896 (Freud, 1950*a*, Letter 46).]

found from experience that short analyses, condensed into extracts, can never have the convincing effect which they are designed to produce. And on the other hand, accounts of fully analysed cases must be left for another occasion.

I will therefore content myself with stating the following formula and explaining its significance:

(9) Hysterical symptoms are the expression, on the one hand, of a masculine unconscious sexual phantasy, and, on the other hand, of a feminine one.

I must expressly state that I cannot claim the same general validity for this formula as I have done for the others. As far as I can see, it applies neither to all the symptoms of a given case nor to all cases. On the contrary, it is not hard to adduce cases in which the impulses belonging to the opposite sexes have found separate symptomatic expression, so that the symptoms of heterosexuality and those of homosexuality can be as clearly distinguished from each other as the phantasies concealed behind them. Nevertheless, the condition of things stated in the ninth formula is common enough, and, when it occurs, important enough to deserve special emphasis. It seems to me to mark the highest degree of complexity to which the determination of a hysterical symptom can attain, and one may therefore only expect to find it in a neurosis which has persisted for a long time and within which a great deal of organization has taken place.[1]

The bisexual nature of hysterical symptoms, which can in any event be demonstrated in numerous cases, is an interesting confirmation of
[166] my view that the postulated existence of an innate bisexual disposition in man is especially clearly visible in the analysis of psychoneurotics.[2] An exactly analogous state of affairs occurs in the same field when a person who is masturbating tries in his conscious phantasies to have the feelings both of the man and of the woman in the situation which he is picturing. Further counterparts are to be found in certain hysterical attacks in which the patient simultaneously plays both parts in the underlying sexual phantasy. In one case which I observed, for instance, the patient pressed her dress up against her body with one hand (as the woman), while she tried to tear it off with the other (as the man).[3] This simultaneity of contradictory actions serves to a large extent to obscure the

1 Sadger (1907) has recently discovered this formula independently in his own psychoanalyses. He, however, maintains that it has general validity.

2 Cf. my *Three Essays* [e.g. in *RSE*, **7**, 148 and 194].

3 [This case is mentioned again in a later paper (p. 202 below).]

situation, which is otherwise so plastically portrayed in the attack, and it is thus well suited to conceal the unconscious phantasy that is at work.

In psychoanalytic treatment it is very important to be prepared for a symptom's having a bisexual meaning. We need not then be surprised or misled if a symptom seems to persist undiminished although we have already resolved one of its sexual meanings; for it is still being maintained by the – perhaps unsuspected – one belonging to the opposite sex. In the treatment of such cases, moreover, one may observe how the patient avails himself, during the analysis of the one sexual meaning, of the convenient possibility of constantly switching his associations [*Einfällen*][T], as though on to an adjoining track, into the field of the contrary meaning.

CHARACTER AND ANAL EROTISM

The present translation is a revised and corrected reprint of the *SE* version.

The theme of this paper has now become so familiar that it is difficult to realize the astonishment and indignation which it aroused on its first publication. The three character traits which are here associated with anal erotism had, as we know from Ernest Jones (1955, 331–2), already been mentioned by Freud in a letter to Jung of October 27, 1906. He had also mentioned them in some remarks to the Vienna Psychoanalytical Society on March 6, 1907. (See the *Minutes*, **1**.) He had associated money and miserliness with faeces in a letter to Fliess of December 22, 1897 (Freud, 1950*a*, Letter 79). The paper was no doubt partly stimulated by the analysis of the 'Rat Man' (1909*d*), *RSE*, **7**, which had been concluded shortly before, though the special connection between anal erotism and obsessional neurosis was only brought out some years later, in 'The Disposition to Obsessional Neurosis' (1913*i*), ibid., **12**. Another case history, that of the 'Wolf Man' (1918*b* [1914]), ibid., **17**, led to a further expansion of the topic which is dealt with here – the paper 'On Transformations of Drive' (1916–17*e*), ibid., **17**.

CHARACTER AND ANAL EROTISM

Among those whom we try to help by our psychoanalytic efforts we often come across a type of person who is marked by the possession of a certain set of character traits, while at the same time our attention is drawn to the behaviour in his childhood of one of his bodily functions and the organ concerned in it. I cannot say at this date what particular occasions began to give me an impression that there was some organic connection between this type of character and this behaviour of an organ, but I can assure the reader that no theoretical expectation played any part in that impression. [169]

Accumulated experience has so much strengthened my belief in the existence of such a connection that I am venturing to make it the subject of a communication.

The people I am about to describe are noteworthy for a regular combination of the three following characteristics. They are especially *orderly*, *parsimonious* and *obstinate*. Each of these words actually covers a small group or series of interrelated character traits. 'Orderly'[1] covers the notion of bodily cleanliness, as well as of conscientiousness in carrying out small duties and trustworthiness. Its opposite would be 'untidy' [*unordentlich*] and 'neglectful' [*nachlässig*]. Parsimony [*Sparsamkeit*] may appear in the exaggerated form of avarice; and obstinacy [*Eigensinn*] can go over into defiance, to which rage and revengefulness are easily joined. The two latter qualities – parsimony and obstinacy – are linked with each other more closely than they are with the first – with orderliness. They are, also, the more constant element of the whole complex. Yet it seems to me incontestable that all three in some way belong together.

It is easy to gather from these people's early childhood history that they took a comparatively long time to overcome their infantile [170]

1 ['*Ordentlich*' in German. The original meaning of the word is 'orderly'; but it has become greatly extended in use. It can be the equivalent of such English terms as 'correct', 'tidy', 'cleanly', 'trustworthy', as well as 'regular', 'decent' and 'proper', in the more colloquial senses of those words.]

incontinentia alvi [faecal incontinence], and that even in later childhood they suffered from isolated failures of this function. As infants, they seem to have belonged to the class who refuse to empty their bowels when they are put on the pot because they derive a subsidiary pleasure
Lust [*Lustnebengewinn*][T] from defaecating;[1] for they tell us that even in somewhat later years they enjoyed holding back their stool, and they remember – though more readily about their brothers and sisters than about themselves – doing all sorts of unseemly things with the faeces that had been passed. From these indications we infer that such people are born with a sexual constitution in which the erotogenicity of the anal zone is exceptionally strong. But since none of these weaknesses and idiosyncrasies is to be found in them once their childhood has been passed, we must conclude that the anal zone had lost its erotogenic significance in the course of development; and it is to be suspected that the regularity with which this triad of properties is present in their character may be brought into relation with the disappearance of their anal erotism.

I know that no-one is prepared to believe in a state of things so long as it appears to be unintelligible and to offer no angle from which an explanation can be attempted. But we can at least bring the underlying factors nearer to our understanding by the help of the postulates I laid down in my *Three Essays on the Theory of Sexuality* in 1905.[2] I there
Trieb attempted to show that the sexual drive [*Sexualtrieb*][T] of man is highly complex and is put together from contributions made by numerous constituents and component drives. Important contributions to 'sexual
Erregung excitation' ['*Sexualerregung*'][T] are furnished by the peripheral excita-
[171] tions of certain specially designated parts of the body (the genitals, mouth, anus, urethra), which therefore deserve to be described as 'erotogenic zones'. But the amounts of excitation coming in from these parts of the body do not all undergo the same vicissitudes [*Schicksal*][T], nor is the fate of all of them the same at every period of life. Generally speaking, only a part of them is made use of in sexual life; another part is deflected from sexual aims and directed towards others – a process which deserves the name of 'sublimation'. During the period of life which may be called the period of 'sexual latency' – i.e. from the completion of the fifth year[3] to the first manifestations of puberty (round about

1 Cf. Freud, *Three Essays on the Theory of Sexuality* (1905*d*) [*RSE*, 7, 165].

2 [The material in the present paragraph is derived mainly from Section 5 of the first essay and Section 1 of the second (ibid., 7, 149 ff. and 157 ff.).]

3 [In the German editions before 1924 this read 'from the completion of the fourth year'.]

the eleventh year) – reaction-formations [*Reaktionsbildungen*][T], or counterforces, such as shame, disgust and morality, are created in the mind. They are actually formed at the expense of the excitations proceeding from the erotogenic zones, and they rise like dams to oppose the later activity of the sexual drives. Now anal erotism is one of the components of the [sexual] drive which, in the course of development and in accordance with the education demanded by our present civilization [*Kulturerziehung*][T], have become unserviceable for sexual aims. It is therefore plausible to suppose that these character traits of orderliness, parsimony and obstinacy, which are so often prominent in people who were formerly anal erotics, are to be regarded as the first and most constant results of the sublimation of anal erotism.[1]

Bildung

Kultur

The intrinsic necessity for this connection is not clear, of course, even to myself. But I can make some suggestions which may help towards an understanding of it. Cleanliness, orderliness and trustworthiness give [172]

1 Since it is precisely the remarks in my *Three Essays on the Theory of Sexuality* about the anal erotism of infants that have particularly scandalized uncomprehending readers, I venture at this point to interpolate an observation for which I have to thank a very intelligent patient. 'A friend of mine', he told me, 'who has read your *Three Essays on the Theory of Sexuality*, was talking about the book. He entirely agreed with it, but there was one passage, which – though of course he accepted and understood its meaning like that of the rest – struck him as so grotesque and comic that he sat down and laughed over it for a quarter of an hour. This passage ran: "One of the clearest signs of subsequent eccentricity or nervousness is to be seen when a baby obstinately refuses to empty his bowels when he is put on the pot – that is, when his nurse wants him to – and holds back that function till he himself chooses to exercise it. He is naturally not concerned with dirtying the bed, he is only anxious not to miss the subsidiary pleasure attached to defaecating." [*RSE*, **7**, 165.] The picture of this baby sitting on the pot and deliberating whether he would put up with a restriction of this kind upon his personal freedom of will, and feeling anxious, too, not to miss the pleasure attached to defaecating – this caused my friend the most intense amusement. About twenty minutes afterwards, as we were having some cocoa, he suddenly remarked without any preliminary: "I say, seeing the cocoa in front of me has suddenly made me think of an idea that I always had when I was a child. I used always to pretend to myself that I was the cocoa manufacturer Van Houten" (he pronounced the name Van "Hauten" [i.e. with the first syllable rhyming with the English word 'cow']) "and that I possessed a great secret for the manufacture of this cocoa. Everybody was trying to get hold of this secret that was a boon to humanity but I kept it carefully to myself. I don't know why I should have hit specially upon Van Houten. Probably his advertisements impressed me more than any others." Laughing, and without thinking at the time that my words had any deep meaning, I said: "Wann haut'n die Mutter?" ['When does mother smack?' The first two words in the German phrase are pronounced exactly like 'Van Houten'.] It was only later that I realized that my pun, in fact, contained the key to the whole of my friend's sudden childhood recollection, and I then recognized it as a brilliant example of a screen phantasy [*Deckphantasie*][T]. My friend's phantasy, while keeping to the situation actually involved (the nutritional process) and making use of phonetic associations ("Kakao" ['cocoa'. – 'Kaka' is the common German nursery word for 'faeces' – cf. a dream in Section IX of Freud, 1923*c*; ibid., **19**, 108–9] and "Wann haut'n"), pacified his sense of guilt by making a complete reversal in the content of his recollection: there was a displacement from the back of the body to the front, excreting food became taking food in, and something that was shameful and had to be concealed became a secret that was a boon to humanity. I was interested to see how, only a quarter of an hour after my friend had fended the phantasy off [*Abwehr hin*][T] (though, it is true, in the comparatively mild form of raising an objection on formal grounds), he was, quite involuntarily, presented with the most convincing evidence by his own unconscious.'

Deckerinnerung

Abwehr

exactly the impression of a reaction-formation against an interest in what is unclean and disturbing and should not be part of the body.
[173] ('Dirt is matter in the wrong place.')[1] To relate obstinacy to an interest in defaecation would seem no easy task; but it should be remembered that even babies can show self-will about parting with their stool, as we have seen above [p. 150], and that it is a general practice in children's upbringing to administer painful stimuli to the skin of the buttocks – which is linked up with the erotogenic anal zone – in order to break their obstinacy and make them submissive. An invitation to a caress of the anal zone is still used today, as it was in ancient times, to express defiance or defiant scorn, and thus in reality signifies an act of tenderness that has been overtaken by repression. An exposure of the buttocks represents a softening down of this spoken invitation into a gesture; in Goethe's *Götz von Berlichingen* both words and gesture are introduced at the most appropriate point as an expression of defiance.[2]

The connections between the complexes of interest in money and of defaecation, which seem so dissimilar, appear to be the most extensive of all. Every doctor who has practised psychoanalysis knows that the most refractory and long-standing cases of what is described as habitual constipation in neurotics can be cured by that form of treatment. This is less surprising if we remember that that function has shown itself similarly amenable to hypnotic suggestion. But in psychoanalysis one only achieves this result if one deals with the patients' money complex and induces them to bring it into consciousness with all its connections. It might be supposed that the neurosis is here only following an indication of common usage in speech, which calls a person who keeps too
[174] careful a hold on his money 'dirty' or 'filthy'.[3] But this explanation would be far too superficial. In reality, wherever archaic modes of thought have predominated or persist – in the ancient civilizations, in myths, fairy tales and superstitions, in unconscious thinking, in dreams and in neuroses – money is brought into the most intimate relationship with dirt. We know that the gold which the Devil gives his paramours turns into excrement after his departure, and the Devil is certainly nothing else than the personification of the repressed unconscious life

1 [This sentence is in English in the original.]

2 [The scene occurs in Act III, when Götz is summoned by a herald to surrender. In the later acting version of the play the words and gestures are toned down.]

3 [The English 'filthy' as well as the German '*filzig*' appears in the original. Freud had already commented on the usage mentioned here, in a letter to Fliess of December 22, 1897 (Freud, 1950*a*, Letter 79) and, later, in the first edition of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 177.]

of the drives.[1] We also know about the superstition which connects the finding of treasure with defaecation,[2] and everyone is familiar with the figure of the 'shitter of ducats [*Dukatenscheisser*]'.[3] Indeed, even according to ancient Babylonian doctrine gold is 'the faeces of Hell' (Mammon = *ilu manman*[4]). Thus in following the usage of language, neurosis, here as elsewhere, is taking words in their original, significant sense, and where it appears to be using a word figuratively it is usually simply restoring its old meaning.[5]

It is possible that the contrast between the most precious substance known to men and the most worthless, which they reject as waste matter ('refuse'[6]), has led to this specific identification of gold with faeces.

Yet another circumstance facilitates this equation in neurotic thought. [175]
The original erotic interest in defaecation is, as we know, destined to be extinguished in later years. In those years the interest in money makes its appearance as a new interest which had been absent in childhood. This makes it easier for the earlier impulsion, which is in the process of losing its aim, to be carried over to the newly emerging aim.

If there is any basis in fact for the relation posited here between anal erotism and this triad of character traits, one may expect to find no very marked degree of 'anal character' in people who have retained the anal zone's erotogenic character in adult life, as happens, for instance, with certain homosexuals. Unless I am much mistaken, the evidence of experience tallies quite well on the whole with this inference.

We ought in general to consider whether other character complexes, too, do not exhibit a connection with the excitations of particular erotogenic zones. At present I only know of the intense 'burning'

1 Compare hysterical possession and demoniac epidemics. [Freud discussed this at considerable length in Part III of his paper 'A Seventeenth-Century Demonological Neurosis' (1923*d*), *RSE*, **19**, 74 ff. The legendary transformation of witches' gold into faeces and the comparison with the '*Dukatenscheisser*' below had already been mentioned by Freud in a letter to Fliess of January 24, 1897 (1950*a*, Letter 57).]

2 [Numerous examples of this derived from folklore are given in Freud & Oppenheim's paper on 'Dreams in Folklore' (1958*a* [1911]), *RSE*, **12**, 185 ff.]

3 [A term vulgarly used for a wealthy spendthrift.]

4 Cf. Jeremias [1904*a*], *Das alte Testament im Lichte des alten Orients*, 2nd ed., 1906, p. 216, and *Babylonisches im Neuen Testament*, 1905, p. 96: '"Mamon" ("Mammon") is "Manman" in Babylonian and is another name for Nergal, the God of the Underworld. According to Oriental mythology, which has passed over into popular legends and fairy tales, gold is the excrement of Hell.' Cf. *Monotheistische Strömungen innerhalb der babylonischen Religion* [1904*b*], p. 16 *n.* 1.

5 [For the occurrence of this in dreams, see a passage added in 1909 to *The Interpretation of Dreams*, *RSE*, **5**, 363 f.]

6 [In English in the original.]

ambition of people who earlier suffered from enuresis.[1] We can at any rate lay down a formula for the way in which character in its final shape is formed out of the constituent drives: the permanent character traits are either unchanged prolongations of the original drives, or sublimations of those drives, or reaction-formations against them.[2]

1 [The connection between urethral erotism and ambition seems to find its first mention here. Freud occasionally returned to the point, e.g. in a sentence added in 1914 to *The Interpretation of Dreams*, *RSE*, **4**, 191, and in a footnote added in 1920 to the *Three Essays* (1905*d*), ibid., **7**, 211 *n.* 1. In a long footnote to Chapter III of *Civilization and its Discontents* (1930*a*), ibid., **21**, 82–3 *n.* 3, he brought the present finding into connection with his two other main lines of thought concerning enuresis – its symbolic association with fire and its importance as an infantile equivalent of masturbation. See also the still later paper on 'The Acquisition and Control of Fire' (1932*a*), ibid., **22**, 201 ff.]

2 [There are not many accounts by Freud of the nature of 'character' and the mechanism of its formation. Among them may be mentioned a passage in the *Three Essays* (1905*d*), ibid., **7**, 211, some remarks in the paper on 'The Disposition to Obsessional Neurosis' (1913*i*), ibid., **12**, 318–19, and especially a discussion in Chapter III of *The Ego and the Id* (1923*b*), ibid., **19**, 24–7, the gist of which is repeated in Lecture XXXII of the *New Introductory Lectures* (1933*a*), ibid., **22**, 80 ff.]

Sexual-Probleme, the periodical in which this and the following paper (p. 181 below) appeared, was a continuation of the journal *Mutterschutz*, under which title it is sometimes catalogued. The numbering of the volumes continued unbroken in spite of the change of title.

Though this was the earliest of Freud's full-length discussions of the antagonism between civilization and the life of the drives, his convictions on the subject went back much further. For instance, in a memorandum sent to Fliess on May 31, 1897, he [180] wrote that 'incest is antisocial – civilization consists in this progressive renunciation'. (Freud, 1950*a*, Draft N.)[1] But, indeed, this antagonism was implied in his

1 See also some passages in the paper on 'Sexuality in the Aetiology of the Neuroses' (1898*a*), *RSE*, **3**; and, in particular, a discussion in it of the problem of contraceptives which anticipates the remarks on p. 169 below.

whole theory of the impact of the latency period on the development of human sexuality, and in the last pages of his *Three Essays* (1905*d*) he spoke of 'the inverse relation holding between civilization and the free development of sexuality' (*RSE*, **7**, 214). Much of the present paper, it may be remarked, summarizes the findings of this last-mentioned work, which had first appeared only three years previously.

The sociological aspects of that antagonism form the main subject of the present paper, and Freud often returned to it in the course of his later writings. Thus, leaving out of account the many passing allusions to it, we may mention the last two sections of the second of his papers on the psychology of love (1912*d*), ibid., **11**, 171 ff., the opening pages of *The Future of an Illusion* (1927*c*), ibid., **21**, and the closing paragraphs of the open letter to Einstein *Why War?* (1933*b*), ibid., **22**. But his longest and most elaborate discussion of the subject was, of course, in *Civilization and its Discontents* (1930*a*), ibid., **21**.

The ancient problem of whether the German word '*Kultur*' is to be translated 'culture' or 'civilization' has been solved here by the choice sometimes of the one and sometimes of the other. The translators have, indeed, been given a free hand by a remark of Freud's in the third paragraph of *The Future of an Illusion*: 'I scorn to distinguish between culture and civilization.' For a full discussion of this issue, see ibid., **24**, 74.

'CIVILIZED' SEXUAL MORALITY AND MODERN NERVOUS ILLNESS

In his recently published book, *Sexual Ethics*, Von Ehrenfels[1] (1907) dwells on the difference between 'natural' and 'civilized' ['*kulturellen*'][T] sexual morality. By natural sexual morality we are to understand, according to him, a sexual morality under whose dominance a human stock is able to remain in lasting possession of health and efficiency, while civilized sexual morality is a sexual morality obedience to which, on the other hand, spurs men on to intense and productive *cultural* activity [*Kulturarbeit*]. This contrast, he thinks, is best illustrated by comparing the *innate* character of a people with their cultural attainments. I may refer the reader to Von Ehrenfels's own work for a more extensive consideration of this significant line of thought, and I shall extract from it here only as much as I need as a starting point for my own contribution to the subject. [181] *Kultur*

It is not difficult to suppose that under the domination of a civilized sexual morality the health and efficiency of single individuals may be liable to impairment and that ultimately this injury to them, caused by the sacrifices imposed on them, may reach such a pitch that, by this indirect path, the cultural aim in view will be endangered as well. And Von Ehrenfels does, in fact, attribute a number of ill-effects to the sexual morality which dominates our Western society today, ill-effects for which he is obliged to make that morality responsible; and, although he fully acknowledges its high aptitude for the furtherance of civilization, he is led to convict it of standing in need of reform. In his view, what is characteristic of the civilized sexual morality that dominates us is that the demands made on women are carried over [*Übertragung*] to the sexual life [*Geschlechtsleben*][T] of men and that all sexual intercourse [*Sexualverkehres*] is prohibited except in monogamous marriage. Nevertheless, consideration of the natural difference between the sexes makes it necessary to visit men's lapses with less severity and thus, in fact, to admit a *double* morality for them. But a society which accepts [182] *Geschlecht*

1 [See footnote, p. 177 below.]

this double morality cannot carry 'the love of truth, honesty and humanity' (Von Ehrenfels, ibid., 32 ff.) beyond a definite and narrow limit, and is bound to induce in its members concealment of the truth, false optimism, self-deception and deception of others. And civilized sexual morality has still worse effects, for, by glorifying monogamy, it cripples the factor of *selection by virility* – the factor whose influence alone can bring about an improvement of the individual's innate constitution, since in civilized peoples *selection by vitality* has been reduced to a minimum by humanity and hygiene (ibid., 35).

Among the damaging effects which are here laid at the door of civilized sexual morality, the physician will miss a particular one whose significance will be discussed in detail in the present paper. I refer to the increase traceable to it of modern nervous illness – of the nervous illness, that is, which is rapidly spreading in our present-day society. Occasionally a nervous patient will himself draw the doctor's attention to the part played in the causation of his complaint by the opposition between his constitution and the demands of civilization and will say: 'In our family we've all become neurotic because we wanted to be something better than what, with our origin, we are capable of being.' Often, too, the physician finds food for thought in observing that those who succumb to nervous illness are precisely the offspring of fathers who, having been born of rough but vigorous families, living in simple, healthy, country conditions, had successfully established themselves in the metropolis, and in a short space of time had brought their children to a high level of culture. But, above all, nerve specialists themselves have loudly proclaimed the connection between 'increasing nervous illness' and modern civilized life. The grounds to which they attribute this connection will be shown by a few extracts from statements that have been made by some eminent observers.

[183] W. Erb (1893): 'The original question, then, is whether the causes of nervous illness that have been put before you are present in modern life to such a heightened degree as to account for a marked increase in that form of illness. The question can be answered without hesitation in the affirmative, as a cursory glance at our present-day existence and its features will show.

'This is already clearly demonstrated by a number of general facts. The extraordinary achievements of modern times, the discoveries and inventions in every sphere, the maintenance of progress in the face of increasing competition – these things have only been gained, and can only be held, by great mental effort. The demands made on the efficiency

of the individual in the struggle for existence have greatly increased and it is only by putting out all his mental powers that he can meet them. At the same time, the individual's needs and his demands for the enjoyments of life have increased in all classes; unprecedented luxury has spread to strata of the population who were formerly quite untouched by it; irreligion, discontent and covetousness have grown up in wide social spheres. The immense extension of communications which has been brought about by the network of telegraphs and telephones that encircle the world has completely altered the conditions of trade and commerce. All is hurry and agitation; night is used for travel, day for business, even "holiday trips" have become a strain on the nervous system. Important political, industrial and financial crises carry excitement into far wider circles of people than they used to do; political life is engaged in quite generally; political, religious and social struggles, party politics, electioneering and the enormous spread of trade unionism inflame tempers, place an ever greater strain on the mind, and encroach upon the hours for recreation, sleep and rest. City life is constantly becoming more sophisticated and more restless. The exhausted nerves seek recuperation in increased stimulation and in highly spiced pleasures, only to become more exhausted than before. Modern literature is predominantly concerned with the most questionable problems which [184] stir up all the passions, and which encourage sensuality and a craving for pleasure, and contempt for every fundamental ethical principle and every ideal. It brings before the reader's mind pathological figures and problems concerned with psychopathic[1] sexuality, and revolutionary and other subjects. Our ears are excited and overstimulated by large doses of noisy and insistent music. The theatres captivate all our senses with their exciting performances. The plastic arts, too, turn by preference to what is repellent, ugly and suggestive, and do not hesitate to set before our eyes with revolting fidelity the most horrible sights that reality has to offer.

'This general description is already enough to indicate a number of dangers presented by the evolution of our modern civilization. Let me now fill in the picture with a few details.'

Binswanger (1896): 'Neurasthenia in particular has been described as an essentially modern disorder, and Beard, to whom we are indebted for a first comprehensive account of it,[2] believed that he had discovered a

1 [*psychopatisch*, i.e. 'psychopathological' in contemporary usage.]

2 [Cf. Beard, 1881 and 1884. G. M. Beard (1839–83) was an American neurologist. Freud mentioned his work in some of his earlier discussions of neurasthenia (Freud, 1895*b* and 1896*a*; *RSE*, **3**) and in a letter to Fliess of November 5, 1897 (Freud, 1950*a*, Letter 74).]

new nervous disease which had developed specifically on American soil. This supposition was of course a mistaken one; nevertheless, the fact that it was an *American* physician who was first able to grasp and describe the peculiar features of this illness, as the fruit of a wide experience, indicates, no doubt, the close connections which exist between it and modern life, with its unbridled pursuit of money and possessions, and its immense advances in the field of technology which have rendered illusory every obstacle, whether temporal or spatial, to our means of intercommunication.'

Von Krafft-Ebing (1895*b*, 11): 'The mode of life of countless civilized people exhibits nowadays an abundance of anti-hygienic factors which
[185] make it easy to understand the fateful increase of nervous illness; for those injurious factors take effect first and foremost on the brain. In the course of the last decades changes have taken place in the political and social – and especially in the mercantile, industrial and agricultural – conditions of civilized nations which have brought about great changes in people's occupations, social position and property, and this at the cost of the nervous system, which is called upon to meet the increased social and economic demands by a greater expenditure of energy, often with quite inadequate opportunity for recuperation.'

The fault I have to find with these and many other similarly worded opinions is not that they are mistaken but that they prove insufficient to explain the details in the picture of nervous disturbances and that they leave out of account precisely the most important of the aetiological factors involved. If we disregard the vaguer ways of being 'nervous' and consider the specific forms of nervous illness, we shall find that the injurious influence of civilization reduces itself in the main to the harmful suppression of the sexual life of civilized peoples (or classes) through the 'civilized' sexual morality prevalent in them.

I have tried to bring forward the evidence for this assertion in a number of technical papers.[1] I cannot repeat it here. I will, however, quote the most important of the arguments arising from my investigations.

Careful clinical observation allows us to distinguish two groups of nervous disorders: the *neuroses* proper and the *psychoneuroses*. In the former the disturbances (the symptoms), whether they show their effects in somatic or mental functioning, appear to be of a *toxic* nature. They behave exactly like the phenomena accompanying an excess or a deprivation of certain nerve poisons. These neuroses – which are commonly grouped together as 'neurasthenia' – can be induced by certain injurious

1 See my collection of short papers on the theory of the neuroses (1906*b*) [*RSE*, **3**, 5].

influences in sexual life, without any hereditary taint being necessarily present; indeed, the form taken by the disease corresponds to the nature [186]
of these noxae, so that often enough the particular sexual aetiology can at once be deduced from the clinical picture. There is a total absence, on the other hand, of any such regular correspondence between the form of a nervous illness and the other injurious influences of civilization which are blamed by the authorities. We may, therefore, regard the sexual factor as the essential one in the causation of the neuroses proper.

With the psychoneuroses, the influence of heredity is more marked and the causation less transparent. A peculiar method of investigation known as psychoanalysis has, however, enabled us to recognize that the symptoms of these disorders (hysteria, obsessional neurosis, etc.) are *psychogenic* and depend upon the operation of unconscious (repressed [*verdrängter*]T) ideational complexes [*Vorstellungskomplexe*]T. This same *Verdrängung, Vorstellung*
method has also taught us what those unconscious complexes are and has shown that, quite generally speaking, they have a sexual content. They spring from the sexual needs of people who are unsatisfied and represent for them a kind of substitutive satisfaction. We must therefore view all factors which impair sexual life, suppress its activity or distort its aims as being pathogenic factors in the psychoneuroses as well.

The value of a theoretical distinction between toxic and psychogenic neuroses is, of course, not diminished by the fact that, in most people suffering from nervous illness, disturbances arising from both sources are to be observed.

The reader who is prepared to agree with me in looking for the aetiology of nervous illness pre-eminently in influences which damage sexual life will also be ready to follow the further discussion, which is intended to set the theme of increasing nervous illness in a wider context.

Generally speaking, our civilization [*Kultur*] is built up on the suppression of drives [*Trieben*]T. Each individual has surrendered some part of his assets – some part of the sense of omnipotence or of the aggressive or vindictive inclinations in his personality. From these contributions has grown civilization's common assets in material and ideal wealth. Besides [187]
the exigencies of life, no doubt it has been family feelings, derived from erotism, that have induced the separate individuals to make this renunciation. The renunciation has been a progressive one in the course of the evolution of civilization. The single steps in it were sanctioned by religion; the piece of drive satisfaction which each person had renounced was offered to the Deity as a sacrifice, and the communal property thus acquired was declared 'holy'. The man who, in consequence of his

unyielding constitution, cannot fall in with this suppression of drive becomes a 'criminal', an 'outlaw',[1] in the face of society – unless his social position or his exceptional capacities enable him to impose himself upon it as a great man, a 'hero'.

The sexual drive – or, more correctly, the sexual drives, for analytic investigation teaches us that the sexual drive is made up of many separate constituents or component drives – is probably more strongly developed in man than in most of the higher animals; it is certainly more constant, since it has almost entirely overcome the periodicity to which it is tied in animals. It places extraordinarily large amounts of force
Kraft [*Kraftmengen*][T] at the disposal of civilized activity, and it does this by virtue of its especially marked characteristic of being able to displace its aim without materially diminishing in intensity. This capacity to exchange its originally sexual aim for another one, which is no longer sexual but which is psychically related to the first aim, is called the capac-
Verschiebung ity for *sublimation*. In contrast to this displaceability [*Verschiebbarkeit*][T], in which its value for civilization lies, the sexual drive may also exhibit a particularly obstinate fixation which renders it unserviceable and which sometimes causes it to degenerate into what are described as abnormalities. The original strength of the sexual drive probably varies in each individual; certainly the proportion of it which is suitable for sublima-
[188] tion varies. It seems to us that it is the innate constitution of each individual which decides in the first instance how large a part of his sexual drive it will be possible to sublimate and make use of. In addition to this, the effects of experience and the intellectual influences upon his mental apparatus succeed in bringing about the sublimation of a further portion of it. To extend this process of displacement indefinitely is, however, certainly not possible, any more than is the case with the transformation of heat into mechanical energy in our machines. A certain amount of direct sexual satisfaction seems to be indispensable for most organizations, and a deficiency [*Versagung*][2] in this amount, which varies from individual to individual, is visited by phenomena which, on account of their detrimental effects on functioning and their subjective
Unlust quality of unpleasure [*Unlustcharakters*][T], must be regarded as an illness.

Further prospects are opened up when we take into consideration the

1 [In English in the original. – The gist of this paragraph, including the definition of 'holy' ('*heilig*'), can be found in a note to Fliess of May 31, 1897 (Freud, 1950*a*, Draft N). The word is again discussed in Essay III, Part II (D) of *Moses and Monotheism* (1939*a*), *RSE*, **23**, 109 and *n*. 1.]

2 [Freud later used this term, in a wider sense, to describe the principal factor in bringing about the onset of neurosis. In this sense it is rendered by the English 'frustration'. See the Editors' Note to the paper on 'Types of Onset of Neurosis' (1912*c*), ibid., **12**, 225. See also ibid., **24**, 93.]

fact that in man the sexual drive does not originally serve the purposes of reproduction at all, but has as its aim the gaining of particular kinds of pleasure [*Lustgewinnung*].[1] It manifests itself in this way in human infancy, during which it attains its aim of gaining pleasure not only from the genitals but from other parts of the body (the erotogenic zones), and can therefore disregard any objects other than these convenient ones. We call this stage the stage of *auto-erotism*, and the child's upbringing [*Erziehung*][T] has, in our view, the task of restricting it, because to linger in it would make the sexual drive uncontrollable and unserviceable later on. The development of the sexual drive then proceeds from auto-erotism to object love and from the autonomy of the erotogenic zones to their subordination under the primacy of the genitals, which are put at the service of reproduction. During this development a part of the sexual excitation [*Sexualerregung*][T] which is provided by the subject's own body is inhibited [*gehemmt*][T] as being unserviceable for the reproductive function and in favourable cases is brought to sublimation. The forces that can be employed for cultural activities are thus to a great extent obtained through the suppression of what are known as the *perverse* elements of sexual excitation.

[189]
Erregung
Hemmung

If this evolution of the sexual drive is borne in mind, three stages of civilization can be distinguished: a first one, in which the sexual drive may be freely exercised without regard to the aims of reproduction; a second, in which all of the sexual drive is suppressed except what serves the aims of reproduction; and a third, in which only *legitimate* reproduction is allowed as a sexual aim. This third stage is reflected in our present-day 'civilized' sexual morality.

If we take the second of these stages as an average, we must point out that a number of people are, on account of their organization, not equal to meeting its demands. In whole classes of individuals the development of the sexual drive, as we have described it above, from auto-erotism to object love with its aim of uniting the genitals, has not been carried out correctly and sufficiently fully. As a result of these disturbances of development two kinds of harmful deviation from normal sexuality – that is, sexuality which is serviceable to civilization – come about; and the relation between these two is almost that of positive and negative.[2]

In the first place (disregarding people whose sexual drive is altogether excessive and uninhibitable) there are the different varieties of *perverts*, in whom an infantile fixation to a preliminary sexual aim has

1 Cf. my *Three Essays on the Theory of Sexuality* (1905*d*) [*RSE*, **7**, 174 f.].

2 [See below, p. 167.]

prevented the primacy of the reproductive function from being established, and the *homosexuals* or *inverts*, in whom, in a manner that is not yet quite understood, the sexual aim has been deflected away from the opposite sex. If the injurious effects of these two kinds of developmental disturbance are less than might be expected, this mitigation can be
[190] ascribed precisely to the complex way in which the sexual drive is put together, which makes it possible for a person's sexual life to reach a serviceable final form even if one or more components of the drive have been shut off from development. The constitution of people suffering from inversion – the homosexuals – is, indeed, often distinguished by their sexual drive's possessing a special aptitude for cultural sublimation.

More pronounced forms of the perversions and of homosexuality, especially if they are exclusive, do, it is true, make those subject to them socially useless and unhappy, so that it must be recognized that the cultural requirements even of the second stage are a source of suffering for a certain proportion of mankind. The fate of these people who differ constitutionally from the rest varies, and depends on whether they have been born with a sexual drive which by absolute standards is strong or comparatively weak. In the latter case – where the sexual drive is in general weak – perverts succeed in totally suppressing the inclinations which bring them into conflict with the moral demands of their stage of civilization. But this, from the ideal point of view, is also the only thing they succeed in achieving; for, in order to effect this suppression of their sexual drive, they use up the forces which they would otherwise employ in cultural activities. They are, as it were, inwardly inhibited and outwardly paralysed. What we shall be saying again later on about the abstinence demanded of men and women in the third stage of civilization applies to them too.

Where the sexual drive is fairly intense, but perverse, there are two possible outcomes. The first, which we shall not discuss further, is that the person affected remains a pervert and has to put up with the consequences of his deviation from the standard of civilization. The second is far more interesting. It is that, under the influence of education and social demands, a suppression of the perverse drives is indeed achieved, but it is a kind of suppression which is really no suppression at all. It can better be described as a suppression that has failed. The inhibited sexual
[191] drives are, it is true, no longer expressed as such – and this constitutes the success of the process – but they find expression in other ways, which are quite as injurious to the subject and make him quite as useless

for society as satisfaction of the suppressed drives in an unmodified form would have done. This constitutes the failure of the process, which in the long run more than counterbalances its success. The substitutive phenomena which emerge in consequence of the suppression of the drive amount to what we call nervous illness, or, more precisely, the psychoneuroses.[1] Neurotics are the class of people who, since they possess a recalcitrant organization, only succeed, under the influence of cultural requirements, in achieving a suppression of their drives which is *apparent* and which becomes increasingly unsuccessful. They therefore carry on their collaboration with cultural activities only by a great expenditure of force and at the cost of an internal impoverishment, or are obliged at times to interrupt it and fall ill. I have described the neuroses as the 'negative' of the perversions [p. 165 above] because in the neuroses the perverse impulses, after being repressed, manifest themselves from the unconscious part of the mind – because the neuroses contain the same tendencies, though in a state of 'repression', as do the positive perversions.[2]

Experience teaches us that for most people there is a limit beyond which their constitution cannot comply with the demands of civilization. All who wish to be more noble-minded than their constitution allows fall victim to neurosis; they would have been more healthy if it could have been possible for them to be less good. The discovery that perversions and neuroses stand in the relation of positive and negative is often unmistakably confirmed by observations made on the members of one generation of a family. Quite frequently a brother is a sexual pervert, while his sister, who, being a woman, possesses a weaker sexual drive, is [192]
a neurotic whose symptoms express the same inclinations as the perversions of her sexually more active brother. And correspondingly, in many families the men are healthy, but from a social point of view immoral to an undesirable degree, while the women are high-minded and over-refined, but severely neurotic.

It is one of the obvious social injustices that the standard of civilization should demand from everyone the same conduct of sexual life – conduct which can be followed without any difficulty by some people, thanks to their organization, but which imposes the heaviest psychical sacrifices on others; though, indeed, the injustice is as a rule wiped out by disobedience to the injunctions of morality.

1 Cf. my introductory remarks above [p. 163].

2 [Freud's first published statement to this effect occurs in the *Three Essays* (1905*d*), *RSE*, 7, 147. As can be seen, however, from a footnote to that passage, the notion had been expressed by him many years earlier in his letters to Fliess.]

These considerations have been based so far on the requirement laid down by the second of the stages of civilization which we have postulated [p. 165 above], the requirement that every sexual activity of the kind described as perverse is prohibited, while what is called normal sexual intercourse is freely permitted. We have found that even when the line between sexual freedom and restriction is drawn at this point, a number of individuals are ruled out as perverts, and a number of others, who make efforts not to be perverts while constitutionally they should be so, are forced into nervous illness. It is easy to predict the result that will follow if sexual freedom is still further circumscribed and the requirements of civilization are raised to the level of the third stage, which bans all sexual activity outside legal marriage. The number of strong natures who openly oppose the demands of civilization will increase enormously, and so will the number of weaker ones who, faced with the conflict between the pressure of cultural influences and the resistance of their constitution, take flight into neurotic illness.[1]

Let us now try to answer three questions that arise here:

(1) What is the task that is set to the individual by the requirements of the third stage of civilization?

[193] (2) Can the legitimate sexual satisfaction that is permissible offer acceptable compensation for the renunciation of all other satisfactions?

(3) In what relation do the possible injurious effects of this renunciation stand to its exploitation in the cultural field?

The answer to the first question touches on a problem which has often been discussed and cannot be exhaustively treated here – that of sexual abstinence. Our third stage of civilization demands of individuals of both sexes that they shall practise abstinence until they are married and that all who do not contract a legal marriage shall remain abstinent throughout their lives. The position, agreeable to all the authorities, that sexual abstinence is not harmful and not difficult to maintain, has also been widely supported by the medical profession. It may be asserted, however, that the task of mastering such a powerful impulse as that of the sexual drive by any other means than satisfying it is one which can call for the whole of a man's forces [*Kräfte*]. Mastering it by sublimation, by deflecting the sexual drive forces away from their sexual aim to higher cultural aims, can be achieved by a minority and then only intermittently, and least easily during the period of ardent and vigorous youth. Most of the rest become neurotic or are harmed in one way or another. Experience shows that the majority of the people who make up our

1 [See footnote 2, p. 203 below.]

society are constitutionally unfit to face the task of abstinence. Those who would have fallen ill under milder sexual restrictions fall ill all the more readily and more severely before the demands of our cultural sexual morality of today; for we know no better safeguard against the threat to normal sexual life offered by defective innate dispositions or disturbances of development than sexual satisfaction itself. The more a person is disposed to neurosis, the less can he tolerate abstinence; drives which have been withdrawn from normal development, in the sense in which it has been described above, become at the same time all the more uninhibitable. But even those people who would have retained their health [194]
under the requirements of the second stage of civilization will now succumb to neurosis in great numbers. For the psychical value of sexual satisfaction increases with its frustration [*Versagung*][T]. The dammed-up libido is now put in a position to detect one or other of the weaker spots which are seldom absent in the structure [*Aufbau*][T] of sexual life, and there to break through and obtain substitutive satisfaction of a neurotic kind in the form of pathological symptoms. Anyone who is able to penetrate the determinants of nervous illness will soon become convinced that its increase in our society arises from the intensification of sexual restrictions.

This brings us to the question whether sexual intercourse in legal marriage can offer full compensation for the restrictions imposed before marriage. There is such an abundance of material supporting a reply in the negative that we can give only the briefest summary of it. It must above all be borne in mind that our cultural sexual morality restricts sexual intercourse even in marriage itself, since it imposes on married couples the necessity of contenting themselves, as a rule, with a very few procreative acts. As a consequence of this consideration, satisfying sexual intercourse in marriage takes place for only a few years; and we must subtract from this, of course, the intervals of abstention necessitated by regard for the wife's health. After these three, four or five years, the marriage becomes a failure insofar as it has promised the satisfaction of sexual needs. For all the devices hitherto invented for preventing conception impair sexual enjoyment, hurt the fine susceptibilities of both partners and even actually cause illness [p. 157 *n.* above]. Fear of the consequences of sexual intercourse first brings the married couple's physical affection to an end; and then, as a remoter result, it usually puts a stop as well to the mental sympathy between them, which should have been the successor to their original passionate love. The spiritual disillusionment and bodily deprivation to which most marriages are thus

doomed puts both partners back in the state they were in before their
[195] marriage, except for being the poorer by the loss of an illusion, and they must once more have recourse to their fortitude in mastering and deflecting their sexual drive. We need not enquire how far men, by then in their maturer years, succeed in this task. Experience shows that they very frequently avail themselves of the degree of sexual freedom which is allowed them – although only with reluctance and under a veil of silence – by even the strictest sexual code. The 'double' sexual morality which is valid for men in our society is the plainest admission that society itself does not believe in the possibility of enforcing the precepts which it itself has laid down. But experience shows as well that women, who, as being the actual vehicle of the sexual interests of mankind, are only endowed in a small measure with the gift of sublimating their drives, and who, though they may find a sufficient substitute for the sexual object in an infant at the breast, do not find one in a growing child – experience shows, I repeat, that women, when they are subjected to the disillusionments of marriage, fall ill of severe neuroses which permanently darken their lives. Under the cultural conditions of today, marriage has long ceased to be a panacea for the nervous troubles of women; and if we doctors still advise marriage in such cases, we are nevertheless aware that, on the contrary, a girl must be very healthy if she is to be able to tolerate it, and we urgently advise our male patients not to marry any girl who has had nervous trouble before marriage. On the contrary, the cure for nervous illness arising from marriage would be marital unfaithfulness. But the more strictly a woman has been brought up and the more sternly she has submitted to the demands of civilization, the more she is afraid of taking this way out; and in the conflict between her desires and her sense of duty, she once more seeks refuge in a neurosis. Nothing protects her virtue as securely as an illness. Thus the married state, which is held out as a consolation to the sexual drive of the civilized person in his youth, proves to be inadequate even to the demands of the actual
[196] period of life covered by it. There is no question of its being able to compensate for the deprivation which precedes it.

But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question [p. 168 above] that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, affect only a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to

the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated.

The retardation of sexual development and sexual activity at which our education and civilization aim is certainly not injurious to begin with. It is seen to be a necessity, when one considers the late age at which young people of the educated classes reach independence and are able to earn a living. (This reminds one, incidentally, of the intimate interconnection between all our cultural institutions and of the difficulty of altering any part of them without regard to the whole.)[1] But abstinence continued long after the age of twenty is no longer unobjectionable for a young man; and it leads to other damage even when it does not lead to neurosis. People say, to be sure, that the struggle against such a powerful drive, and the strengthening of all the ethical and aesthetic forces which are necessary for this struggle, 'steel' the character; and this is true for a few specially favourably organized natures. It must also be admitted that the differentiation of individual character, which is so marked in our day, has only become possible with the existence of sexual restriction. But in the vast majority of cases the struggle against sexuality eats up the energy available in a character and this at the very time when a young man is in need of all his forces in order to win his share and place in society. The [197] relationship between the amount of sublimation possible and the amount of sexual activity necessary naturally varies very much from person to person and even from one calling to another. An abstinent artist is hardly conceivable; but an abstinent young savant is certainly no rarity. The latter can, by his self-restraint, liberate forces for his studies; while the former probably finds his artistic achievements powerfully stimulated by his sexual experience. In general I have not gained the impression that sexual abstinence helps to bring about energetic and self-reliant men of action or original thinkers or bold emancipators and reformers. Far more often it goes to produce well-behaved weaklings who later become lost in the great mass of people that tends to follow, unwillingly, the leads given by strong individuals.

The fact that the sexual drive behaves in general in a self-willed and inflexible fashion is also seen in the results produced by efforts at abstinence. Civilized education may only attempt to suppress the drive temporarily, till marriage, intending to give it free rein afterwards with the idea of then making use of it. But extreme measures are more successful against it than attempts at moderating it; thus the suppression

1 [Cf. above, p. 117.]

often goes too far, with the unwished-for result that when the drive is set free it turns out to be permanently impaired. For this reason complete abstinence in youth is often not the best preparation for marriage for a young man. Women sense this, and prefer among their suitors those who have already proved their masculinity with other women. The harmful results which the strict demand for abstinence before marriage produces in women's natures are quite especially apparent. It is clear that education is far from underestimating the task of suppressing a girl's sensuality till her marriage, for it makes use of the most drastic measures. Not only does it forbid sexual intercourse and set a high premium on the preservation of female chastity, but it also protects the young woman
[198] from temptation as she grows up, by keeping her ignorant of all the facts of the part she is to play and by not tolerating any impulse of love in her which cannot lead to marriage. The result is that when the girl's parental authorities suddenly allow her to fall in love, she is unequal to this psychical achievement and enters marriage uncertain of her own feelings. In consequence of this artificial retardation in her function of love, she has nothing but disappointments to offer the man who has saved up all his desire for her. In her mental feelings she is still attached to her parents, whose authority has brought about the suppression of her sexuality; and in her physical behaviour she shows herself frigid, which deprives the man of any high degree of sexual enjoyment. I do not know whether the anaesthetic type of woman exists apart from civilized education, though I consider it probable. But in any case such education actually breeds it, and these women who conceive without pleasure show little willingness afterwards to face the pains of frequent childbirth. In this way, the preparation for marriage frustrates the aims of marriage itself. When later on the retardation in the wife's development has been overcome and her capacity to love is awakened at the climax of her life as a woman, her relations to her husband have long since been ruined; and, as a reward for her previous docility, she is left with the choice between unappeased desire, unfaithfulness or a neurosis.

The sexual behaviour of a human being often *lays down the pattern* for all his other modes of reacting to life. If a man is energetic in winning the object of his love, we are confident that he will pursue his other aims with an equally unswerving energy; but if, for all sorts of reasons, he refrains from satisfying his strong sexual drives, his behaviour will be conciliatory and resigned rather than vigorous in other spheres of life as well. A special application of this proposition that sexual life lays down the pattern for the exercise of other functions can easily be recognized in

the female sex as a whole. Their upbringing forbids their concerning themselves intellectually with sexual problems, though they nevertheless [199] feel extremely curious about them, and frightens them by condemning such curiosity as unwomanly and a sign of a sinful disposition. In this way they are scared away from *any* form of thinking, and knowledge loses its value for them. The prohibition of thought extends beyond the sexual field, partly through unavoidable association, partly automatically, like the prohibition of thought about religion among men, or the prohibition of thought about loyalty among faithful subjects. I do not believe that women's 'physiological feeble-mindedness' is to be explained by a biological opposition between intellectual work and sexual activity, as Moebius has asserted in a work[1] which has been widely disputed. I think that the undoubted intellectual inferiority of so many women can rather be traced back to the inhibition of thought necessitated by sexual suppression.

In considering the question of abstinence, the distinction is not nearly strictly enough made between two forms of it – namely abstention from any sexual activity whatever and abstention from sexual intercourse with the opposite sex. Many people who boast of succeeding in being abstinent have only been able to do so with the help of masturbation and similar satisfactions which are linked with the auto-erotic sexual activities of early childhood. But precisely because of this connection such substitutive means of sexual satisfaction are by no means harmless; they predispose to the numerous varieties of neuroses and psychoses which are conditional on an involution of sexual life to its infantile forms. Masturbation, moreover, is far from meeting the ideal demands of civilized sexual morality, and consequently drives young people into the same conflicts with the ideals of education which they hoped to escape by abstinence. Furthermore, it vitiates the character through *indulgence*, and this in more than one way. In the first place, it teaches people to achieve important aims without taking trouble and by easy paths instead of through an energetic exertion of force – that is, it follows the principle [200] that *sexuality lays down the pattern* of behaviour [see above, p. 172]; secondly, in the phantasies that accompany satisfaction the sexual object is raised to a degree of excellence which is not easily found again in reality. A witty writer (Karl Kraus in the Vienna paper *Die Fackel*[2]) once

1 [Cf. Moebius, 1903. See also Chapter IX of *The Future of an Illusion* (1927*c*), *RSE*, **21**, 44–5.]

2 [Karl Kraus (1874–1936), the Austrian journalist and poet, was celebrated for his pugnacious and scathing wit. An anecdote about him is quoted by Freud in his book on *Jokes* (1905*c*), Chapter II, Section 11; ibid., **8**, 68, and is repeated in a footnote to the 'Rat Man' case history (1909*d*), ibid., **10**, 172 *n*. 2.]

expressed this truth in reverse by cynically remarking: 'Copulation is no more than an unsatisfying substitute for masturbation.'[1]

The sternness of the demands of civilization and the difficulty of the task of abstinence have combined to make avoidance of the union of the genitals of the two opposite sexes into the central point of abstinence and to favour other kinds of sexual activity, which, it might be said, are equivalent to semi-obedience. Since normal intercourse has been so relentlessly persecuted by morality – and also, on account of the possibilities of infection, by hygiene – what are known as the perverse forms of intercourse between the two sexes, in which other parts of the body take over the role of the genitals, have undoubtedly increased in social importance. These activities cannot, however, be regarded as being as harmless as analogous extensions [of the sexual aim][2] in love relationships. They are ethically objectionable, for they degrade the relationships of love between two human beings from a serious matter to a convenient
Seele game, attended by no risk and no spiritual [*seelische*][T] participation. A further consequence of the aggravation of the difficulties of normal sexual life is to be found in the spread of homosexual satisfaction; in addition to all those who are homosexuals by virtue of their organization, or who became so in their childhood, there must be reckoned the
[201] great number of those in whom, in their maturer years, a blocking of the main stream of their libido has caused a widening in the side-channel of homosexuality.

All these unavoidable and unintended consequences of the requirement for abstinence converge in the one common result of completely ruining the preparation for marriage – marriage, which civilized sexual morality thinks should be the sole heir to the sexual impulsions. Every man whose libido, as a result of masturbatory or perverse sexual practices, has become habituated to situations and conditions of satisfaction which are not normal develops diminished potency in marriage. Women, too, who have been able to preserve their virginity with the help of similar measures, show themselves anaesthetic to normal intercourse in marriage. A marriage begun with a reduced capacity to love on both sides succumbs to the process of dissolution even more quickly than others. As a result of the man's weak potency, the woman is not satisfied, and she remains anaesthetic even in cases where her disposition to frigidity, derived from her education, could have been overcome by a powerful

1 [In a much fuller discussion of masturbation some years later (1912*f*), Freud returned to the points mentioned in this paragraph. See *RSE*, **12**, 246–8.]

2 [See Freud's *Three Essays* (1905*d*), ibid., **7**, 134 ff.]

sexual experience. A couple like this finds more difficulties, too, in the prevention of children than a healthy one, since the husband's diminished potency tolerates the use of contraceptives badly. In this perplexity, sexual intercourse, as being the source of all their embarrassments, is soon given up, and with this the basis of married life is abandoned.

I ask any well-informed person to bear witness to the fact that I am not exaggerating but that I am describing a state of affairs of which equally bad instances can be observed over and over again. To the uninitiated it is hardly credible how seldom normal potency is to be found in a husband and how often a wife is frigid among married couples who live under the dominance of our civilized sexual morality, what a degree of renunciation, often on both sides, is entailed by marriage, and to what narrow limits married life – the happiness that is so ardently desired – is narrowed down. I have already explained that in these circumstances the most obvious outcome is nervous illness; but I must [202]
further point out the way in which a marriage of this kind continues to exercise its influence on the few children, or the only child born of it. At first glance, it seems to be a case of transmission [*Übertragung*][T] by inheritance; but closer inspection shows that it is really a question of the effect of powerful infantile impressions. A neurotic wife who is unsatisfied by her husband is, as a mother, over-tender and overanxious towards her child, on to whom she transfers [*überträgt*] her need for love; and she awakens it to sexual precocity. The bad relations between its parents, moreover, excite its emotional life and cause it to feel love and hatred to an intense degree while it is still at a very tender age. Its strict upbringing, which tolerates no activity of the sexual life that has been aroused so early, lends support to the suppressing force [*Macht*] and this conflict at such an age contains everything necessary for bringing about lifelong nervous illness.

I return now to my earlier assertion [p. 171 above] that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a shortlived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or

a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever
[203] their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces [*Seelenkräfte*] that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse [*Regungen*] which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become overkind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

Let us add that a restriction of sexual activity in a community is quite generally accompanied by an increase of anxiety about life [*Lebensängstlichkeit*][T] and of fear of death which interferes with the individual's capacity for enjoyment and does away with his readiness to face death for any purpose. A diminished inclination to beget children is the result, and the community or group of people in question is thus excluded from
[204] any share in the future. In view of this, we may well raise the question whether our 'civilized' sexual morality is worth the sacrifice which it imposes on us, especially if we are still so much enslaved to hedonism as

Angst

to include among the aims of our cultural development a certain amount of satisfaction of individual happiness. It is certainly not a physician's business to come forward with proposals for reform; but it seemed to me that I might support the urgency of such proposals if I were to amplify Von Ehrenfels's description of the injurious effects of our 'civilized' sexual morality[1] by pointing to the important bearing of that morality upon the spread of modern nervous illness.

1 [Christian von Ehrenfels (1859–1932), Professor of Philosophy at Prague, had been praised by Freud for his courageous criticisms of the institution of marriage, in Section 3 of Chapter III of the book on *Jokes* (1905*c*), *RSE*, **8**, 97–8.]

ON THE SEXUAL THEORIES OF CHILDREN

The present translation is a revised and corrected reprint of the *SE* version.

This paper was first published in a later issue of the same periodical as the preceding paper (p. 157 above). Though it made its appearance so unostentatiously, and though there may be little in it to surprise the modern reader, it, in fact, launched a quite remarkable quantity of new ideas for the first time on the world. The paradox becomes explicable when we realize that this paper was published some months before the 'Little Hans' case history (1909*b*) (though, as can be seen from footnote 2, p. 190 below, that work was probably already in proof) and that the section of the *Three Essays* (1905*d*) on 'The Sexual Researches of Childhood' (*RSE*, **7**, 172–4) was only added to that work in 1915, eight years after the publication of this paper, of which, in fact, that section is little more than an abstract. It is true that in an earlier paper on 'The Sexual Enlightenment of Children' (1907*c*) Freud quoted some of the material derived from 'Little Hans' (p. 113 f. above) and discussed very briefly the [208] sexual curiosity of children. He even mentioned the existence of 'infantile sexual theories' (p. 115 f.); but it was a bare mention without the least specification of their nature.[1]

1 Freud had alluded to the topic of the sexual theories of children at the same meeting of the Vienna Psychoanalytical Society (February 13, 1907) at which he read the letter quoted on p. 115 above. (See the additional note to that page.)

Here, then, the first readers of the present work were confronted, almost without previous warning, with the notions of fertilization through the mouth and of birth through the anus, of parental intercourse as something sadistic, and of the possession of a penis by members of both sexes. This last notion was the one with the most far-reaching implications, and they in turn find a first mention in these pages: the importance attached to the penis by children of both sexes, the results of the discovery that one sex is without it – the emergence in girls of 'envy for the penis' and in boys of the concept of 'the woman with a penis' and its bearing on one form of homosexuality. Finally, we have here the first explicit mention and discussion of the 'castration complex' itself, which had been foreshadowed by only a single obscure reference to a threat of castration in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 553.

The peculiar wealth of material contained here is no doubt to be attributed largely to the findings in the 'Little Hans' analysis, the report upon which, recently completed, illustrated and expanded much of the content of the present paper.

ON THE SEXUAL THEORIES OF CHILDREN

The material on which the following synthesis is based is derived from several sources. Firstly, from the direct observation of what children say and do; secondly, from what adult neurotics consciously remember from their childhood and relate during psychoanalytic treatment; and thirdly, from the inferences and constructions [*Konstruktionen*], and from the unconscious memories translated into conscious material, which result from the psychoanalysis of neurotics. [209]

That the first of these three sources has not by itself supplied all that is worth knowing on the subject is due to the attitude which the adult adopts towards the sexual life of children. He does not credit them with having any sexual activity and therefore takes no trouble to observe any such thing while, on the other hand, he suppresses any manifestation of such an activity which might claim his attention. Consequently the opportunity of obtaining information from this, the most unequivocal and fertile source of all, is a very restricted one. Whatever comes from the uninfluenced communications made by adults concerning their own conscious childhood memories is at the best subject to the objection that it may have been falsified in retrospect [*Rückschau*]; but, in addition to this, it has to be viewed in the light of the fact that the informants have subsequently become neurotic. The material that comes from the third source is open to all the criticisms which it is the custom to marshal against the trustworthiness of psychoanalysis and the reliability of the conclusions that are drawn from it. Thus I cannot attempt to justify it here; I can only give an assurance that those who know and practise the psychoanalytic technique acquire an extensive confidence in its findings.

I cannot guarantee the completeness of my results, but I can answer for the care taken in arriving at them. [210]

There remains a difficult question to decide. How far may one assume that what is here reported of children generally is true of all children – that is, of every particular child? Pressure of education [*Erziehungsdruck*][T] and varying intensity of the sexual drive *Erziehung*

Trieb [*Sexualtriebes*][T] certainly make great individual variations in the sexual behaviour of children possible, and, above all, influence the date at which a child's sexual interest appears. For this reason, I have not divided my presentation of the material according to the successive epochs of childhood, but have combined into a single account things that come into play in different children sometimes earlier and sometimes later. It is my conviction that no child – none, at least, who is mentally normal and still less one who is intellectually gifted – can avoid being occupied with the problems of sex in the years *before* puberty.

I do not think much of the objection that neurotics are a special class of people, marked by an innate disposition that is 'degenerate', from whose childhood life we must not be allowed to infer anything about the childhood of other people. Neurotics are people much like others. They cannot be sharply differentiated from normal people, and in their childhood they are not always easily distinguishable from those who remain healthy in later life. It is one of the most valuable results of our psychoanalytic investigations to have discovered that the neuroses of such people have no special mental content that is peculiar to them, but that, as Jung has expressed it, they fall ill of the same complexes against which we healthy people struggle as well. The only difference is that healthy people know how to overcome those complexes without any gross damage demonstrable in practical life, whereas in nervous cases the suppression of the complexes succeeds only at the price of costly substitutive formations – that is to say, from a practical point of view it is a failure. In childhood neurotic and normal people naturally
[211] approximate to each other much more closely than they do in later life, so that I cannot regard it as a methodological error to make use of the communications of neurotics about their childhood for drawing conclusions by analogy about normal childhood life. But since those who later become neurotics very often have in their inborn constitution
Geschlecht an especially strong sexual drive [*Geschlechtstrieb*][T] and a tendency to precocity and to a premature expression of that drive, they make it possible for us to recognize a great deal of infantile activity more sharply and clearly than our capacity for observation (which is in any case a blunted one) would enable us to do in other children. But we shall of course only be able to assess the true value of these communications made by neurotic adults when, following Havelock Ellis's example, we shall have thought it worthwhile to collect the childhood memories of *healthy* adults as well.[1]

1 [Cf. Havelock Ellis, 1903, Appendix B. Freud had discussed these narratives in a footnote to the second of his *Three Essays* (1905*d*), *RSE*, **7**, 169 *n.*]

In consequence of unfavourable circumstances, both of an external and an internal nature, the following observations apply chiefly to the sexual development of one sex only – that is, of males. The value of a compilation such as I am attempting here need not, however, be a purely descriptive one. A knowledge of infantile sexual theories in the shapes they assume in the thoughts of children can be of interest in various ways – even, surprisingly enough, for the elucidation of myths and fairy tales. They are indispensable, moreover, for an understanding of the neuroses themselves; for in them these childish theories are still operative and acquire a determining influence upon the form taken by the symptoms.

If we could divest ourselves of our corporeal existence, and could view the things of this earth with a fresh eye as purely thinking beings, from another planet for instance, nothing perhaps would strike our attention more forcibly than the fact of the existence of two sexes among human beings, who, though so much alike in other respects, yet mark the difference between them with such obvious external signs. But it does not seem that children choose this fundamental fact in the same way as the starting point of their researches into sexual problems. Since they have known a father and mother as far back as they can remember in life, they accept their existence as a reality which needs no further enquiry, and a boy has the same attitude towards a little sister from whom he is separated by only a slight difference of age of one or two years. A child's desire for knowledge on this point does not in fact awaken spontaneously, prompted perhaps by some inborn need for established causes; it is aroused under the goad of the self-seeking drives that dominate him, when – perhaps after the end of his second year – he is confronted with the arrival of a new baby. And a child whose own nursery has received no such addition is able, from observations made in other homes, to put himself in the same situation. The loss of his parents' care, which he actually experiences or justly fears, and the presentiment that from now on he must for evermore share all his possessions with the newcomer, have the effect of awakening his emotions and sharpening his capacities for thought. The elder child expresses unconcealed hostility towards his rival, which finds vent in unfriendly criticisms of it, in wishes that 'the stork should take it away again'[1] and occasionally even in small attacks

[212]

1 [This anecdote appeared in the first edition of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 223.]

upon the creature lying helpless in the cradle. A wider difference in age usually softens the expression of this primary hostility. In the same way, at a rather later age, if no small brother or sister has appeared, the child's wish for a playmate, such as he has seen in other families, may gain the upper hand.

At the instigation of these feelings and worries, the child now comes to be occupied with the first, grand problem of life and asks himself the
[213] question: '*Where do babies come from?*'[1] – a question which, there can be no doubt, first ran: 'Where did this particular, intruding baby come from?' We seem to hear the echoes of this first riddle in innumerable riddles of myth and legend. The question itself is, like all research, the product of a vital exigency,[2] as though thinking were entrusted with the task of preventing the recurrence of such dreaded events. Let us assume, however, that the child's thinking soon becomes independent of this instigation, and henceforward goes on operating as a self-sustained drive to research. Where a child is not already too much intimidated, he sooner or later adopts the direct method of demanding an answer from his parents or those in charge of him, who are in his eyes the source of all knowledge. This method, however, fails. The child receives either evasive answers or a rebuke for his curiosity, or he is dismissed with the mythologically significant piece of information which, in German countries, runs: 'The stork brings the babies; it fetches them out of the water.' I have reason to believe that far more children than their parents suspect are dissatisfied with this solution and meet it with energetic doubts, which, however, they do not always openly admit. I know of a three-year-old boy who, after receiving this piece of enlightenment, disappeared – to the terror of his nurse. He was found at the edge of the big pond adjoining the country house, to which he had hurried in order to see the babies in the water. I also know of another boy who could only allow his disbelief to find expression in a hesitant remark that he knew better, that it was not a stork that brought babies but a heron. It seems to me to follow from a great deal of information I have received that children refuse to believe the stork theory and that from the time of this first deception and rebuff they nourish a distrust of adults and have a suspi-
[214] cion of there being something forbidden which is being withheld from them by the 'grown-ups', and that they consequently hide their further

1 [See footnote 2, p. 114 above.]

2 [The part played in mental development by the 'exigencies of life' was discussed by Freud in Chapter VII (C) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 505 ff., and earlier in his 'Project' of 1895 (Section 1 of Part I), Freud, 1950*a*; ibid., **1**.]

researches under a cloak of secrecy. With this, however, the child also experiences the first occasion for a 'psychical conflict', in that views which he feels driven to prefer [*triebartige Bevorzugung*], but which are not 'right' in the eyes of the grown-ups, come into opposition with other views, which are supported by the authority of the grown-ups without being acceptable to him himself. Such a psychical conflict may soon turn into a 'psychical dissociation' [*'psychische Spaltung'*]. The set of views which are bound up with being 'good', but also with a cessation of reflection, become the dominant and conscious views; while the other set, for which the child's work of research has meanwhile obtained fresh evidence, but which are not supposed to count, become the suppressed and 'unconscious' ones. The nuclear complex[1] of a neurosis is in this way brought into being.

Recently, the analysis of a five-year-old boy,[2] which his father undertook and which he has handed over to me for publication, has given me irrefutable proof of the correctness of a view towards which the psychoanalysis of adults had long been leading me. I now know that the change which takes place in the mother during pregnancy does not escape the child's sharp eyes and that he is very well able before long to establish the true connection between the increase in his mother's stoutness and the appearance of the baby. In the case just mentioned the boy was three and a half years old when his sister was born and four and three-quarters when he showed his better knowledge by the most unmistakable allusions. This precocious discovery, however, is always kept secret, and later, in conformity with the further vicissitudes [*Schicksalen*][T] of the child's sexual researches, it is repressed [*verdrängt*][T] and forgotten. *Verdrängung*

The 'stork fable', therefore, is not one of the sexual theories of children. On the contrary, it is the child's observation of animals, who hide so little of their sexual life and to whom he feels so closely akin, that strengthens his disbelief in it. With his knowledge, independently obtained, that babies grow inside the mother's body, he would be on the right road to solving the problem on which he first tries out his powers of thinking. But his further progress is inhibited [*gehemmt*][T] by a piece of ignorance which cannot be made good [see below, p. 190] and by false theories which the state of his own sexuality imposes on him. [215] *Hemmung*

1 [Soon after this, e.g. in the 'Rat Man' case history (1909*d*), *RSE*, **10**, 158–9 *n.*, Freud was using this term as equivalent to what a little later (1910*h*), ibid., **11**, 158, he called the 'Oedipus complex'. In the present passage, where it first appears, the application is wider.]

2 [The case history of 'Little Hans' (1909*b*), ibid., **10**, which was published shortly after the present paper.]

These false sexual theories, which I shall now discuss, all have one very curious characteristic. Although they go astray in a grotesque fashion, yet each one of them contains a fragment of real truth; and in this they are analogous to the attempts of adults, which are looked at as strokes of genius, at solving the problems of the universe which are too hard for human comprehension. What is correct and hits the mark in such theories is to be explained by their origin from the components of the sexual drive [*Sexualtriebes*] which are already stirring in the childish organism. For it is not owing to any arbitrary mental act or to chance impressions that those notions arise, but to the necessities of the child's psychosexual constitution; and this is why we can speak of sexual theories in children as being typical, and why we find the same mistaken beliefs in every child whose sexual life is accessible to us.

The first of these theories starts out from the neglect of the differences between the sexes on which I laid stress at the beginning of this paper [p. 185 f. above] as being characteristic of children. It consists in *attributing to everyone, including females, the possession of a penis*, such as the boy knows from his own body. It is precisely in what we must regard as the 'normal' sexual constitution that already in childhood the penis is the leading erotogenic zone and the chief auto-erotic sexual object; and the boy's estimate of its value is logically reflected in his inability to
[216] imagine a person like himself who is without this essential constituent. When a small boy sees his little sister's genitals, what he says shows that his prejudice is already strong enough to falsify his perception.[1] He does not comment on the absence of a penis, but *invariably* says, as though by way of consolation and to put things right: 'Her ——'s still quite small. But when she gets bigger it'll grow all right.'[2] The idea [*Vorstellung*][T] of a woman with a penis returns in later life, in the dreams of adults: the dreamer, in a state of nocturnal sexual excitation [*Erregung*][T], will throw a woman down, strip her and prepare for intercourse – and then, in place of the female genitals, he beholds a well-developed penis and breaks off the dream and the excitation. The numerous hermaphrodites of classical antiquity faithfully reproduce this idea, universally held in childhood; one may observe that to most normal people they cause no offence, while the real hermaphroditic formations of the genitals which are permitted to occur by Nature nearly always excite the greatest abhorrence.

1 [This 'falsified perception', or, as Freud afterwards named it, this 'denial' or 'disavowal', was very much later to become the basis of important theoretical discussions. Cf., in particular, the paper on 'Fetishism' (1927*e*), *RSE*, **21**, and Chapter VIII of the posthumous *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**.]

2 [Cf. an almost identical remark by 'Little Hans' (1909*b*), ibid., **10**, 9–10.]

If this idea of a woman with a penis becomes 'fixated' in an individual when he is a child, resisting all the influences of later life and making him as a man unable to do without a penis in his sexual object, then, although in other respects he may lead a normal sexual life, he is bound to become a homosexual, and will seek his sexual object among men who, owing to some other physical and mental characteristics, remind him of women.[1] Real women, when he comes to know them later, remain impossible as sexual objects for him, because they lack the essential sexual attraction; indeed, in connection with another impression of his childhood life, they may even become abhorrent to him. The child, having been mainly [217]
dominated by excitations in the penis, will usually have obtained pleasure by stimulating it with his hand; he will have been detected in this by his parents or nurse and terrorized by the threat of having his penis cut off. The effect of this 'threat of castration' is proportionate to the value set upon that organ and is quite extraordinarily deep and persistent. Legends and myths testify to the upheaval in the child's emotional life and to the horror which is linked with the castration complex[2] – a complex which is subsequently remembered by consciousness with corresponding reluctance. The woman's genitalia, when seen later on, are regarded as a mutilated organ and recall this threat, and they therefore arouse horror instead of pleasure in the homosexual. This reaction cannot be altered in any way when the homosexual comes to learn from science that his childish assumption that women had a penis too was not so far wrong after all. Anatomy has recognized the clitoris within the female pudenda as being an organ that is homologous to the penis; and the physiology of the sexual processes has been able to add that this small penis which does not grow any bigger behaves in fact during childhood like a real and genuine penis – that it becomes the seat of excitations which lead to its being touched, that its excitability gives the little girl's sexual activity a masculine character and that a wave of repression in the years of puberty is needed in order for this masculine sexuality to be discarded and the woman to emerge. Since the sexual function of many women is crippled, whether by their obstinate clinging on to this excitability of the clitoris so that they remain anaesthetic in intercourse, or by such excessive repression occurring that its operation is partly replaced by hysterical compensatory formations – all this seems to show that [218]

1 [Freud returned to this in his case history of 'Little Hans' (1909*b*), *RSE*, **10**, 84.]

2 [The first published appearance of the term is the present one, and not in the case study of 'Little Hans', as was wrongly suggested in the *SE* (**10**, 8 *n.*). The idea of a threat of castration occurs in a single sentence in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 553.]

there is some truth in the infantile sexual theory that women, like men, possess a penis.[1]

It is easy to observe that little girls fully share their brother's opinion of it. They develop a great interest in that part of the boy's body. But this interest promptly falls under the sway of envy. They feel themselves unfairly treated. They make attempts to micturate in the posture that is made possible for boys by their possessing a big penis; and when a girl declares that 'she would rather be a boy', we know what deficiency her wish is intended to put right.

If children could follow the hints given by the excitation of the penis they would get a little nearer to the solution to their problem. That the baby grows inside the mother's body is obviously not a sufficient explanation. How does it get inside? What starts its development? That the father has something to do with it seems likely; he says that the baby is *his* baby as well.[2] Again, the penis certainly has a share, too, in these mysterious happenings; the excitation in it which accompanies all these activities of the child's thoughts bears witness to this. Attached to this excitation are impulsions [*Antriebe*] which the child cannot account for – obscure urges to do something violent, to press in, to knock to pieces, to tear open a hole somewhere. But when the child thus seems to be well on the way to postulating the existence of the vagina and to concluding that an incursion of this kind by his father's penis into his mother is the act by means of which the baby is created in his mother's body – at this juncture his enquiry is broken off in helpless perplexity. For standing in its way is his theory that his mother possesses a penis just as a man does, and the existence of the cavity which receives the penis remains undiscovered by him. It is not hard to guess that the lack of success of his
[219] intellectual efforts makes it easier for him to reject and forget them. This brooding and doubting, however, becomes the prototype of all later intellectual work directed towards the solution to problems, and the first failure has a crippling effect on the child's whole future.[3]

Their ignorance of the vagina also makes it possible for children to believe in the second of their sexual theories. If the baby grows in the mother's body and is then removed from it, this can only happen along the one possible pathway – the anal aperture. *The baby must be*

1 [Cf. *Three Essays* (1905*d*), *RSE*, **7**, 194–5. A much earlier hint at some of this occurs in a letter to Fliess of November 14, 1897 (Freud, 1950*a*, Letter 75).]

2 Cf. the 'Analysis of a Five-Year-Old Boy' (1909*b*) [ibid., **10**, 102].

3 [Freud quoted this last sentence in a footnote to his study of Leonardo (1910*c*), ibid., **11**, 74–5 *n.*, where this same subject is discussed. The question had already been approached by Freud (see above, p. 114).]

evacuated like a piece of excrement, like a stool. When, in later childhood, the same question is the subject of solitary reflection or of a discussion between two children, the explanations probably arrived at are that the baby emerges from the navel, which comes open, or that the abdomen is slit up and the baby taken out – which was what happened to the wolf in the story of Little Red Riding-Hood. These theories are expressed aloud and also consciously remembered later on; they no longer contain anything objectionable. These same children have by then completely forgotten that in earlier years they believed in another theory of birth, which is now obstructed by the repression of the anal sexual components that has meanwhile occurred. At that time a motion was something which could be talked about in the nursery without shame. The child was still not so distant from his constitutional coprophilic inclinations. There was nothing degraded about coming into the world like a heap of faeces, which had not yet been condemned by feelings of disgust. The cloacal theory, which, after all, is valid for so many animals, was the most natural theory, and it alone could obtrude upon the child as being a probable one.

This being so, however, it was only logical that the child should refuse to grant women the painful prerogative of giving birth to children. If babies are born through the anus, then a man can give birth just as well [220] as a woman. It is therefore possible for a boy to imagine that he, too, has children of his own, without there being any need to accuse him on that account of having feminine inclinations.[1] He is merely giving evidence in this of the anal erotism which is still alive in him.

If the cloacal theory of birth is preserved in consciousness during later years of childhood, as occasionally happens, it is accompanied too by a solution – no longer, it is true, a primary one – to the problem of the origin of babies. Here it is like being in a fairy story; one eats some particular thing and gets a child from it. This infantile theory of birth is revived in cases of insanity. A manic woman, for instance, will lead the visiting doctor to a little heap of faeces which she has deposited in a corner of her cell, and say to him with a laugh: 'That's the baby I had today.'

The third of the typical sexual theories arises in children if, through some chance domestic occurrence, they become witnesses to sexual intercourse between their parents. Their perceptions of what is

1 [Cf. a similar remark in the case history of 'Little Hans' (1909*b*), *RSE*, **10**, 71 *n*. 1. It was only later, especially in the 'Wolf Man' analysis (1918*b*), that Freud drew attention to the close connection that can exist between anal erotism and a feminine attitude. See, for instance, ibid., **17**, 73.]

happening are bound, however, to be only very incomplete. Whatever detail it may be that comes under their observation – whether it is the relative positions of the two people, or the noises they make, or some accessory circumstance – children arrive in every case at the same conclusion. They adopt what may be called a *sadistic view* [*Auffassung*][T] *of coition*. They see it as something that the stronger participant is forcibly inflicting on the weaker, and they (especially boys) compare it to the romping familiar to them from their childish experience – romping which, incidentally, is not without a dash of sexual excitation. I have not been able to ascertain that children recognize this behaviour which they have witnessed between their parents as the missing link needed for
[221] solving the problem of babies; it appears more often that the connection is overlooked by them for the very reason that they have interpreted [*Deutung*][T] the act of love as an act of violence. But this view of it itself gives an impression of being a return of the obscure impulse [*Impulses*] towards cruel behaviour which became attached to the excitations of the child's penis when he first began to think about the problem of where babies came from [cf. above, p. 190]. The possibility, too, cannot be excluded that this premature sadistic impulse, which might so nearly have led to the discovery of coition, itself first emerged under the influence of extremely obscure memories of parental intercourse, for which the child had obtained the material – though at the time he made no use of it – while he was still in his first years and was sharing his parents' bedroom.[1]

The sadistic theory of coitus, which, taken in isolation, is misleading where it might have provided confirmatory evidence, is, once again, the expression of one of the innate components of the sexual drive, any of which may be strongly marked to a greater or lesser degree in each particular child. For this reason the theory is correct up to a certain point; it has in part divined the nature of the sexual act and the 'sex battle' that precedes it. Not infrequently, too, the child is in a position to support this view by accidental observations which he understands in part correctly, but also in part incorrectly and indeed in a reversed sense. In many marriages the wife does in fact recoil from her husband's embraces, which bring her no pleasure [*Lust*][T], but the risk of a fresh pregnancy. And so the child who is believed to be asleep (or who is pretending to be asleep) may receive an impression from his mother which he can only

1 Restif de la Bretonne, in his autobiographical work *Monsieur Nicolas* (1794), tells a story of an impression he received at the age of four, which confirms this sadistic misunderstanding of coitus. – [This question came up for lengthy discussion some ten years later, in Freud's 'Wolf Man' case history. (See, in particular, *RSE*, **17**, 43 ff.)]

interpret as meaning that she is defending herself against an act of violence. At other times the whole marriage offers an observant child the spectacle of an unceasing quarrel, expressed in loud words and [222]
unfriendly gestures; so that he need not be surprised if the quarrel is carried on at night as well, and finally settled by the same method which he himself is accustomed to use in his relations with his brothers and sisters or playmates.

Moreover, if the child discovers spots of blood in his mother's bed or on her underclothes, he regards it as a confirmation of his view. It proves to him that his father has made another similar assault on his mother during the night (whereas we should rather take the fresh spots of blood to mean that there had been a temporary cessation of sexual intercourse). Much of the otherwise inexplicable 'horror of blood' shown by neurotics finds its explanation from this connection. Once again, however, the child's mistake contains a fragment of truth. For in certain familiar circumstances a trace of blood is in fact judged as a sign that sexual intercourse has been begun.

A question connected somewhat indirectly with the insoluble problem of where babies come from also engages the child – the question as to the nature and content of the state called 'being married'; and he answers the question differently according to how his chance perceptions in relation to his parents have coincided with drives of his own which are still pleasurably coloured. All that these answers seem to have in common is that the child promises himself pleasurable satisfaction from being married and supposes that it involves a disregard of modesty. The notion I have most frequently met with is that *each of the married couple urinates in front of the other*. A variation of this, which sounds as if it was meant to indicate a greater knowledge symbolically, is that *the man urinates into the woman's chamber-pot*. In other instances the meaning of marriage is supposed to be that *the two people show their behinds to each other* (without being ashamed). In one case, in which education had succeeded in postponing sexual knowledge especially late, a fourteen-year-old girl, who had already begun to menstruate, arrived from the books she had read at the idea that being married consisted in a 'mixing of blood'; and since her own sister had [223]
not yet started her periods, the lustful girl made an assault on a female visitor who had confessed that she was just then menstruating, so as to force her to take part in this 'blood-mixing'.

Childhood opinions about the nature of marriage, which are not seldom retained by conscious memory, have great significance for the

symptomatology of later neurotic illness. At first they find expression in children's games in which each child does with another whatever it is that in his view constitutes being married; and then, later on, the wish to be married may choose the infantile form of expression and so make its appearance in a phobia which is at first sight unrecognizable, or in some corresponding symptom.[1]

These seem to be the most important of the typical sexual theories that children produce spontaneously in early childhood, under the sole influence of the components of the sexual drive. I know that I have not succeeded in making my material complete or in establishing an unbroken connection between it and the rest of infantile life. But I may add one or two supplementary observations, whose absence would otherwise be noticed by any well-informed person. Thus, for instance, there is the significant theory that a baby is got by a kiss – a theory which obviously betrays the predominance of the erotogenic zone of the mouth. In my experience this theory is exclusively feminine and is sometimes found to be pathogenic in girls whose sexual researches have been subjected to exceedingly strong inhibitions in childhood. Again, through an accidental observation, one of my women patients happened upon the theory of the 'couvade', which, as is well known, is a general custom among some races and is probably intended to contradict the doubts as to paternity which can never be entirely overcome. A rather eccentric uncle of this patient's stayed at home for
[224] days after the birth of his child and received visitors in his dressing-gown, from which she concluded that both parents took part in the birth of their children and had to go to bed.

In about their tenth or eleventh year, children get to hear about sexual matters. A child who has grown up in a comparatively uninhibited [*ungehemmteren*] social atmosphere, or who has found better opportunities for observation, tells other children what he knows, because this makes him feel mature and superior. What children learn in this way is mostly correct – that is, the existence of the vagina and its purpose is revealed to them; but otherwise the explanations they get from one another are not infrequently mixed with false ideas and burdened with remains of the older infantile sexual theories. They are scarcely ever complete or sufficient to solve the primordial problem. Just as formerly it was ignorance of the vagina which prevented the whole process from being understood, so now it is ignorance of the semen. The child cannot

1 The games that are most significant for subsequent neuroses are playing at 'doctor' and at 'father and mother'.

guess that another substance besides urine is excreted from the male sexual organ, and occasionally an 'innocent' girl on her wedding night is still indignant at her husband 'urinating into her'. This information acquired in the years of prepuberty is followed by a new access to sexual researches by the child. But the theories which he now produces no longer have the typical and original stamp which was characteristic of the primary theories of early childhood as long as the infantile sexual components could find expression in theories in an uninhibited and unmodified fashion. The child's later intellectual efforts at solving the puzzles of sex have not seemed to me worth collecting, nor can they have much claim to a pathogenic significance. Their multiplicity is of course mainly dependent on the nature of the enlightenment which a child receives; but their significance consists rather in the fact that they reawaken the traces, which have since become unconscious, of his first period of sexual interest; so that it is not infrequent for masturbatory sexual activity and some degree of emotional detachment from his parents to be linked up with them. Hence the condemnatory judgement [225] of teachers that enlightenment of such a kind at this age 'corrupts' children.

Let me give a few examples to show what elements often enter into these late speculations by children about sexual life. A girl had heard from her schoolmates that the husband gives his wife an egg, which she hatches out in her body. A boy, who had also heard of the egg, identified it with the testicle, which [in German] is vulgarly called by the same word [*Ei*]; and he racked his brains to make out how the contents of the scrotum could be constantly renewed. The information given seldom goes far enough to prevent important uncertainties about sexual events. Thus a girl may arrive at an expectation that intercourse occurs on one occasion only, but that it lasts a very long time – twenty-four hours – and that all the successive babies come from this single occasion. One would suppose that this child had got her knowledge of the reproductive process from certain insects; but it turned out that this was not so and that the theory emerged as a spontaneous creation. Other girls are ignorant of the period of gestation, the life in the womb, and assume that the baby appears immediately after the first night of intercourse. Marcel Prévost has turned this girlhood mistake into an amusing story in one of his '*Lettres de femmes*'.[1] These later sexual researches of children, or of adolescents who have been retarded at the stage of childhood, offer an almost inexhaustible theme and one which is perhaps not uninteresting

1 [Cf. Prévost, 'La nuit de Raymonde', *Nouvelles lettres de femmes*.]

in general; but it is more remote from my present interest. I must only lay stress on the fact that in this field children produce many incorrect ideas in order to contradict older and better knowledge which has become unconscious and is repressed.

The way in which children react to the information they are given also has its significance. In some, sexual repression has gone so far that they will not listen to anything; and these succeed in remaining ignorant even in later life – *apparently* ignorant, at least – until, in the psycho-
[226] analysis of neurotics, the knowledge that originated in early childhood comes to light. I also know of two boys between ten and thirteen years old who, though it is true that they listened to the sexual information, rejected it with the words: '*Your* father and other people may do something like that, but I know for certain *my* father never would.'[1] But however widely children's later reactions to the satisfaction of their sexual curiosity may vary, we may assume that in the first years of childhood their attitude was absolutely uniform, and we may feel certain that at that time all of them tried most eagerly to discover what it was that their parents did with each other so as to produce babies.

1 [This anecdote was repeated by Freud in his somewhat later paper on a special type of object choice (1910*h*), *RSE*, **11**, 158, where some further remarks on the present subject can be found.]

SOME GENERAL REMARKS ON HYSTERICAL ATTACKS

(1909 [1908])

The present translation is a revised and corrected reprint of the *SE* version.

This paper was contributed by Freud at the invitation of Albert Moll to the first number of a new periodical which he was founding. Some months earlier, on April 8, 1908, Freud had spoken on the same subject at a meeting of the Vienna Psychoanalytical Society. His last published discussion of it had been in Section IV of the Breuer & Freud 'Preliminary Communication' (1893*a*) to the *Studies on Hysteria* (1895*d*), *RSE*, **2**. The present paper is one of those highly condensed, almost schematic, works in which we can detect the seeds of later developments. (See especially Section B.) But Freud did not return again to the actual theme of hysterical attacks till twenty years later, in his discussion of Dostoevsky's 'epileptic' attacks (1928*b*), ibid., **21**.

SOME GENERAL REMARKS ON HYSTERICAL ATTACKS

A

When one carries out the psychoanalysis of a hysterical woman patient whose complaint is manifested in attacks, one soon becomes convinced that these attacks are nothing else but phantasies [*Phantasien*][T] translated [*übersetzte*][T] into the motor sphere, projected on to motility and portrayed in pantomime. It is true that the phantasies are unconscious; but apart from this they are of the same nature as the phantasies which can be observed directly in daydreams or which can be elicited by interpretation [*Deutung*][T] from dreams at night. Often a dream takes the place of an attack,[1] and still more often it explains it, since the same phantasy finds a different expression in a dream and in an attack. We might expect then that by observing an attack we should be able to get to know the phantasy represented in it; but this is seldom possible. As a rule, owing to the influence of the censorship, the pantomimic portrayal of the phantasy has undergone distortions which are completely analogous to the hallucinatory distortions of a dream, so that both of them have, in the first resort, become unintelligible to the subject's own consciousness as well as to the observer's comprehension. A hysterical attack, therefore, needs to be subjected to the same interpretative revision [*Bearbeitung*] as we employ for night dreams. But not only are the forces [*Mächte*][T] from which the distortion proceeds and the purpose of the distortion the same as those we have come to know through the interpretation of dreams; the technique employed in the distortion is the same too. [229] *Übersetzung*

(1) The attack becomes unintelligible through the fact that it represents several phantasies in the same material simultaneously – that is to say through *condensation* [*Verdichtung*][T]. The elements common to the two (or more) phantasies constitute the nucleus of the representation, as they [230]

1 [A footnote to this effect was added in 1909 to *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 442 *n.*]

do in dreams. The phantasies which are thus made to coincide [*zur Deckung gebrachten*] are often of quite a different nature. They may, for instance, be a recent wish and the reactivation of an infantile impression. The same innervations are in that case made to serve both purposes, often in a most ingenious way. Hysterical patients who make a very extensive use of condensation may find a single form of attack sufficient; others express their numerous pathogenic phantasies by a multiplication of the forms of attack.

(2) The attack becomes obscured through the fact that the patient attempts to carry out the activities of both the figures who appear in the phantasy, that is to say, through *multiple identification*. Compare, for instance, the example I mentioned in my paper on 'Hysterical Phantasies and their Relation to Bisexuality' (1908*a*), in which the patient tore off her dress with one hand (as the man) while she pressed it to her body with the other (as the woman).[1]

(3) A particularly extensive distortion is effected by an *antagonistic inversion of the innervations*. This is analogous to the transformation of an element into its opposite, which commonly happens in the dream-work.[2] For instance, an embrace may be represented in the attack by drawing back the arms convulsively till the hands meet over the spinal column. It is possible that the well-known *arc de cercle* which occurs during attacks in major hysteria is nothing else than an energetic repudiation like this, through antagonistic innervation, of a posture of the body that is suitable for sexual intercourse.

(4) Scarcely less confusing and misleading is a *reversal of the chronological order* within the phantasy that is portrayed, which once more has its complete counterpart in a number of dreams which begin with the end [231] of the action and end with its beginning. Supposing, for instance, that a hysterical woman has a phantasy of seduction in which she is sitting reading in a park with her skirt slightly lifted so that her foot is visible; a gentleman approaches and speaks to her; they then go somewhere and make love to one another. This phantasy is acted out in the attack by her beginning with the convulsive stage, which corresponds to the coitus, by her then getting up, going into another room, sitting down and reading and presently answering an imaginary remark addressed to her.[3]

The two last-mentioned forms of distortion give us some idea of the intensity of the resistances which the repressed material must take into account even when it breaks through in a hysterical attack.

1 [See above, p. 142.]

2 [Cf. a passage added to *The Interpretation of Dreams* in 1909; *RSE*, **4**, 291 f.]

3 [A fuller and slightly different account of this example was added as a footnote to *The Interpretation of Dreams* in 1909; ibid., **4**, 292 *n.* 1.]

B

The onset of hysterical attacks follows laws that are easily understandable. Since the repressed [*verdrängte*][T] complex consists of a libidinal cathexis [*Libidobesetzung*][T] and an ideational content [*Vorstellungsinhalt*][T] (the phantasy),[1] the attack can be evoked (1) *associatively*, when the content of the complex (if sufficiently cathected) is touched on by something connected with it in conscious life; (2) *organically*, when, for internal somatic reasons and as a result of psychical influences from outside, the libidinal cathexis rises above a certain degree; (3) in the service of the *primary purpose* – as an expression of a 'flight into illness', when reality becomes distressing or frightening – that is, as a *consolation*; (4) in the service of the *secondary purposes*, with which the illness allies itself, as soon as, by producing an attack, the patient can achieve an aim that is useful to him.[2] In the last case the attack is directed at particular individuals; it can be put off till they are present, and it gives an impression of being consciously simulated.

Verdrängung
Besetzung
Vorstellung
[232]

C

Investigation of the childhood history of hysterical patients shows that the hysterical attack is designed to take the place of an *auto-erotic* satisfaction previously practised and since given up. In a great number of cases this satisfaction (masturbation by contact or by pressure of the thighs, or, again, by movements of the tongue, and so on) recurs during the attack itself, while the subject's consciousness is deflected. Moreover, the onset of an attack that is due to an increase of libido and is in the service of the primary purpose – as a consolation – exactly repeats the conditions under which, at the earlier time, the patient had intentionally

1 [The distinction indicated here between ideational content and affective energy was to play an important part in Freud's metapsychological account of repression (1915*d* and 1915*e*), *RSE*, **14**, 135–9 and 161–4. See also the Editors' Appendix to 'The Neuropsychoses of Defence' (1894*a*), ibid., **3**, 57 ff.]

2 [This seems to be the first appearance of the actual term 'flight into illness', though the notion was an old one of Freud's, and the phrase 'flight into psychosis' occurs in Section III of the first of his papers on 'The Neuropsychoses of Defence' (1894*a*). (The phrase 'flight into neurotic illness' appears in the paper on 'civilized' sexual morality (1908*d*), p. 168 above.) The idea of a 'gain from illness' as an aetiological factor was also an old one. It appears, for instance, in a letter to Fliess of November 18, 1897 (Freud, 1950*a*, Letter 76). But the distinction between a 'primary' and 'secondary' gain is first made clearly in the present passage. The specific term 'secondary gain from illness' was introduced in the technical paper 'On Beginning the Treatment' (1913*c*), *RSE*, **12**, 130. The whole question was fully discussed in Lecture XXIV of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 338 f., and again in a footnote added in 1923 to the 'Dora' case history (1905*e*), ibid., **7**, 39, in which Freud corrects and clarifies his earlier views on the subject.]

sought this auto-erotic satisfaction.[1] The anamnesis of the patient shows the following stages: (*a*) auto-erotic satisfaction, without ideational con-
[233] tent; (*b*) the same satisfaction, connected with a phantasy which leads to the act of satisfaction; (*c*) renunciation of the act, with retention of the phantasy; (*d*) repression of the phantasy, which then comes into effect as a hysterical attack, either in an unchanged form, or in a modified one and adapted to new environmental impressions. Furthermore, (*e*) the phantasy may even reinstate the act of satisfaction belonging to it which had ostensibly been given up. This is a typical cycle of infantile sexual activity: repression, failure of repression, and return of the repressed.

The involuntary passing of urine is certainly not to be regarded as incompatible with the diagnosis of a hysterical attack; it is merely repeating the infantile form of a violent pollution. Moreover, biting the tongue may also be met with in undoubted cases of hysteria. It is no more inconsistent with hysteria than it is with love-making. It occurs more readily in attacks if the patient's attention had been drawn by the doctor's questions to the difficulties of making a differential diagnosis. Self-injury may occur in hysterical attacks (more frequently in the case of men) where it repeats an accident in childhood – as, for instance, the result of a romp.

The loss of consciousness, the '*absence*',[2] in a hysterical attack is derived from the fleeting but unmistakable lapse of consciousness [*Bewusstseinsentgang*][t] which is observable at the climax of every intense sexual satisfaction, including auto-erotic ones. This course of development can be traced with most certainty where hysterical *absences* arise from the onset of pollutions in young people of the female sex. The so-called 'hypnoid states'[3] – *absences* during daydreaming – which are so common in hysterical subjects, show the same origin. The mechanism of these *absences* is comparatively simple. All the subject's attention is concentrated to begin with on the course of the process of satisfaction; with the occurrence of the satisfaction, the whole of this cathexis of
[234] attention is suddenly removed, so that there ensues a momentary void in her consciousness. This gap in consciousness, which might be termed a *physiological* one, is then widened in the service of repression, till it can swallow up everything that the repressing agency rejects.

1 [In a passage in Lecture XXV of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 349, Freud speaks of the hysterical attack as 'the precipitate of a reminiscence' and suggests that normal affects are constructed on the same pattern.]

2 [The French neurological term.]

3 [Breuer's term. See *Studies on Hysteria* (1895*d*), ibid., **2**, xxii and xxiv.]

D

What points the way for the motor discharge [*Abfuhr*][T] of the repressed libido in a hysterical attack is the reflex mechanism of the act of coition – a mechanism which is ready to hand in everybody, including women, and which we see coming into manifest operation when an unrestrained surrender is made to sexual activity. Already in ancient times coition was described as a 'minor epilepsy'. We might alter this and say that a convulsive hysterical attack is an equivalent of coition. The analogy with an epileptic fit helps us little, since its genesis is even less understood than that of hysterical attacks.[1]

Speaking as a whole, hysterical attacks, like hysteria in general, revive a piece of sexual activity in women which existed during their childhood and at that time revealed an essentially masculine character. It can often be observed that girls who have shown a boyish nature and inclinations up to the years before puberty are precisely those who become hysterical from puberty onwards. In a whole number of cases the hysterical neurosis merely represents an excessive accentuation of the typical wave of repression which, by doing away with her masculine sexuality, allows the woman to emerge.[2]

1 [Cf. Freud's lengthy discussion of the 'epileptic reaction' and the relation between epilepsy and hysterical attacks in his paper on Dostoevsky (1928*b*), *RSE*, **21**, 168 ff.]

2003 *PMC*, *The Uncanny*, 35–41. (Tr. David McLintock.)

The present translation is a revised and corrected reprint of the *SE* version.

When this first appeared, in Rank's book, it bore no heading of any kind and did not form a separate section. It was simply introduced into the course of Rank's argument with a few words of acknowledgement. The work was only given a title in German when it was first reprinted. Since the preface to Rank's book is dated 'Christmas, 1908', Freud's contribution was probably written in that year. The idea of these 'family romances', and even their name, had long been in his mind – though at first he attributed them specially to paranoics. See his letters to Fliess of January 24, and May 25, 1897, and June 20, 1898 (Freud, 1950*a*, Letter 57, Draft M, and Letter 91 where the term is first used; *RSE*, **1**, 271 *n.* 2).

FAMILY ROMANCES

The liberation of an individual, as he grows up, from the authority of his [237]
parents is one of the most necessary though one of the most painful results brought about by the course of his development. It is quite essential that that liberation should occur and it may be presumed that it has been to some extent achieved by everyone who has reached a normal state. Indeed, the whole progress of society rests upon the opposition between successive generations. On the other hand, there is a class of neurotics whose condition is recognizably determined by their having failed in this task.

For a small child his parents are at first the only authority and the source of all belief. The child's most intense and most momentous wish during these early years is to be like his parents (that is, the parent of his own sex) and to be big like his father and mother. But as intellectual growth increases, the child cannot help discovering by degrees the category to which his parents belong. He gets to know other parents and compares them with his own, and so acquires the right to doubt the incomparable and unique quality which he had attributed to them. Small events in the child's life which make him feel dissatisfied afford him provocation for beginning to criticize his parents, and for using, in order to support his critical attitude, the knowledge which he has acquired that other parents are in some respects preferable to them. The psychology of the neuroses teaches us that, among other factors, the most intense impulses of sexual rivalry contribute to this result. A feeling of being slighted is obviously what constitutes the subject matter of such provocations. There are only too many occasions on which a child is slighted, or at least *feels* he has been slighted, on which he feels he is not receiving the whole of his parents' love, and, most of all, on which he feels regrets at having to share it with brothers and sisters. His sense that [238]
his own affection is not being fully reciprocated then finds a vent in the idea [*Idee*], often consciously recollected later from early childhood, of being a stepchild or an adopted child. People who have not developed

neuroses very frequently remember such occasions, on which – usually
Auffassung as a result of something they have read – they interpreted [*auffassten*][T] and responded to their parents' hostile behaviour in this fashion. But here the influence of sex [*Geschlechts*][T] is already in evidence, for a boy is far more inclined to feel hostile impulses [*Regungen*][T] towards his father than towards his mother and has a far more intense desire to get free from *him* than from *her*. In this respect the imagination of girls is apt to show itself much weaker. These consciously remembered mental impulses of childhood embody the factor which enables us to understand the nature of myths.

The later stage in the development of the neurotic's estrangement from his parents, begun in this manner, might be described as 'the neurotic's family romance'. It is seldom remembered consciously but can almost always be revealed by psychoanalysis. For a quite peculiarly marked imaginative [*Phantasie*][T] activity is one of the essential characteristics of neurotics and also of all comparatively highly gifted people. This activity emerges first in children's play, and then, starting roughly from the period before puberty, takes over the topic of family relations. A characteristic example of this peculiar imaginative activity is to be seen in the familiar daydreaming[1] which persists far beyond puberty. If these daydreams are carefully examined, they are found to serve as the fulfilment of wishes and as a correction of actual life. They have two principal aims, an erotic and an ambitious one – though an erotic aim is usually concealed behind the latter too. At about the period I have mentioned, then, the child's imagination [*Phantasie*] becomes engaged in the task of getting free from the parents of whom he now has a low opinion and of
[239] replacing them with others, who, as a rule, are of higher social standing. He will make use in this connection of any opportune coincidences from his actual experience, such as his becoming acquainted with the lord of the manor or some landed proprietor if he lives in the country or with some member of the aristocracy if he lives in town. Chance occurrences of this kind arouse the child's envy, which finds expression in a phantasy in which both his parents are replaced by others of better birth. The technique used in developing phantasies like this (which are, of course, conscious at this period) depends upon the ingenuity and the material which the child has at his disposal. There is also the question of whether the phantasies are worked out with greater or lesser effort to obtain

1 Cf. 'Hysterical Phantasies and their Relation to Bisexuality' [1908*a*], where a reference can be found to the literature of the subject. [See above, p. 137.]

verisimilitude. This stage is reached at a time at which the child is still in ignorance of the sexual [*sexuellen*] determinants of procreation.

When presently the child comes to know the difference in the parts played by fathers and mothers in their sexual relations, and realizes that '*pater semper incertus est*', while the mother is '*certissima*',[1] the family romance undergoes a curious curtailment: it contents itself with exalting the child's father, but no longer casts any doubts on his maternal origin, which is regarded as something unalterable. This second (sexual) stage of the family romance is actuated by another motive [*Motiv*][T] as well, which is absent in the first (asexual) stage. The child, having learnt about sexual [*geschlechtlichen*] processes, tends to picture to himself erotic situations and relations, the driving force [*Triebkraft*][T] behind *Trieb*
this being his desire to bring his mother (who is the subject of the most intense sexual [*sexuellen*] curiosity) into situations of secret infidelity and into secret love affairs.[2] In this way the child's phantasies, which started by being, as it were, asexual, are brought up to the level of his later knowledge.

Moreover, the motive of revenge and retaliation, which was in the [240]
foreground at the earlier stage, is also to be found at the later one. It is, as a rule, precisely these neurotic children who were punished by their parents for sexual naughtiness and who now revenge themselves on their parents by means of phantasies of this kind.

A younger child is very specially inclined to use imaginative stories [*Dichtungen*] such as these in order to rob those born before him of their prerogatives – in a way which reminds one of historical intrigues; and he often has no hesitation in attributing to his mother as many fictitious love affairs as he himself has competitors. An interesting variant of the family romance may then appear, in which the hero and author returns to legitimacy himself while his brothers and sisters are eliminated by being bastardized. So too if there are any other particular interests at work they can direct the course to be taken by the family romance; for its many-sidedness and its great range of applicability enable it to meet every sort of requirement. In this way, for instance, the young phantasy-builder can get rid of his forbidden degree of kinship with one of his sisters if he finds himself sexually attracted by her.[3]

If anyone is inclined to turn away in horror from this depravity of the

1 [An old legal tag: 'paternity is always uncertain, maternity is most certain.']

2 [Freud returned to this in the first of his papers on the psychology of love (1910*h*), *RSE*, **11**, 158–9.]

3 [This last point is found in Freud's letter to Fliess of June 20, 1898 (Freud, 1950*a*, Letter 91).]

childish heart or feels tempted, indeed, to dispute the possibility of such things, he should observe that these works of fiction, which seem so full of hostility, are none of them really so badly intended, and that they still preserve, under a slight disguise, the child's original affection for his parents. The faithlessness and ingratitude are only apparent. If we examine in detail the commonest of these imaginative romances, the replacement of both parents or of the father alone with grander people, we find that these new and aristocratic parents are equipped with attributes that are derived entirely from real recollections of the actual and humble ones; so that in fact the child is not getting rid of his father but
[241] exalting him. Indeed the whole effort at replacing the real father with a superior one is only an expression of the child's longing for the happy, vanished days when his father seemed to him the noblest and strongest of men and his mother the dearest and loveliest of women. He is turning away from the father whom he knows today to the father in whom he believed in the earlier years of his childhood; and his phantasy is no more than the expression of a regret that those happy days have gone. Thus in these phantasies the overvaluation that characterizes a child's earliest years comes into its own again. An interesting contribution to this subject is afforded by the study of dreams. We learn from their interpretation that even in later years, if the emperor and empress appear in dreams, those exalted personages stand for the dreamer's father and mother.[1] So that the child's overvaluation of his parents survives as well in the dreams of normal adults.

1 Cf. my *Interpretation of Dreams*, 1900*a* [*RSE*, **5**, 316].

Shorter Writings

(1906–09)

CONTRIBUTION TO A QUESTIONNAIRE ON READING[1]

(1906)

You ask me to name 'ten good books' for you, and refrain from adding to [245]
this any word of explanation. Thus you leave to me not only the choice of the books but also the interpretation [*Auslegung*] of your request. Accustomed to paying attention to small signs, I must then trust the wording in which you couch your enigmatical demand. You did not say: 'the ten most magnificent works (of world literature)', in which case I should have been obliged to reply, with so many others: Homer, the tragedies of Sophocles, Goethe's *Faust*, Shakespeare's *Hamlet*, *Macbeth*, etc. Nor did you say the 'ten most significant books', among which scientific achievements like those of Copernicus, of the old physician Johann Weier on the belief in witches, Darwin's *Descent of Man*, and others, would then have found a place. You did not even ask for 'favourite books', among which I should not have forgotten Milton's *Paradise Lost* and Heine's *Lazarus*. I think, therefore, that a particular stress falls on the 'good' in your phrase, and that with this predicate you intend to designate books to which one stands in rather the same relationship as to [246]
'good' friends, to whom one owes a part of one's knowledge of life and view of the world [*Weltanschauung*] – books which one has enjoyed oneself and gladly commends to others, but in connection with which the element of timid reverence, the feeling of one's own smallness in the face of their greatness, is not particularly prominent.

1 [First published in *Vom Lesen und von guten Büchern: Eine Rundfrage*, in *Neue Blätter für Literatur u. Kunst*, ed. Hugo Heller, Heft 1, December, 1906, vii. Reprinted in the brochure: *Jahrbuch deutscher Bibliophilen und Literaturfreunde*, ed. H. Feigl, Zürich and Leipzig, **16–17** (1931), 117–19. Also in *GW*, **Nachtr.**, 662–4. English translation by K. R. Eissler in Eissler, 'An Unknown Autobiographical Letter by Freud and a Short Comment', *Int. J. Psycho-Anal.*, **32** (1951), 319–20; reprinted in Jones, 1957, 452–4. A translation by James Strachey, based on the one published in 1951, was published in 1959 in *SE*, **9**, 245–7. The present translation is a revised and corrected reprint of the *SE* version.

Replies from thirty-two distinguished people to this questionnaire, instigated by the publisher Hugo Heller, appeared in the brochure of 1907. It was introduced by a letter from Hugo von Hofmannsthal and included contributions from Peter Altenberg, Hermann Bahr, August Forel, Hermann Hesse, Ernst Mach, Thomas Masaryk, Arthur Schnitzler and Jakob Wassermann.]

I will therefore name ten such 'good' books for you which have come to my mind without a great deal of reflection.

Multatuli, Letters and Works. [Cf. p. 112 *n*. above.]
Kipling, *Jungle Book*.
Anatole France, *Sur la pierre blanche*.
Zola, *Fécondité*.
Merezhkovsky, *Leonardo da Vinci*.
G. Keller, *Leute von Seldwyla*.
C. F. Meyer, *Huttens letzte Tage*.
Macaulay, *Essays*.
Gomperz, *Griechische Denker*.
Mark Twain, *Sketches*.

I do not know what you intend to do with this list. It seems a most peculiar one even to me; I really cannot let it go without comment. The problem of why precisely these and not other equally 'good' books I will not begin to tackle; I merely wish to throw light on the relation between the author and his work. The connection is not in every case as firm as it is, for instance, with Kipling's *Jungle Book*. For the most part I could just as well have singled out another work by the same author – for instance, in the case of Zola, *Docteur Pascal* – and the like. The same man who has given us one good book has often presented us with several good books. In the case of Multatuli I felt in two minds whether to reject the private letters in favour of the 'Love Letters' or the latter in favour of the former, and for that reason wrote: 'Letters and Works'. Genuinely creative writing [*Dichtungen*] of purely poetical [*poetischem*] value has been excluded from this list, probably because your charge – good books – did
[247] not seem exactly aimed at such; for in the case of C. F. Meyer's *Hutten* I must set its 'goodness' far above its beauty: 'edification' above aesthetic enjoyment.

You have touched on something, with your request to name for you 'ten good books', on which an immeasurable amount could be said. And so I will conclude, in order not to become even more informative.

Yours sincerely,
FREUD

PROSPECTUS FOR *SCHRIFTEN ZUR ANGEWANDTEN SEELENKUNDE*[1]

(1907)

The *Schriften zur angewandten Seelenkunde*, the first number of which is published herewith, are aimed at that wider circle of educated people who without actually being philosophers or medical men are nevertheless able to appreciate the science of the human mind [*Seelischen des Menschen*][T] for its significance in the understanding and deepening of life.[2] The papers[3] will appear in no prescribed order, but will present in each instance[4] a single study, which will undertake the application of psychological knowledge to subjects in art and literature, in the history of civilizations [*Kulturgeschichte*][T] and religions, and in analogous fields.[5] These studies will sometimes bear the character of exact investigations, sometimes that of speculative efforts, attempting now to embrace a larger problem, now to penetrate into a more restricted one; but in every case they will be in the nature of original achievements and will avoid resembling mere reviews or compilations. [248] *Seele* *Kultur*

The Editor feels himself in duty bound to vouch for the originality and general merit of the articles appearing in this series. For the rest, he does not wish either to interfere with the independence of his contributors or to be held answerable for what they express. The fact [249]

1 ['Papers on Applied Mental Science.' In Heller edition of *Der Wahn und die Träume in W. Jensens 'Gradiva'* (Freud, 1907*a*), Vienna, 82. Revised version in 1908 Deuticke edition (see below). Both versions reprinted in *GW*, **Nachtr.**, 695–6. English translation by H. A. Bunker, 'Introduction to *Schriften zur angewandten Seelenkunde*', in I. Bry, H. Bayne and M. Elbert, 'Ex Libris I. Early Monographic Series', *Bull. Am. Psa. Ass.*, **8** (1952), 214–15; reprinted *J. Am. Psa. Ass.*, **1** (1953), 519–20. A modified version of the 1952 translation was published in 1959 in *SE*, **9**, 248–9. The present translation is a revised and corrected reprint of the *SE* version.

Twenty books were published in the series of *Schriften zur angewandten Seelenkunde* between 1907 and 1925. The first volume was published by Hugo Heller and reissued a year later by Franz Deuticke, who published all subsequent volumes. The Deuticke edition was unchanged, apart from the 'Prospectus' itself, which was very slightly altered and shortened. Apart from Freud's work on Jensen's *Gradiva* the series also included his study on Leonardo (1910*c*), as well as works by, among others, Riklin, Jung, Abraham, Rank, Sadger, Pfister, Ernest Jones and Storfer.]

2 ['our lives' in the 1908 version.]

3 ['volumes' in the 1908 version.]

4 ['in most instances' in the 1908 version.]

5 [The 1908 version ends here.]

that the first numbers of the series take particular account of the theories which he himself has advocated in the sphere of science should not determine the view taken of this enterprise. On the contrary, the series is open to the exponents of divergent opinions and hopes to be able to give expression to the variety of points of view and principles in contemporary science.

THE PUBLISHER THE EDITOR

PREFACE TO WILHELM STEKEL'S *NERVOUS ANXIETY STATES AND THEIR TREATMENT*[1]

(1908)

My investigations into the aetiology and psychical mechanism of [250]
neurotic illnesses, which I have pursued since 1893, attracted little notice to begin with among my fellow specialists. At length, however, those investigations have met with recognition from a number of medical research workers and have also drawn attention to the psychoanalytic methods of examination and treatment to which I owe my findings. Dr Wilhelm Stekel, who was one of the first of the colleagues to whom I was able to impart a knowledge of psychoanalysis, and who has himself become familiar with its technique through many years of practice in it, has now undertaken the task of working over one topic in the clinical aspect of these neuroses on the basis of my views and of presenting medical readers with the experiences he has obtained through the psychoanalytic method. If I am glad to take the responsibility for his work in the sense which I have just indicated, I think it is only right to declare explicitly that my direct influence upon the volume on nervous states of anxiety which lies before us has been a very slight one. The observations and all the detailed opinions and interpretations are the author's own. My share has been limited to proposing the use of the term 'anxiety hysteria'.[2]

I will add that Dr Stekel's work is founded upon rich experience and [251]
is calculated to stimulate other physicians into confirming by their own efforts our views on the aetiology of these conditions. His work reveals many unexpected glimpses of the realities of life, which so often lie

1 [First published in W. Stekel's *Nervöse Angstzustände und ihre Behandlung*, Berlin and Vienna, 1908, iii; 2nd ed., 1912, v; reprinted *GS*, **11** (1928), 239, and *GW*, **7** (1941), 467–8. Freud's Preface was not included in the later editions of the work. The present translation is a revised reprint of the (1959) one by James Strachey, first published in *SE*, **9**, 250–7.]

2 [*Angsthysterie*.[T] This was Freud's first published use of the term. He entered into the subject fully in his case history of 'Little Hans' (1909*b*), which was produced soon afterwards. Cf. *RSE*, **10**, 88–90. In a discussion of a paper by Stekel at a meeting of the Vienna Psychoanalytical Society on April 24, 1907, Freud made a clear distinction between conversion hysteria and hysteria accompanied by anxiety. At a later meeting, on October 9, 1907, Freud made the distinction clearer still and introduced the actual term 'anxiety hysteria'. (See the *Minutes*, **1**.)] *Angst*

concealed behind neurotic symptoms; and it may well convince our colleagues that the attitude they choose to adopt to the hints and explanations given in these pages cannot be a matter of indifference from the point of view either of their understanding or of their therapeutic efficiency.

Vienna, March, 1908

PREFACE TO SÁNDOR FERENCZI'S *PSYCHOANALYSIS: ESSAYS IN THE FIELD OF PSYCHOANALYSIS*[1]

(1910 [1909])

[252] *Seele Trieb*

Psychoanalytic research into the neuroses (the various forms of nervous illness with a mental [*seelisch*]^{T} causation) has endeavoured to trace their connection with drive activity [*Triebleben*]^{T} and the restrictions imposed on it by the claims of civilization [*Kultur*]^{T}, with the activities of the normal individual in phantasies [*Phantasie*]^{T} and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psychoanalytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

The author of the following essays, who is a close acquaintance of mine, and who is familiar, to an extent that few others are, with all the difficulties of psychoanalytic problems, is the first Hungarian to undertake the task of creating an interest in psychoanalysis among doctors and men of education in his own country through writings composed in their mother tongue. It is our cordial wish that this attempt of his may succeed and may result in gaining for this new field of work new workers from the body of his compatriots.

1 [Date of manuscript: 1909. First published in a Hungarian translation in S. Ferenczi's *Lélekelemzés: Értekezések a pszichoanalizis köréből*, Budapest, 1910*b*, 3–4; 2nd ed., 1914; 3rd ed., 1918. The German original was first published in *GS*, **11** (1928), 241; reprinted *GW*, **7** (1941), 469. The present translation is a revised and corrected reprint of the (1959) one by James Strachey, first published in *SE*, **9**, 252.]

  expectant, 102–3
  in obsessional neurosis, 98, 102–3
  the result of repression, 47, 102, 176
Anxiety dreams, 43–4, 47
  fictitious, in *Gradiva*, 9–10, 15–16, 44, 47, 73
Anxiety hysteria, 221
Anzengruber, *L.*, 128 and *n.* 2
Apollo, 53
Arc de cercle, 202
Ariosto, 123
Aschaffenburg, *G.*, 80
Association experiments, 79–80, 84–6, 87–9
Association of ideas (*see* Free association)
Attention, 86, 204
Auto-erotism (*see also* Masturbation), 113, 138–9, 165, 173, 188
  and hysterical attacks, 203–4

Baby equated with faeces, 191
Babylon, 153 and *n.* 4
Bahr, *H.*, 217 *n.* 1
Baudissin, *Eva*, *Countess*, 75
Beard, *G. M.* (*see also* Bibliography), 161
Bedwetting, 153–4
Berlin, 121
Bertgang, *Richard* (in *Gradiva*), 17–18, 21, 23–6, 29–30, 40, 56, 57–60, 63–4
Bertgang, *Zoe* (in *Gradiva*), 16–75 *passim*
  in role of physician, 16–17, 22, 28, 54, 66, 68–71
Binet, *A.* (*see also* Bibliography), 36
Binswanger, *O. L.* (*see also* Bibliography), 161–2
Biological factors in sexuality, 112–13, 173
Birth, infantile theories of, 114–15, 116, 182, 186–7, 190–1, 194–5
  anal, 182, 190–1
Bisexuality (*see also* Masculine and feminine), 135, 141–3, 202

Bleuler, E. (*see also* Bibliography), 42 *n.* 1, 80, 84
Blood
  fear of, and menstruation, 193
  -mixing theory of 'being married', 193
Boys'
  attitude to parents, 212
  attribution of penis to females, 186–90
Bresler, J., 95
Breuer, J. (*see also* Bibliography), 42, 69, 80, 87, 95, 204 *n.* 3
Brooding, 115, 190
Burghölzli Hospital, 80
Burial as symbol of repression, 4, 31 *n.* 1, 40, 65–6
Buttocks, 152

Capri, 12, 18, 30
Case
  of '*Dora*', 4, 42 *n.* 4, 80 *n.* 1, 85 *n.* 1, 135, 203 *n.* 2
  of '*Little Hans*', 113–14, 181–2, 187 and *n.* 2, 188 *n.* 2, 189 *nn.* 1 & 2, 190 *n.* 2, 191 *n.* 1, 221 *n.* 2
  of *Frau Emmy von N.*, 80
  of '*Rat Man*', 31 *n.* 1, 40 *n.* 1, 95, 104 *n.* 2, 147, 173 *n.* 2, 187 *n.* 1
  of '*Wolf Man*', 45 *n.* 2, 147, 191 *n.* 1, 192 *n.* 1
Case, unnamed
  of bisexuality in hysterical attacks, 142–3, 202
  of obsessional girl rinsing a basin, 99–100
  of woman subject to compulsions, 100–1
  of young mathematician, 27–8
Castration, threat of, 182, 189
Castration complex, 182, 189
  use of term, 189 *n.* 2
Cathartic therapy, 69, 87
Censorship, 45–6, 201
Ceres, 8, 24
Character, 154 *n.* 2
  and anal erotism, 149–52, 153
  effect of masturbation on, 173
  effect of sexual abstinence on, 171
Charcot, J.-M., 42
Chastity (*see* Sexual abstinence)
Chiaramonti, Museo, 75
Childhood impressions
  conscious, 183
  reactivated, 202
  repressed, 23–8, 29, 31, 36–41, 45–6, 183, 202
Children (*see also* Infantile sexual theories; Infantile sexuality)
  and parents, 185–7, 194, 211–14
  capacity for love in, 113
  compared to neurotics, 91
  component drives in, 188, 191, 192, 194–5
  play of, 83, 123–5, 130, 194, 212
  sexual enlightenment of, 111–17, 194–6
  sexual researches of, 112–16, 173, 181–2, 183–96
Chronological reversal
  in dreams, 202
  in hysterical attacks, 202
Civilization
  conflict between drives and, 105, 157–8, 162–76, 223
  increasing demands of, on individuals, 160–2
  purpose of, frustrated by neurosis, 176
  sexual morality imposed by, 157–60, 162–75, 176–7
Classical antiquity

Clitoris, 189
Cloacal theory of birth, 182, 191
Complex
  castration, 182, 189
  nuclear, of neurosis, 187
  Oedipus, 187 *n.* 1
  use of term, 80
Complexes, theory of, 84–92, 163, 184, 203
Component drives, 62, 69, 70, 102–3, 111, 140–1, 150–1, 154, 164, 166

in children, 188, 191, 192, 194–5
Compromise formations
phantasies as, 40–1, 45–6
speeches as, 66–7
symptoms as, 40–2, 45–6, 52, 61–2, 66–7, 70, 103–4, 141–2
Compulsions (*see also* Obsessional acts), 98–102
Condensation
in dreams, 59
in hysterical attacks, 201–2
Conflict
between civilization and drives, 105, 157–8, 162–76, 223
psychical, 40–2, 45–6, 51–2, 54, 102–3, 187
Conscience, 99
Conscientiousness, obsessional, 98–9, 102–3
Consciousness
admissibility to, 62–3, 70, 138
ambiguity as a link between the unconscious and, 66–7
exclusion from, by repression, 37–8, 45, 61, 72, 80, 87
psychoanalysis brings repressed material into, 69–70, 152
Constipation, 152
Contraception, 81, 169, 175, 157 *n*. 1
Conversion, hysterical, 139–40
Copernicus, 217
Coprophilia, 191
Couvade, 194
Creative writers, 6–7, 33–4, 36, 42, 71–2, 74, 121, 123–4, 218
compared to children, 123–5
compared to daydreamers, 128–31
dreams, as treated by, 5–7, 32, 48
Crime, psychology of, 81, 87, 90–1
Criminal and society, 163–4
Criticism renounced by patient in psychoanalysis, 87–8
Culture, use of term, 158

Darwin, *C.*, 217
Daydreams (*see also* Phantasies), 125, 127, 137–8, 201, 204
ambitious in males, erotic in females, 137, 212
creative writing compared to, 128–31
wish fulfilment in, 126–7, 212
Day's residues, 45, 57–8, 59, 72
Death, fear of, 176
Defaecation, pleasure in (*see also* Constipation; Faecal incontinence; Faeces), 150, 151 *n*. 1, 152–4
Defence
obsessional acts as, 102–3
religious observances as, 102
Deferred action (see *Nachträglichkeit*)
Degeneracy, 35, 184
Dekker, *E. D.*, 112 and *n*. 1, 218
Delusions
absurdity of, 55
ambiguity of, 65–7
compared to dreams, 43, 46, 48–9, 65, 67
distortion in, 62–3
genesis and development of, 17, 34–7, 39–46, 47–9, 50–5, 59–63, 71
grain of truth in all, 62–3
hysterical, 35 *n*. 2
paranoic, 35, 137, 140
symbolism of, 31
therapy of, 16–17, 29–30, 36, 39–40, 47, 67, 68–70, 72
Dementia praecox, 115 *n*. 1
Descent of Man (by *C. Darwin*), 217
Determinism, 84–5, 87
Deuticke, *F.*, 219 *n*. 1
Devil, the, personifies repressed life of the drives, 152–3
Disgust, 151
Displacement
from back to front, 151 *n*. 1
in dreams, 45, 104
in obsessional symptoms, 104
of psychical values in religion, 104
of sexual drive, 164
Distortion
in delusions, 62–3
in dreams, 45–6, 48, 57–8, 63, 127, 137–8, 201
in hysterical attacks, 201

Distortion (*cont.*)
in phantasies, 39, 45
Docteur Pascal (by *É. Zola*), 218
'*Dora*', case of (*see* Case of '*Dora*')
Dostoevsky, *F.*, 199, 205 *n.* 1
Dream content, manifest, 45–8, 52, 57, 59–60, 63–4, 89, 140 *n.* 1
Dream interpretation, 5–6, 63–5, 127, 201, 214
technique of, 32, 46–8, 50, 57–8, 89, 201
Dream symbols (*see* Symbols)
Dream thoughts, latent, 46–8, 52, 57, 59–60, 64, 72–3, 89, 140 *n.* 1
Dreams (*see also* Anxiety dreams)
absurdity of, 57, 64
altered in repetition, 89
and delusions, 43, 46, 48–9, 65, 67
and phantasies, 127, 137–8
and sensory stimuli, 6, 10, 43–4
and the unconscious, 223
chronological reversal in, 202
condensation in, 59
displacement in, 45, 104
distortion in, 45–6, 48, 57–8, 63, 127, 137–8, 201
Freud's, of Villa Secerno, 4 *n.* 2
identification in, 58
in fiction, 5–7, 32, 48
mental disturbances and, 43
Norbert Hanold's first, in *Gradiva*, 9–12, 14–16, 19, 32, 41–8, 51–3, 54, 61–3, 68, 72–3
Norbert Hanold's second, in *Gradiva*, 19, 57–60, 63–5, 73
of 'woman with a penis', 188–9
sense of reality in, 45–6
speeches in, 58
understanding of, in classical antiquity, 5–6
wish fulfilment in, 5–6, 48, 71–3, 127
Dream-work, 64, 140 *n.* 1, 202
Drive impulse, 102
use of term, 102 *n.* 2
Drives (*see also* Component drives; Ego drives; Sexual drives)
conflict between civilization and, 105, 157–8, 162–76, 223
repression of, 42, 70, 102–3
Dukatenscheisser, 153

Eckstein, *E.* (*see also* Bibliography), 116
Education (*see also* Sexual enlightenment of children), 151, 166, 171–3, 174–5, 183–4
Ego drives, 105, 185
Ego, the, equated with hero in fiction, 128–9, 131
Ehrenfels, *C. von* (*see also* Bibliography), 159–60, 177

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

ANALYSIS OF A PHOBIA IN A FIVE-YEAR-OLD BOY

(1909)

ENGLISH TRANSLATIONS

'Analysis of a Phobia in a Five-Year-Old Boy'
1925 *CP*, **3**, 149–287. – 'Postscript (1922)', ibid., 288–9. (Tr. Alix and James Strachey.)
1955 *SE*, **10**, 5–147. (Reprint of the 1925 trans., with some alterations and additional notes.)
1977 *PFL*, **8**, 169–305. (Reprint of the *SE* translation.)
2002 *PMC*, *The 'Wolfman' and Other Cases*, 1–122. (Tr. Louise Adey Huish.)

The present translation is a revised and corrected reprint of the *SE* translation.

Some records of the earlier part of 'Little Hans's' life had already been published by Freud two years before, in his paper on 'The Sexual Enlightenment of Children' (1907*c*), *RSE*, **9**. In the earlier editions of that paper, however, the boy was referred to [4] as 'Little Herbert'; but the name was changed to 'Little Hans' after the publication of the present work. This case history is also briefly mentioned in, and, in fact, largely forms the basis of, another of Freud's previous papers, 'On the Sexual Theories of Children' (1908*c*), ibid., **9**, published a short time before this one. It is worth mentioning that on its first publication in the *Jahrbuch* this paper was described not as 'by' Freud, but as 'communicated by' him. In a footnote added by Freud for the eighth volume of the *Gesammelte Schriften* (1924), which contained

this and the four other long case histories, he remarks that this one was published with the express consent of 'Little Hans's' father (a personal friend of Freud's, and member of the Vienna Psychoanalytical Society). This footnote can be found at the end of the 'Prefatory Remarks' to the case of 'Dora' (1905*e*), *RSE*, **7**, 13 *n*. 1.

The case history of 'Little Hans' was later used by Freud as a basis for discussing the nature of anxiety in Chapters IV and VIII of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**. It was also quoted in connection with totemism and animal phobias in *Totem and Taboo* (1912–13*a*), Essay IV, Section 3; ibid., **13**. Further discussions of anxiety and phobias can be found in Lecture XXV of the *Introductory Lectures* (1916–17*a*), ibid., **16**, and in Chapter III of *Inhibitions, Symptoms and Anxiety*, as well as in the 'Wolf Man' case history (1918*b*), ibid., **17**.

The following short chronological table, based on data derived from the case history, may help the reader to follow the story:

1903 (April 10) 'Little Hans' born.
1906 (*Aet*. 3–3¾) First reports.
(*Aet*. 3¼–3½) (Summer) First visit to Gmunden.
(*Aet*. 3½) Castration threat.
(*Aet*. 3½) (October) Hanna born.
1907 (*Aet*. 3¾) First dream.
(*Aet*. 4) Removal to new flat.
(*Aet*. 4¼–4½) (Summer) Second visit to Gmunden. Episode of biting horse.
1908 (*Aet*. 4¾) (January) Episode of falling horse. Outbreak of phobia.
(*Aet*. 5) (May) End of analysis.

Apart from the information that Freud himself provides in his 1922 Postscript (p. 113 below) regarding the later development of 'Little Hans', Mächtlinger (1995) provides an excellent summary of the relevant parts of the patient's own memoirs and those of his father.

ANALYSIS OF A PHOBIA IN A FIVE-YEAR-OLD BOY

I
INTRODUCTION

In the following pages I propose to describe the course of the illness and [5]
recovery of a very youthful patient. The case history is not, strictly speaking, derived from my own observation. It is true that I laid down the general lines of the treatment, and that on one single occasion, when I had a conversation with the boy, I took a direct share in it; but the treatment itself was carried out by the child's father, and it is to him that I owe my sincerest thanks for allowing me to publish his notes upon the case. But his services go further than this. No-one else, in my opinion, could possibly have prevailed on the child to make any such avowals; the special knowledge by means of which he was able to interpret the remarks made by his five-year-old son was indispensable, and without it the technical difficulties in the way of conducting a psychoanalysis upon so young a child would have been insuperable. It was only because the authority of a father and of a physician were united in a single person, and because in him both affectionate care and scientific interest were combined, that it was possible in this one instance to apply the method to a use to which it would not otherwise have lent itself.[1]

But the peculiar value of this observation lies in the considerations [6]
which follow. When a physician treats an adult neurotic by psychoanalysis, the process he goes through of uncovering the psychical formations, layer by layer, eventually enables him to frame certain hypotheses as to the patient's infantile sexuality; and it is in the components of the latter that he believes he has discovered the driving forces

1 [Later experience showed Freud that this limitation was unnecessary. (Cf. the works quoted in the footnote on p. 111 below.) Some further remarks on the theoretical value of child analysis occur near the beginning of the 'Wolf Man' case history (1918*b*), *RSE*, **17**, 8 ff. – It should also be recorded here that, although Freud did not himself conduct any child analyses, he was in his early medical career an accomplished paediatric neurologist. Furthermore, Grubrich-Simitis (1993) reports that his unpublished notes contain numerous fresh, direct observations of children.]

[*Triebkräfte*][T] of all the neurotic symptoms of later life. I have set out these hypotheses in my *Three Essays on the Theory of Sexuality* (1905*d*), and I am aware that they seem as strange to an outside reader as they seem incontrovertible to a psychoanalyst. But even a psychoanalyst may confess to the wish for a more direct and less roundabout proof of these fundamental theorems. Surely there must be a possibility of observing in children at first hand and in all the freshness of life the sexual impulses and wishes which we dig out so laboriously in adults from among their own debris – especially as it is also our belief that they are the common property of all men, a part of the human constitution, and merely exaggerated or distorted in the case of neurotics.

With this end in view I have for many years been urging my pupils and my friends to collect observations of the sexual life of children – the existence of which has as a rule been cleverly overlooked or deliberately denied. Among the material which came into my possession as a result of these requests, the reports which I received at regular intervals about Little Hans soon began to take a prominent place. His parents were both among my closest adherents, and they had agreed that in bringing up their first child they would use no more coercion than might be absolutely necessary for maintaining good behaviour. And, as the child developed into a cheerful, good-natured and lively little boy, the experiment of letting him grow up and express himself without being intimidated went on satisfactorily. I shall now proceed to reproduce his father's records of Little Hans just as I received them; and I shall of
[7] course refrain from any attempt at spoiling the naivety and directness of the nursery by making any conventional emendations [*Entstellungen*][t].

The first reports of Hans date from a period when he was not quite three years old. At that time, by means of various remarks and questions, he was showing a quite peculiarly lively interest in that portion of his body which he used to describe as his 'widdler'.[1] Thus he once asked his mother this question:

Hans: 'Mummy, have you got a widdler too?'

Mother: 'Of course. Why?'

Hans: 'I was only just thinking.'[2]

At the same age he went into a cowshed once and saw a cow being milked. 'Oh, look!' he said, 'there's milk coming out of its widdler!'

1 ['*Wiwimacher*' in the original.]

2 [In 'The Sexual Enlightenment of Children' (1907*c*), *RSE*, **9**, 114, Freud reported her reply as 'Of course. What did you think?']

Even these first observations begin to rouse an expectation that much, if not most, of what Little Hans shows us will turn out to be typical of the sexual development of children in general. I once put forward the view[1] that there was no need to be too much horrified at finding in a woman the idea of sucking at a male organ. This repellent impulse, I argued, had a most innocent origin, since it was derived from sucking at the mother's breast; and in this connection, I went on, a cow's udder plays an apt part as an intermediate image, being in its nature a *mamma* and in its shape and position a penis. Little Hans's discovery confirms the latter part of my contention.

Meanwhile his interest in widdlers was by no means a purely theoretical one; as might have been expected, it also impelled him to *touch* his member. When he was three and a half his mother found him with his hand on his penis. She threatened him in these words: 'If you do that, I shall send for Dr A. to cut off your widdler. And then what'll you widdle with?' [8]

Hans: 'With my bottom.'

He made this reply without having any sense of guilt as yet. But this was the occasion of his acquiring the 'castration complex', the presence of which we are so often obliged to infer in analysing neurotics, though they one and all struggle violently against recognizing it. There is much of importance to be said upon the significance of this element in the life of a child. The 'castration complex' has left marked traces behind it in myths (and not only in Greek myths); in a passage in my *Interpretation of Dreams* [1900*a*],[2] and elsewhere, I have touched upon the part it plays.[3]

1 See my 'Fragment of an Analysis of a Case of Hysteria' (1905*e*) [Section I; *RSE*, **7**, 47].

2 [Within a couple of pages of the end of the book (ibid., **5**, 553). The term 'castration complex' had been used by Freud for the first time in his paper 'On the Sexual Theories of Children' (1908*c*), ibid., **9**, 189. That paper, published very shortly before the present one, anticipates many of its findings and is largely based on the case history of 'Little Hans'.]

3 [*Footnote added* 1923:] – Since this was written, the study of the castration complex has been further developed in contributions to the subject by Lou Andreas-Salomé [1916], A. Stärcke [1921], F. Alexander [1922], and others. It has been urged that every time his mother's breast is withdrawn from a baby he is bound to feel it as castration (that is to say, as the loss of what he regards as an important part of his own body); that, further, he cannot fail to be similarly affected by the regular loss of his faeces; and, finally, that the act of birth itself (consisting as it does in the separation of the child from his mother, with whom he has hitherto been united) is the prototype of all castration. While recognizing all of these roots of the complex, I have nevertheless put forward the view that the term 'castration complex' ought to be confined to those excitations and consequences which are bound up with the loss of the *penis*. Anyone who, in analysing adults, has become convinced of the invariable presence of the castration complex will of course find difficulty in ascribing its origin to a chance threat – of a kind which is not, after all, of such universal occurrence; he will be driven to assume that children construct this danger for themselves out of the slightest hints, which will never be wanting. [Cf. Freud's discussion of 'primal phantasies' in Lecture XXIII of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 325–7, and in Sections V and VIII

[9] At about the same age (three and a half), standing in front of the lions' cage at Schönbrunn,[1] Little Hans called out in a joyful and excited voice: 'I saw the lion's widdler.'

Animals owe a good deal of their importance in myths and fairy tales to the openness with which they display their genitals and their sexual functions to the inquisitive little human child. There can be no doubt about Hans's sexual curiosity; but it also roused the spirit of enquiry in him and enabled him to arrive at genuine abstract knowledge.

When he was at the station once (aged three and three-quarters) he saw some water being let out of an engine. 'Oh, look,' he said, 'the engine's widdling. Where's it got its widdler?'

After a little he added in reflective tones: 'A dog and a horse have widdlers; a table and a chair haven't.' He had thus got hold of an essential characteristic for differentiating between animate and inanimate objects.

Thirst for knowledge seems to be inseparable from sexual curiosity. Hans's curiosity was particularly directed towards his parents.

Hans (aged three and three-quarters): 'Daddy, have you got a widdler too?'

Father: 'Yes, of course.'

Hans: 'But I've never seen it when you were undressing.'

Another time he was looking on intently while his mother undressed before going to bed. 'What are you staring like that for?' she asked.

Hans: 'I was only looking to see if you'd got a widdler too.'

[10] *Mother*: 'Of course. Didn't you know that?'

Hans: 'No. I thought you were so big you'd have a widdler like a horse.'

This expectation of Little Hans's deserves to be borne in mind; it will become important later on.

But the great event of Hans's life was the birth of his little sister Hanna when he was exactly three and a half.[2] His behaviour on that occasion was noted down by his father on the spot: 'At five in the morning', he writes, 'labour began, and Hans's bed was moved into the next room. He woke up there at seven, and, hearing his mother

of his case history of the 'Wolf Man' (1918*b*), ibid., **17**, 43–54 and 85–7. See also below, p. 159 *n.*] This circumstance is also the motive, indeed, that has stimulated the search for those deeper roots of the complex which are universally forthcoming. But this makes it all the more valuable that in the case of Little Hans the threat of castration is reported by his parents themselves, and moreover at a date before there was any question of his phobia. [Cf. Freud (1924*d*), *RSE*, **19**, 168 f.]

2 April 1903 to October 1906.

groaning, asked: "Why's Mummy coughing?" Then, after a pause, "The stork's coming today for certain."

'Naturally he has often been told during the last few days that the stork is going to bring a little girl or a little boy; and he quite rightly connected the unusual sounds of groaning with the stork's arrival.

'Later on he was taken into the kitchen. He saw the doctor's bag in the front hall and asked: "What's that?" "A bag," was the reply. Upon which he declared with conviction: "The stork's coming today." After the baby's delivery the midwife came into the kitchen and Hans heard her ordering some tea to be made. At this he said: "I know! Mummy's to have some tea because she's coughing." He was then called into the bedroom. He did not look at his mother, however, but at the basins and other vessels, filled with blood and water, that were still standing about the room. Pointing to the bloodstained bedpan, he observed in a surprised voice: "But blood doesn't come out of *my* widdler."

'Everything he says shows that he connects what is strange in the situation with the arrival of the stork. He meets everything he sees with a very suspicious and intent look, and *there can be no question that his first doubts about the stork have taken root*.

'Hans is very jealous of the new arrival, and whenever anyone praises [11]
her, says she is a lovely baby, and so on, he at once declares scornfully: "But she's not got any teeth yet."[1] And in fact when he saw her for the first time he was very much surprised that she was unable to speak, and decided that this was because she had no teeth. During the first few days he was naturally put very much in the background. He was suddenly taken ill with a sore throat. In his fever he was heard saying: "But I don't *want* a baby sister!"

'Some six months later he had got over his jealousy, and his brotherly affection for the baby was only equalled by his sense of his own superiority over her.[2]

'A little later Hans was watching his seven-day-old sister being given a bath. "But her widdler's still quite small," he remarked; and then added,

1 This again is a typical mode of behaviour. Another little boy, only two years his sister's senior, used to parry similar remarks with an angry cry of 'Too 'ickle! too 'ickle!'

2 Another child, rather older than Hans, welcomed his younger brother with the words: 'The stork should take it away again.' Compare in this connection my remarks in *The Interpretation of Dreams* [1900*a*, Chapter V, Section D (*β*); *RSE*, **4**, 220 ff.] on dreams of the death of loved relatives.

as though by way of consolation: "When she grows up it'll get bigger all right."[1]

[12] 'At the same age (when he was three and three-quarters) Hans produced his first account of a dream: "Today when I was asleep I thought I was at Gmunden[2] with Mariedl."

'Mariedl was the thirteen-year-old daughter of our landlord and used often to play with him.'

As Hans's father was telling his mother the dream in his presence, he corrected him, saying: 'Not with Mariedl, but quite alone with Mariedl.'

In this connection we learn: 'In the summer of 1906 Hans was at Gmunden, and used to run about all day long with our landlord's children. When we left Gmunden we thought he would be very much upset by having to come away and move back to town. To our surprise this was not so. He seemed glad of the change, and for several weeks he talked [13] very little about Gmunden. It was not until after some weeks had passed that there began to emerge reminiscences – often vividly coloured – of the time he had spent at Gmunden. During the last four weeks or so he has been working these reminiscences up into phantasies. He imagines that he is playing with the other children, with Berta, Olga and Fritzl; he

1 Two other boys were reported to me as having made the same judgement, expressed in identical words and followed by the same anticipation, when they were allowed to satisfy their curiosity and look at their baby sister's body for the first time. One might well feel horrified at such signs of the premature decay of a child's intellect. Why was it that these young enquirers did not report what they really saw – namely, that there was no widdler there? In Little Hans's case, at all events, we can account completely for the faulty perception. We are aware that by a process of careful induction he had arrived at the general proposition that every animate object, in contradistinction to inanimate ones, possesses a widdler. His mother had confirmed him in this conviction by giving him corroborative information in regard to persons inaccessible to his own observation. He was now utterly incapable of surrendering what he had achieved merely on the strength of this single observation made upon his little sister. He therefore made a judgement that in that instance also there was a widdler present, only that it was still very small, but that it would grow till it was as big as a horse's.

We can go a step further in vindicating Little Hans's honour. As a matter of fact, he was behaving no worse than a philosopher of the school of Wundt. In the view of that school, consciousness is the invariable characteristic of what is mental, just as in the view of Little Hans a widdler is the indispensable criterion of what is animate. If now the philosopher comes across mental processes whose existence cannot but be inferred, but about which there is not a trace of consciousness to be detected – for the subject, in fact, knows nothing of them, although it is impossible to avoid inferring their existence – then, instead of saying that they are *un*conscious mental processes, he calls them *semi*-conscious. The widdler's still very small! And in this comparison the advantage is in favour of Little Hans. For, as is so often the case with the sexual researches of children, behind the mistake a piece of genuine knowledge lies concealed. Little girls *do* possess a small widdler, which we call a clitoris, though it does not grow any larger but remains permanently stunted. Compare my short paper on 'The Sexual Theories of Children' (1908*c*) [*RSE*, **9**, 183, and the section on 'The Sexual Researches of Childhood' in the second of Freud's *Three Essays on the Theory of Sexuality* (1905*d*), ibid., **7**, 172 ff.].

2 [A summer resort on one of the Upper Austrian lakes. – Mariedl, Franzl, Fritzl, and similar forms, are the characteristically Austrian affectionate diminutives of Marie, Franz, Fritz, etc.]

talks to them as though they were really with him, and he is capable of amusing himself in this way for hours at a time. Now that he has got a sister and is obviously taken up with the problem of the origin of children, he always calls Berta and Olga "his children"; and once he added: "my children Berta and Olga were brought by the stork too." The dream, occurring now, after six months' absence from Gmunden, is evidently to be read as an expression of a longing to go back there.'

Thus far his father. I will anticipate what is to come by adding that when Hans made this last remark about his children having been brought by the stork, he was contradicting aloud a doubt that was lurking within him.

His father luckily made a note of many things which turned out later on to be of unexpected value. [See p. 29 ff. below.] 'I drew a giraffe for Hans, who has been to Schönbrunn several times lately. He said to me: "Draw its widdler too." "Draw it yourself," I answered; whereupon he added this line to my picture (see Fig. 1).[1] He began by drawing a short stroke, and then added a bit on to it, remarking: "Its widdler's longer."

'Hans and I walked past a horse that was micturating, and he said: [14]
"The horse has got its widdler underneath like me."

'He was watching his three-month-old sister being given a bath, and said in pitying tones: "She *has* got a tiny little widdler."

'He was given a doll to play with and undressed it. He examined it carefully and said: "Her widdler's ever so tiny."'

Fig. 1

1 [In later reprints of this picture there is an unexplained horizontal line. Reference to the original edition in the *Jahrbuch* shows that this horizontal line had the word '*Wiwimacher*' at the end of it. The word and the line had evidently been added by way of explanation, presumably by 'Little Hans's' father. The missing gloss was restored in 1955 by the Editor of the *SE*.]

As we already know, this formula made it possible for him to go on believing in his discovery [of the distinction between animate and inanimate objects] (see p. 8 [and p. 10 *n*. 1 above]).

Every investigator runs the risk of falling into an occasional error. It is some consolation for him if, like Little Hans in the next example, he does not err alone but can quote a common linguistic usage in his support. For Hans saw a monkey in his picture-book one day, and pointing to its upcurled tail, said: 'Daddy, look at its widdler!' [Cf. p. 234 *n*. 1 below.]

His interest in widdlers led him to invent a special game of his own. 'Leading out of the front hall there is a lavatory and also a dark store-room for keeping wood in. For some time past Hans has been going into this wood cupboard and saying: "I'm going to my WC." I once looked in to see what he was doing in the dark store-room. He showed me his parts and said: "I'm widdling." That is to say, he has been "playing" at WC. That it is in the nature of a game is shown not merely by the fact that he was only pretending to widdle, but also by the fact that he does not go into the WC, which would after all be far simpler, but prefers the wood cupboard and calls it "his WC".'

We should be doing Hans an injustice if we were to trace only the auto-erotic features of his sexual life. His father has detailed information
[15] to give us on the subject of his love relationships with other children. From these we can discern the existence of an 'object choice' just as in the case of an adult; and also, it must be confessed, a very striking degree of inconstancy and a disposition to polygamy.

'In the winter (at the age of three and three-quarters) I took Hans to the skating rink and introduced him to my friend N.'s two little daughters, who were about ten years old. Hans sat down beside them, while they, in the consciousness of their mature age, looked down on the little urchin with a good deal of contempt; he gazed at them with admiration, though this proceeding made no great impression on them. In spite of this Hans always spoke of them afterwards as "my little girls". "Where are my little girls? When are my little girls coming?" And for some weeks he kept tormenting me with the question: "When am I going to the rink again to see my little girls?"

'A five-year-old boy cousin came to visit Hans, who had by then reached the age of four. Hans was constantly putting his arms round him, and once, as he was giving him one of these tender embraces, said: "I *am* so fond of you.'"

This is the first trace of homosexuality that we have come across in him, but it will not be the last. Little Hans seems to be a positive paragon of all the vices.

'When Hans was four years old we moved into a new flat. A door led out of the kitchen on to a balcony, from which one could see into a flat on the opposite side of the courtyard. In this flat Hans discovered a little girl of about seven or eight. He would sit on the step leading on to the balcony so as to admire her, and would stop there for hours on end. At four o'clock in the afternoon in particular, when the little girl came home from school, he was not to be kept in the room, and nothing could induce him to abandon his post of observation. Once, when the little girl failed to make her appearance at the window at her usual hour, Hans grew quite restless, and kept pestering the servants with ques- [16]
tions – "When's the little girl coming? Where's the little girl?" and so on. When she did appear at last, he was quite blissful and never took his eyes off the flat opposite. The violence with which this "long-range love"[1] came over him is to be explained by his having no playmates of either sex. Spending a good deal of time with other children clearly forms part of a child's normal development.

'Hans obtained some companionship of this kind when, shortly afterwards (he was by then four and a quarter[2]), we moved to Gmunden for the summer holidays. In our house there his playmates were our landlord's children: Franzl (about twelve years old), Fritzl (eight), Olga (seven) and Berta (five). Besides these there were the neighbour's children, Anna (ten), and two other little girls of nine and seven whose names I have forgotten. Hans's favourite was Fritzl; he often hugged him and made protestations of his love. Once when he was asked: "Which of the girls are you fondest of?" he answered: "Fritzl!" At the same time he treated the girls in a most aggressive, masculine and arrogant way, embracing them and kissing them heartily – a process to which Berta in particular offered no objection. When Berta was coming out of the room one evening he put his arms round her neck and said in the fondest tones: "Berta, you *are* a dear!" This, by the way, did not prevent his kissing the others as well and assuring them of his love. He was fond, too, of the fourteen-year-old Mariedl – another of our landlord's

1 Und die Liebe per Distanz,
Kurzgesagt, missfällt mir ganz.
WILHELM BUSCH
[Long-range love, I must admit, Does not suit my taste a bit.]

2 [This was changed (no doubt inadvertently) to 'four and a half' after the first edition.]

daughters – who used to play with him. One evening as he was being put to bed he said: "I want Mariedl to sleep with me." On being told that would not do, he said: "Then she shall sleep with Mummy or with Daddy."
[17] He was told that would not do either, but that Mariedl must sleep with her own father and mother. Upon which the following dialogue took place:

'*Hans*: "Oh, then I'll just go downstairs and sleep with Mariedl."

'*Mother*: "You really want to go away from Mummy and sleep downstairs?"

'*Hans*: "Oh, I'll come up again in the morning to have breakfast and do number one."

'*Mother*: "Well, if you really want to go away from Daddy and Mummy, then take your coat and knickers and – goodbye!"

'Hans did in fact take his clothes and go towards the staircase, to go and sleep with Mariedl, but, it need hardly be said, he was fetched back.

'(Behind his wish, "I want Mariedl to sleep with us," there of course[1] lay another one: "I want Mariedl" (with whom he liked to be so much) "to become one of our family." But Hans's father and mother were in the habit of taking him into their bed, though only occasionally, and there can be no doubt that lying beside them had aroused erotic feelings in him; so that his wish to sleep with Mariedl had an erotic sense as well. Lying in bed with his father or mother was a source of erotic feelings [*Regungen*][T] in Hans just as it is in every other child.)'

In spite of his accesses of homosexuality, Little Hans bore himself like a true man in the face of his mother's challenge.

'In the next instance, too, Hans said to his mother: "I say, I *should* so like
[18] to sleep with the little girl." This episode has given us a great deal of entertainment, for Hans has really behaved like a grown-up person in love. For the last few days a pretty little girl of about eight has been coming to the restaurant where we have lunch. Of course Hans fell in love with her on the spot. He keeps constantly turning round in his chair to take furtive looks at her; when he has finished eating, he stations himself in her vicinity so as to flirt with her, but if he finds he is being observed, he blushes scarlet. If his glances are returned by the little girl, he at once looks shamefacedly the other way. His behaviour is naturally a great joy

1 ['Of course' was omitted (perhaps inadvertently) after the first edition. – In the editions before 1924 this whole paragraph was enclosed in square brackets. The translators, in 1923, inferred from this fact, and from the references to 'Little Hans's' parents being in the third person, that the paragraph was a comment of Freud's. On his being asked, however, he replied explicitly that the paragraph originated from 'Little Hans's' father. From 1924 onwards the square brackets were replaced with round ones.]

to everyone lunching at the restaurant. Every day as he is taken there he says: "Do you think the little girl will be there today?" And when at last she appears, he goes quite red, just as a grown-up person would in such a case. One day he came to me with a beaming face and whispered in my ear: "Daddy, I know where the little girl lives. I saw her going up the steps in such-and-such a place." Whereas he treats the little girls at home aggressively, in this other affair he appears in the part of a platonic and languishing admirer. Perhaps this has to do with the little girls at home being village children, while the other is a young lady of refinement. As I have already mentioned, he once said he would like to sleep with her.

'Not wanting Hans to be left in the overwrought state to which he had been brought by his passion for the little girl, I managed to make them acquainted, and invited the little girl to come and see him in the garden after he had finished his afternoon sleep. Hans was so much excited at the prospect of the little girl coming, that for the first time he could not get off to sleep in the afternoon, but tossed about restlessly on his bed. When his mother asked, "Why aren't you asleep? Are you thinking about the little girl?" he said "Yes" with a happy look. And when he came home from the restaurant he said to everyone in the house: "I say, my little girl's coming to see me today." The fourteen-year-old Mariedl reported that he had repeatedly kept asking her: "I say, do you think she'll be nice [19]
to me? Do you think she'll kiss me if I kiss her?" and so on.

'But in the afternoon it rained, so that the visit did not come off, and Hans consoled himself with Berta and Olga.'

Other observations, also made at the time of the summer holidays, suggest that all sorts of new developments were going on in the little boy.

'Hans, four and a quarter. This morning Hans was given his usual daily bath by his mother and afterwards dried and powdered. As his mother was powdering round his penis and taking care not to touch it, Hans said: "Why don't you put your finger there?"

'*Mother*: "Because that'd be piggish."

'*Hans*: "What's that? Piggish? Why?"

'*Mother*: "Because it's not proper."

'*Hans* (laughing): "But it's great fun.""[1]

1 Another mother, a neurotic, who was unwilling to believe in infantile masturbation, told me of a similar attempt at seduction on the part of her three-and-a-half-year-old daughter. She had had a pair of drawers made for the little girl, and was trying them on her to see whether they were not too tight for walking. To do this she passed her hand upwards along the inner surface of the child's thigh. Suddenly the little girl shut her legs together on her mother's hand, saying: 'Oh, Mummy, *do* leave your hand there. It feels lovely.'

At about the same period Hans had a dream which was in striking contrast with the boldness he had shown towards his mother. It was the first dream of his that was made unrecognizable by distortion. His father's penetration, however, succeeded in clearing it up.

'Hans, four and a quarter. *Dream*. This morning Hans woke up and said: "I say, last night I thought: *Someone said: 'Who wants to come to me?' Then someone said: 'I do.' Then he had to make him widdle.*"

[20] 'Further questions made it clear that there was no visual content whatever in this dream, and that it was of the purely auditory type. During the last few days Hans has been playing parlour games and "forfeits" with our landlord's children, among whom are his friends Olga (aged seven) and Berta (aged five).[1] (The game of forfeits is played in this way: *A*: "Whose is this forfeit in my hand?" *B*: "Mine." Then it is decided what *B* must do.) The dream was modelled on this game; only what Hans wished was that the person to whom the forfeit belonged should be condemned, not to give the usual kiss or be given the usual box on the ear, but to widdle, or rather to be made to widdle by someone.[2]

'I got him to tell me the dream again. He told it in the same words, except that instead of "then someone said" this time he said "then she said". This "she" is obviously Berta or Olga, one of the girls he had been playing with. Translated, the dream ran as follows: "I was playing forfeits with the little girls. I asked: 'Who wants to come to me?' She (Berta or Olga) replied: 'I do.' Then she had to make me widdle." (That is, she had to assist him in micturating, which is evidently agreeable for Hans.)'

It is clear that being made to widdle – having his knickers unbuttoned and his penis taken out – is a pleasurable process for Hans. On walks it is mostly his father who assists Hans in this way; and this gives the child an opportunity for the fixation of homosexual inclinations upon him.

'Two days ago, as I have already reported, while his mother was washing and powdering his genital region, he asked her: "Why don't you put your finger there?" Yesterday, when I was helping Hans to do number one, he asked me for the first time to take him to the back of the house so

[21] that no-one should see him. He added: "Last year when I widdled, Berta and Olga watched me." This meant, I think, that last year he had enjoyed being watched by the girls, but that this was no longer so. His exhibitionism has now succumbed to repression. The fact that the wish that Berta and Olga should watch him widdling (or make him widdle) is now

1 [In the German editions before 1924 the ages of the two girls were wrongly reversed here. Cf. p. 13 above.]

2 [So in the original. But, as will be seen, the sense requires 'or rather to make someone else widdle'.]

repressed in real life is the explanation of its appearance in the dream, where it was neatly disguised under the game of forfeits. – I have repeatedly observed since then that he does not like to be seen widdling.'

I will add only that this dream obeys the rule I have given in *The Interpretation of Dreams* [1900*a*, Chapter VI, Section F; *RSE*, **5**, 374], to the effect that speeches occurring in dreams are derived from speeches heard or spoken by the dreamer during the preceding days.

Hans's father has noted down one other observation, dating from the period immediately after their return to Vienna: 'Hans (aged four and a half) was again watching his little sister being given her bath, when he began laughing. On being asked why he was laughing, he replied: "I'm laughing at Hanna's widdler." "Why?" "Because her widdler's so lovely."

'Of course, his answer was a disingenuous one. In reality, her widdler had seemed to him *funny*. Moreover, this is the first time he has recognized in this way the distinction between male and female genitals instead of denying it.'

II
CASE HISTORY AND ANALYSIS

[22] 'My dear Professor, I am sending you a little more about Hans – but this time, I am sorry to say, material for a case history. As you will see, during the last few days he has developed a nervous disorder, which has made my wife and me most uneasy, because we have not been able to find any means of dissipating it. I shall venture to call upon you tomorrow, . . . but in the meantime . . . I enclose a written record of the material available.

'No doubt the ground was prepared by sexual overexcitation due to his mother's tenderness; but I am not able to specify the actual exciting cause. He is afraid *a horse will bite him in the street*, and this fear seems somehow to be connected with his having been frightened by a large penis. As you know from a former report, he had noticed at a very early age what large penises horses have, and at that time he inferred that as his mother was so large she must have a widdler like a horse. [Cf. p. 8 above.]

'I cannot see what to make of it. Has he seen an exhibitionist somewhere? Or is the whole thing simply connected with his mother? It is not very pleasant for us that he should begin setting us problems so early. Apart from his being afraid of going into the street and from his being in low spirits in the evening, he is in other respects the same Hans, as bright and cheerful as ever.'

We will not follow Hans's father either in his easily comprehensible anxieties or in his first attempts at finding an explanation; we will begin by examining the material before us. It is not in the least our business to 'understand' a case at once: this is only possible at a later stage, when we
[23] have received enough impressions of it. For the present we will suspend our judgement and give our impartial attention to everything that there is to observe.

The earliest accounts, dating from the first days in January of the present year (1908), run as follows:

'Hans (aged four and three-quarters) woke up one morning in tears. Asked why he was crying, he said to his mother: "When I was asleep I thought you were gone and I had no Mummy to coax with."[1]

'An anxiety dream, therefore.

1 'Hans's expression for "to caress".'

'I had already noticed something similar at Gmunden in the summer. When he was in bed in the evening he was usually in a very sentimental state. Once he made a remark to this effect: "Suppose I was to have no Mummy", or "Suppose you were to go away", or something of the sort; I cannot remember the exact words. Unfortunately, when he got into an elegiac mood of that kind, his mother used always to take him into bed with her.

'On about January 5 he came into his mother's bed in the morning, and said: "Do you know what Aunt M. said? She said: 'He *has* got a dear little thingummy.'"[1] (Aunt M. was stopping with us four weeks ago. Once while she was watching my wife giving the boy a bath she did in fact say these words to her in a low voice. Hans had overheard them and was now trying to put them to his own uses.)

'On January 7 he went to the Stadtpark[2] with his nursemaid as usual. In the street he began to cry and asked to be taken home, saying that he wanted to "coax" with his Mummy. At home he was asked why he had refused to go any farther and had cried, but he would not say. Till the [24]
evening he was cheerful, as usual. But in the evening he grew visibly frightened; he cried and could not be separated from his mother, and wanted to "coax" with her again. Then he grew cheerful again, and slept well.

'On January 8 my wife decided to go out with him herself, so as to see what was wrong with him. They went to Schönbrunn, where he always likes going. Again he began to cry, did not want to start, and was frightened. In the end he did go; but was visibly frightened in the street. On the way back from Schönbrunn he said to his mother, after much internal struggling: "*I was afraid a horse would bite me*." (He had, in fact, become uneasy at Schönbrunn when he saw a horse.) In the evening he seems to have had another attack similar to that of the previous evening, and to have wanted to be "coaxed" with. He was calmed down. He said, crying: "I know I shall have to go for a walk again tomorrow." And later: "The horse'll come into the room."

'On the same day his mother asked: "Do you put your hand to your widdler?" and he answered: "Yes. Every evening, when I'm in bed." The next day, January 9, he was warned, before his afternoon sleep, not to put his hand to his widdler. When he woke up he was asked about it, and said he had put it there for a short while all the same.'

1 Meaning his penis. It is one of the commonest things – psychoanalyses are full of such incidents – for children's genitals to be caressed, not only in word but in deed, by fond relatives, including even parents themselves.

2 [Public gardens near the centre of Vienna.]

Here, then, we have the beginning of Hans's anxiety [*Angst*][T] as well as of his phobia. As we see, there is good reason for keeping the two separate. Moreover, the material seems to be amply sufficient for giving us our bearings; and no moment of time is so favourable for the understanding of a case as its initial stage, such as we have here, though unluckily that stage is as a rule neglected or passed over in silence. The disorder set in with thoughts that were at the same time fearful and tender, and then followed an anxiety dream on the subject of losing his mother and so not being able to coax with her any more. His affection
[25] for his mother must therefore have become enormously intensified. This was the fundamental phenomenon in his condition. In support of this, we may recall his two attempts at seducing his mother, the first of which dated back to the summer [p. 15 above], while the second (a simple commendation of his penis) occurred immediately before the outbreak of his street anxiety. It was this increased affection for his mother which turned suddenly into anxiety – which, as we should say, succumbed to repression. We do not yet know from what quarter the impetus towards repression may have come. Perhaps it was merely the result of the intensity of the child's emotions, which had become greater than he could control; or perhaps other forces which we have not yet recognized were also at work. This we shall learn as we go on. Hans's anxiety, which thus corresponded to a repressed erotic longing, was, like every infantile anxiety, without an object to begin with: it was still anxiety and not yet fear [*Furcht*]. The child cannot tell [at first] what he is afraid of; and when Hans, on the first walk with the nursemaid, would not say what he was afraid of, it was simply that he himself did not yet know. He said all that he knew, which was that in the street he missed his mother, whom he could coax with, and that he did not want to be away from her. In saying this he quite straightforwardly confessed the primary meaning of his dislike of streets.

Then again, there were the states into which he fell on two consecutive evenings before going to sleep, and which were characterized by anxiety mingled with clear traces of tenderness. These states show that at the beginning of his illness there was as yet no phobia whatever present, whether of streets or of walking or even of horses. If there had been, his evening states would be inexplicable; for who bothers at bedtime about streets and walking? On the other hand, it becomes quite clear why he was so fearful in the evening, if we suppose that at bedtime he was overwhelmed by an intensification of his libido – for its object was his
[26] mother, and its aim may perhaps have been to sleep with her. He had

besides learnt from his experience that *at Gmunden* his mother could be prevailed upon, when he got into such moods, to take him into her bed, and he wanted to gain the same ends here in Vienna. Nor must we forget that for part of the time at Gmunden he had been alone with his mother, as his father had not been able to spend the whole of the holidays there, and further, that in the country his affections had been divided among a number of playmates and friends of both sexes, while in Vienna he had none, so that his libido was in a position to return undivided to his mother.

His anxiety, then, corresponded to repressed longing. But it was not the same thing as the longing: the repression must be taken into account too. Longing can be completely transformed into satisfaction if it is presented with the object longed for. Therapy of that kind is no longer effective in dealing with anxiety. The anxiety remains even when the longing can be satisfied. It can no longer be completely retransformed into libido; there is something that keeps the libido back under repression.[1] This was shown to be so in the case of Hans on the occasion of his next walk, when his mother went with him. He was with his mother, and yet he still suffered from anxiety – that is to say, from an unsatisfied longing for her. It is true that the anxiety was less; for he did allow himself to be induced to go for the walk, whereas he had obliged the nursemaid to turn back. Nor is a street quite the right place for 'coaxing', or whatever else this young lover may have wanted. But his anxiety had stood the test; and the next thing for it to do was to find an object. It was on this walk that he first expressed a fear that a horse would bite him. Where did the material for this phobia come from? Probably from the complexes, [27]
as yet unknown to us, which had contributed to the repression and were keeping under repression his libidinal feelings towards his mother. That is an unsolved problem, and we shall now have to follow the development of the case in order to arrive at its solution. Hans's father has already given us certain clues, probably trustworthy ones, such as that Hans had always observed horses with interest on account of their large widdlers, that he had supposed that his mother must have a widdler like a horse, and so on. We might thus be led to think that the horse was merely a substitute for his mother. But if so, what would be the meaning of his being afraid in the evening that a horse would come into the room? A small boy's foolish fears, it will be said. But a neurosis never says

1 To speak quite frankly, this is actually the criterion according to which we decide whether or not such feelings of mingled apprehension and longing are normal: we begin to call them 'pathological anxiety' from the moment at which they can no longer be relieved by the attainment of the object longed for.

foolish things, any more than a dream. When we cannot understand something, we always fall back on abuse. An excellent way of making a task lighter.

There is another point in regard to which we must avoid giving way to this temptation. Hans admitted that every night before going to sleep he amused himself [*zu Lustzwecken*] with playing with his penis. 'Ah!' the family doctor will be inclined to say, 'now we have it. The child masturbated: hence his pathological anxiety.' But gently. That the child was getting pleasure for himself by masturbating does not by any means explain his anxiety; on the contrary, it makes it more problematical than ever. States of anxiety are not produced by masturbation or by getting satisfaction in any shape. Moreover, we may presume that Hans, who was now four and three-quarters, had been indulging in this pleasure every evening for at least a year (see p. 7 above). And we shall find [p. 24 below] that at this moment he was actually engaged in a struggle to break himself of the habit – a state of things which fits in much better with repression [*Verdrängung*][T] and the generation of anxiety.

[28] We must say a word, too, on behalf of Hans's excellent and devoted mother. His father accuses her, not without some show of justice, of being responsible for the outbreak of the child's neurosis, on account of her excessive display of affection for him and her too frequent readiness to take him into her bed. We might as easily blame her for having precipitated the process of repression by her energetic rejection of his advances ('that'd be piggish' [p. 15]). But she had a predestined part to play, and her position was a hard one.

I arranged with Hans's father that he should tell the boy that all this business about horses was a piece of nonsense and nothing more. The truth was, his father was to say, that he was very fond of his mother and wanted to be taken into her bed. The reason he was afraid of horses now was that he had taken so much interest in their widdlers. He himself had noticed that it was not right to be so very much preoccupied with widdlers, even with his own, and he was quite right in thinking this. I further suggested to his father that he should begin giving Hans some enlightenment in the matter of sex knowledge. The child's past behaviour justified us in assuming that his libido was attached to a wish to see his mother's widdler; so I proposed to his father that he should take away this aim from Hans by informing him that his mother and all other female beings (as he could see from Hanna) had no widdler at all. This last piece of enlightenment was to be given him on a suitable occasion when it had been led up to by some question or some chance remark on Hans's part.

The next batch of news about Hans covers the period from March 1 to March 17. The interval of more than a month will be accounted for directly.

'After Hans had been enlightened,[1] there followed a fairly quiet period, during which he could be induced without any particular difficulty to go [29] for his daily walk in the Stadtpark. [See p. 76 below.] His fear of horses became transformed more and more into a compulsion to look at them. He said: "I have to look at horses, and then I'm frightened."

'After an attack of influenza, which kept him in bed for two weeks, his phobia increased again so much that he could not be induced to go out, or at any rate no more than on to the balcony. Every Sunday he went with me to Lainz,[2] because on that day there is not much traffic in the streets, and it is only a short way to the station. On one occasion in Lainz he refused to go for a walk outside the garden because there was a carriage standing in front of it. After another week which he has had to spend indoors because he has had his tonsils cut, the phobia has grown very much worse again. He goes out on to the balcony, it is true, but not for a walk. As soon as he gets to the street door he hurriedly turns round.

'On Sunday, March 1, the following conversation took place on the way to the station. I was once more trying to explain to him that horses do not bite. *He*: "But white horses bite. There's a white horse at Gmunden that bites. If you hold your finger to it it bites." (I was struck by his saying "finger" instead of "hand".) He then told me the following story, which I give here in a connected form: "When Lizzi had to go away, there was a cart with a white horse in front of her house, to take her luggage to the station." (Lizzi, he tells me, was a little girl who lived in a neighbouring house.) "Her father was standing near the horse, and the horse turned its head round (to touch him), and he said to Lizzi: '*Don't put your finger to the white horse or it'll bite you*.'" Upon this I said: "I say, it strikes me that it isn't a horse you mean, but a widdler, that one mustn't put one's hand to."

'*He*: "But a widdler doesn't bite."

'*I*: "Perhaps it does, though." He then went on eagerly to try to prove [30] to me that it really was a white horse.[3]

1 As to the meaning of his anxiety; not yet as to women having no widdlers.

2 A suburb of Vienna [just beyond Schönbrunn] where Hans's grandparents lived.

3 Hans's father had no reason to doubt that it was a real event that the boy was describing. – I may also mention that the sensations of itching in the glans penis, which lead children to touch their genitals, are usually described by them in the phrase '*Es beisst mich*' ['I'm itching', literally 'it bites me'].

'On March 2, as he again showed signs of being afraid, I said to him: "Do you know what? This nonsense of yours" (that is how he speaks of his phobia) "will get better if you go for more walks. It's so bad now because you haven't been able to go out because you were ill."

'*He*: "Oh no, it's so bad because I still put my hand to my widdler every night."'

Doctor and patient, father and son, were therefore at one in ascribing the chief share in the pathogenesis of Hans's present condition to his habit of masturbating.[1] Indications were not wanting, however, of the presence of other significant factors.

'On March 3 we got in a new maid, whom he is particularly pleased with. She lets him ride on her back while she cleans the floor, and so he always calls her "my horse", and holds on to her dress with cries of "Gee-up". On about March 10 he said to this new nursemaid: "If you do such-and-such a thing you'll have to undress altogether, and take off your chemise even." (He meant this as a punishment, but it is easy to recognize the wish behind it.)

'*She*: "And what'd be the harm? I'd just say to myself I haven't got any money to spend on clothes."

'*He*: "Why, it'd be shameful. People'd see your widdler."'

Here we have the same curiosity again, but directed on to a new object, and (appropriately to a period of repression) cloaked under a moralizing purpose.

[31] 'On March 13 in the morning I said to Hans: "You know, if you don't put your hand to your widdler any more, this nonsense of yours'll soon get better."

'*Hans*: "But I don't put my hand to my widdler any more."

'*I*: "But you still want to."

'*Hans*: "Yes, I do. But wanting's not doing, and doing's not wanting." (!!)

'*I*: "Well, but to prevent your wanting to, this evening you're going to have a bag to sleep in."

'After this we went out in front of the house. Hans was still afraid, but his spirits were visibly raised by the prospect of having his struggles made easier for him, and he said: "Oh, if I have a bag to sleep in my nonsense'll have gone tomorrow." And, in fact, he was *much* less afraid of horses, and was fairly calm when vehicles drove past.

1 ['*Onanieangewöhnung*.' The editions previous to 1924 read wrongly '*Onanieabgewöhnung*', 'breaking himself of masturbating'.]

'Hans had promised to go with me to Lainz the next Sunday, March 15. He resisted at first, but finally went with me all the same. He obviously felt all right in the street, as there was not much traffic, and said: "How sensible! God's done away with horses now." On the way I explained to him that his sister has not got a widdler like him. Little girls and women, I said, have no widdlers: Mummy has none, Anna has none, and so on.

'*Hans*: "Have you got a widdler?"

'*I*: "Of course. Why, what do you suppose?"

'*Hans* (after a pause): "But how do little girls widdle, if they have no widdlers?"

'*I*: "They don't have widdlers like yours. Haven't you noticed already, when Hanna was being given her bath?"

'All day long he was in very high spirits, went tobogganing, and so on. It was only towards evening that he fell into low spirits again and seemed to be afraid of horses.

'That evening his attack of nerves and his need for being coaxed with were less pronounced than on previous days. Next day his mother took him with her into town and he was very much frightened in the streets. The day after, he stopped at home and was very cheerful. Next morning [32]
he woke up in a fright at about six o'clock. When he was asked what was the matter he said: "I put my finger to my widdler just a very little. I saw Mummy quite naked in her chemise, and she let me see her widdler. I showed Grete,[1] my Grete, what Mummy was doing, and showed her my widdler. Then I took my hand away from my widdler quick." When I objected that he could only mean "in her chemise" *or* "quite naked", Hans said: "She was in her chemise, but the chemise was so short that I saw her widdler."'

This was none of it a dream, but a masturbatory phantasy, which was, however, equivalent to a dream. What he made his mother do was evidently intended as a piece of self-justification: 'If Mummy shows her widdler, I may too.'

We can gather two things from this phantasy: first, that his mother's reproof had produced a powerful result on him at the time it was made,[2] and secondly, that the enlightenment he had been given to the effect that women have no widdlers was not accepted by him at first. He regretted that it should be so, and in his phantasy he stuck to his former view. He

1 'Grete is one of the little girls at Gmunden about whom Hans is having phantasies just now; he talks and plays with her.'

2 [This presumably refers to her threat (p. 7 above). But see the qualification of this on p. 28 below.]

may also perhaps have had his reasons for refusing to believe his father for the moment.

Weekly Report from Hans's Father: 'My dear Professor, I enclose the continuation of Hans's story – quite an interesting instalment. I shall perhaps take the liberty of calling upon you during your consulting hours on Monday and if possible of bringing Hans with me – assuming that he will come. I said to him today: "Will you come with me on Monday to see the Professor, who can take away your nonsense for you?"

'*He*: "No."

[33] '*I*: "But he's got a very pretty little girl." – Upon which he willingly and gladly consented.

'Sunday, March 22. With a view to extending the Sunday programme, I proposed to Hans that we should go first to Schönbrunn, and only go on from there to Lainz at midday. He had, therefore, to make his way not only from our house to the Hauptzollamt station on the Stadtbahn,[1] but also from the Hietzing station to Schönbrunn, and again from there to the Hietzing steam tramway station. And he managed all this, looking hurriedly away whenever any horses came along, for he was evidently feeling nervous. In looking away he was following a piece of advice given him by his mother.

'At Schönbrunn he showed signs of fear at animals which on other occasions he had looked at without any alarm. Thus he absolutely refused to go into the house in which the *giraffe* is kept, nor would he visit the elephant, which used formerly to amuse him a great deal. He was afraid of all the large animals, whereas he was very much entertained by the small ones. Among the birds, he was also afraid of the pelican this time – which had never happened before – evidently because of its size again.

'I therefore said to him: "Do you know why you're afraid of big animals? Big animals have big widdlers, and you're really afraid of big widdlers."

'*Hans*: "But I've never seen the big animals' widdlers yet."[2]

'*I*: "But you *have* seen a horse's, and a horse is a big animal."

[34] '*Hans*: "Oh, a horse's often. Once at Gmunden when the cart was standing at the door, and once in front of the Head Customs House."

1 [The Head Customs House station on the Vienna local and suburban railway. Hietzing is a suburb which adjoins the palace of Schönbrunn.]

2 This was untrue. See his exclamation in front of the lions' cage on p. 8. It was probably the beginning of amnesia resulting from repression.

'*I*: "When you were small, you most likely went into a stable at Gmunden . . ."

'*Hans* (interrupting): "Yes, I went into the stable every day at Gmunden when the horses had come home."

'*I*: ". . . and you were most likely frightened when you saw the horse's big widdler one time. But there's no need for you to be frightened of it. Big animals have big widdlers, and little animals have little widdlers."

'*Hans*: "And everyone has a widdler. And my widdler will get bigger as I get bigger; it's fixed in, of course."

'Here the talk came to an end. During the next few days it seemed as though his fears had again somewhat increased. He hardly ventured out of the front door, to which he was taken after luncheon.'

Hans's last words of comfort throw a light upon the situation and allow us to make some small corrections in his father's assertions. It is true that he was afraid of big animals because he was obliged to think of their big widdlers; but it cannot really be said that he was afraid of big widdlers themselves. Formerly the idea [*Vorstellung*][T] of them had been decidedly pleasurable to him, and he used to make every effort to get a glimpse of one. Since that time this enjoyment had been spoilt for him, owing to the general reversal of pleasure into unpleasure [*Unlust*][T] which had come over the whole of his sexual researches – in a way which has not yet been explained – and also owing to something which is clearer to us, namely, to certain experiences and reflections which had led to distressing conclusions. We may infer from his self-consolatory words ('my widdler will get bigger as I get bigger') that during his observations he had constantly been making comparisons, and that he had remained extremely dissatisfied with the size of his own widdler. Big animals reminded him of his defect, and were for that reason disagreeable to him. But since the whole train of thought was probably incapable of [35]
becoming clearly conscious, this distressing feeling, too, was transformed into anxiety, so that his present anxiety was erected both upon his former pleasure and his present unpleasure. When once a state of anxiety establishes itself, the anxiety swallows up all other feelings; with the progress of repression, and the more those ideas which are charged with affect and which have been conscious move down into the unconscious, all affects are capable of being changed into anxiety.

Hans's singular remark, 'It's fixed in, of course', makes it possible to guess many things in connection with his consolatory speech which he could not express in words and did not express during the course of the analysis. I shall bridge the gap for a little distance by means of my

experiences in the analyses of grown-up people; but I hope the interpolation will not be considered arbitrary or capricious. 'It's fixed in, of course': if the motives of the thought were solace and defiance, we are reminded of his mother's old threat that she should have his widdler cut off if he went on playing with it. [See p. 7 above.] At the time it was made, when he was three and a half, this threat had no effect. He calmly replied that then he should widdle with his bottom. It would be the most completely typical procedure if the threat of castration were to have a *deferred* *Nachträglichkeit* [*nachträglich*][T] effect, and if he were now, a year and a quarter later, oppressed by the fear of having to lose this precious piece of his ego. In other cases of illness we can observe a similar deferred [*nachträgliche*] operation of commands and threats made in childhood, where the interval covers as many decades or more. I even know cases in which a 'deferred obedience' ['*nachträgliche Gehorsam*'] under the influence of repression has had a principal share in determining the symptoms of the disease.[1]

[36] The piece of enlightenment which Hans had been given a short time before to the effect that women really do not possess a widdler was bound to have had a shattering effect upon his self-confidence and to have aroused his castration complex. For this reason he resisted the information, and for this reason it had no therapeutic results. Could it be that living beings which did not possess widdlers really did exist? If so, it would no longer be so incredible that they could take his own widdler away, and, as it were, make him into a woman![2]

'During the night of [March] 27–28 Hans surprised us by getting out of bed while it was quite dark and coming into our bed. His room is separated from our bedroom by another small room. We asked him why: whether he had been afraid, perhaps. "No," he said; "I'll tell you

1 [Another instance of 'deferred obedience' can be found in the third section of Freud's paper on a 'demonological neurosis' (1923*d*), *RSE*, **19**, 78. A sociological application of the concept appears in the last essay in *Totem and Taboo* (1912–13*a*), ibid., **13**, 132.]

2 I cannot interrupt the discussion so far as to demonstrate the typical character of the unconscious train of thought which I think there is here reason for attributing to Little Hans. The castration complex is the deepest unconscious root of anti-Semitism; for even in the nursery little boys hear that a Jew has something cut off his penis – a piece of his penis, they think – and this gives them a right to despise Jews. And there is no stronger unconscious root for the sense of superiority over women. Weininger (the young philosopher who, highly gifted but sexually deranged, committed suicide after producing his remarkable book, *Geschlecht und Charakter* [1903]), in a chapter that attracted much attention, treated Jews and women with equal hostility and overwhelmed them with the same insults. Being a neurotic, Weininger was completely under the sway of his infantile complexes; and from that standpoint what is common to Jews and women is their relation to the castration complex. [A more elaborate analysis of anti-Semitism can be found in one of Freud's last writings, *Moses and Monotheism* (1939*a*), Essay III, Part I (D); *RSE*, **23**, 82–4.]

tomorrow." He went to sleep in our bed and was then carried back to his own.

'Next day I questioned him closely to discover why he had come in to us during the night; and after some reluctance the following dialogue [37] took place, which I immediately took down in shorthand:

'*He*: "*In the night there was a big giraffe in the room and a crumpled one; and the big one called out because I took the crumpled one away from it. Then it stopped calling out; and then I sat down on top of the crumpled one*."

'*I* (puzzled): "What? A crumpled giraffe? How was that?"

'*He*: "Yes." (He quickly fetched a piece of paper, crumpled it up, and said:) "It was crumpled like that."

'*I*: "And you sat down on top of the crumpled giraffe? How?"

'He again showed me, by sitting down on the ground.

'*I*: "Why did you come into our room?"

'*He*: "I don't know myself."

'*I*: "Were you afraid?"

'*He*: "No. Of course not."

'*I*: "Did you dream about the giraffe?"

'*He*: "No. I didn't dream. I thought it. I thought it all. I'd woken up earlier."

'*I*: "What can it mean: a crumpled giraffe? You know you can't squash a giraffe together like a piece of paper."

'*He*: "Of course I know. I just thought it. Of course there aren't any really and truly.[1] The crumpled one was all lying on the floor, and I took it away – took hold of it with my hands."

'*I*: "What? Can you take hold of a big giraffe like that with your hands?"

'*He*: "I took hold of the crumpled one with my hand."

'*I*: "Where was the big one meanwhile?"

'*He*: "The big one just stood farther off."

'*I*: "What did you do with the crumpled one?"

'*He*: "I held it in my hand for a bit, till the big one had stopped calling [38] out. And when the big one had stopped calling out, I sat down on top of it."

'*I*: "Why did the big one call out?"

'*He*: "Because I'd taken away the little one from it." (He noticed that I was taking everything down, and asked:) "Why are you writing that down?"

1 In his own language Hans was saying quite definitely that it was a phantasy.

'*I*: "Because I shall send it to a Professor, who can take away your 'nonsense' for you."

'*He*: "Oho! So you've written down as well that Mummy took off her chemise, and you'll give that to the Professor too."

'*I*: "Yes. But he won't understand how you can think that a giraffe can be crumpled up."

'*He*: "Just tell him I don't know myself, and then he won't ask. But if he asks what the crumpled giraffe is, then he can write to us, and we can write back, or let's write at once that I don't know myself."

'*I*: "But why did you come in in the night?"

'*He*: "I don't know."

'*I*: "Just tell me quickly what you're thinking of."

'*He* (jokingly): "Of raspberry syrup."
'*I*: "What else?"
'*He*: "A gun for shooting people dead with."[1] } His wishes.

'*I*: "You're sure you didn't dream it?"

'*He*: "Quite sure; no, I'm quite certain of it."

'He proceeded: "Mummy begged me so long to tell her why I came in in the night. But I didn't want to say, because I felt ashamed with Mummy at first."

'*I*: "Why?"

'*He*: "I didn't know."

'My wife had in fact examined [*inquiriert*] him all the morning, till he had told her the giraffe story.'

[39] That same day his father discovered the solution of the giraffe phantasy.

'The big giraffe is myself, or rather my big penis (the long neck), and the crumpled giraffe is my wife, or rather her genital organ. It is therefore the result of the enlightenment he has had [p. 25 above].

'Giraffe: see the expedition to Schönbrunn. [Cf. pp. 11 and 26.] Moreover, he has a picture of a giraffe and an elephant hanging over his bed.

'The whole thing is a reproduction of a scene which has been gone through almost every morning for the last few days. Hans always comes in to us in the early morning, and my wife cannot resist taking him into bed with her for a few minutes. Thereupon I always begin to warn her not to take him into bed with her ("the big one called out because I'd

1 At this point his father in his perplexity was trying to practise the classical technique of psychoanalysis. This did not lead to much; but the result, such as it was, can be given a meaning in the light of later disclosures. [See pp. 76 and 86 *n*. 2 below.]

taken the crumpled one away from it"); and she answers now and then, rather irritated, no doubt, that it's all nonsense, that after all one minute is of no importance, and so on. Then Hans stays with her a little while. ("Then the big giraffe stopped calling out; and then I sat down on top of the crumpled one.")

'Thus the solution of this matrimonial scene transposed into giraffe life is this: he was seized in the night with a longing for his mother, for her caresses, for her genital organ, and came into our bedroom for that reason. The whole thing is a continuation of his fear of horses.'

I have only this to add to his father's penetrating interpretation. The '*sitting* down on top of' was probably Hans's representation of taking *possession*.[1] But the whole thing was a phantasy of defiance connected with his satisfaction at the triumph over his father's resistance. 'Call out as much as you like! But Mummy takes me into bed all the same, and Mummy belongs to me!' It is therefore justifiable, as his father suspected, [40]
to divine behind the phantasy a fear that his mother did not like him, because his widdler was not comparable to his father's.

Next morning his father was able to get his interpretation confirmed.

'On Sunday, March 29, I went with Hans to Lainz. I jokingly took leave of my wife at the door with the words: "Goodbye, big giraffe!" "Why giraffe?" asked Hans. "Mummy's the big giraffe," I replied; to which Hans rejoined: "Oh yes! And Hanna's the crumpled giraffe, isn't she?"

'On the train I explained the giraffe phantasy to him, upon which he said: "Yes, that's right." And when I said to him that I was the big giraffe, and that its long neck had reminded him of a widdler, he said: "Mummy has a neck like a giraffe, too. I saw, when she was washing her white neck."[2]

'On Monday, March 30, in the morning, Hans came to me and said: "I say! I thought two things this morning!" "What was the first?" "I was with you at Schönbrunn where the sheep are; and then we crawled through under the ropes, and then we told the policeman at the end of the garden, and he grabbed hold of us." He had forgotten the second thing.

'I can add the following comment on this. When we wanted to visit the sheep on Sunday, we found that a space in the gardens was shut off

1 [The German word for 'possession' ('*Besitz*') shows its etymological connection with the phrase used by 'Little Hans' ('*sich draufsetzen*') more obviously than the English.]

2 Hans confirmed only the interpretation of the two giraffes as his father and mother, and not the sexual symbolism, according to which the giraffe itself represented the penis. This symbolism was probably correct, but we really cannot ask more of Hans.

by a rope, so that we were unable to get to them. Hans was very much astonished that the space should be shut off only with a rope, which it would be quite easy to slip under. I told him that respectable people didn't crawl under the rope. He said it would be quite easy; whereupon I replied that a policeman might come along and take one off. There is a
[41] lifeguardsman on duty at the entrance of Schönbrunn; and I once told Hans that he arrested naughty children.

'After we returned from our visit to you, which took place the same day, Hans confessed to yet another little bit of craving to do something forbidden: "I say, I thought something this morning again." "What?" "I went with you on the train, and we smashed a window and the policeman took us off with him."'

A most suitable continuation of the giraffe phantasy. He had a suspicion that to take possession of his mother was forbidden; he had come up against the barrier against incest.[1] But he regarded it as forbidden *in itself*. His father was with him each time in the forbidden exploits which he carried out in his imagination, and was locked up with him. His father, he thought, also did that enigmatic forbidden something with his mother which he replaced with an act of violence such as smashing a window-pane or forcing a way into an enclosed space.

That afternoon the father and son visited me during my consulting hours. I already knew the funny little fellow, and with all his self-assurance he was yet so amiable that I had always been glad to see him. I do not know whether he remembered me, but he behaved irreproachably and like a perfectly reasonable member of human society. The consultation was a short one. His father opened it by remarking that, in spite of all the pieces of enlightenment we had given Hans, his fear of horses had not yet diminished. We were also forced to confess that the connections between the horses he was afraid of and the affectionate feelings towards his mother which had been revealed were by no means abundant. Certain details which I now learnt – to the effect that he was particularly bothered by what horses wear in front of their eyes
[42] and by the black round their mouths – were certainly not to be explained from what we knew. But as I saw the two of them sitting in front of me and at the same time heard Hans's description of his anxiety horses, a further piece of the solution shot through my mind, and a piece which I could well understand might escape his father. I asked Hans jokingly whether his horses wore eyeglasses, to which he replied that they did not. I then asked him whether his father wore eyeglasses, to which,

1 [See the third of Freud's *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, 7, 198 f.]

against all the evidence, he once more said no. Finally I asked him whether by 'the black round the mouth' he meant a moustache; and I then disclosed to him that he was afraid of his father precisely because he was so fond of his mother. It must be, I told him, that he thought his father was angry with him on that account; but this was not so, his father was fond of him in spite of it, and he might admit everything to him without any fear. Long before he was in the world, I went on, I had known that a Little Hans would come who would be so fond of his mother that he would be bound to feel afraid of his father because of it; and I had told his father this. 'But why do you think I'm angry with you?' his father interrupted me at this point; 'have I ever scolded you or hit you?' Hans corrected him: 'Oh yes! You have hit me.' 'That's not true. When was it, anyhow?' 'This morning,' answered the little boy; and his father recollected that Hans had quite unexpectedly butted his head into his stomach, so that he had given him as it were a reflex blow with his hand. It was remarkable that he had not brought this detail into connection with the neurosis; but he now recognized it as an expression of the little boy's hostile disposition towards him, and perhaps also as a manifestation of a need for getting punished for it.[1]

'Does the Professor talk to God,' Hans asked his father on the way [43]
home, 'as he can tell all that beforehand?' I should be extraordinarily proud of this recognition out of the mouth of a child if I had not myself provoked it by my joking boastfulness. From the date of this consultation I received almost daily reports of the alterations in the little patient's condition. It was not to be expected that he should be freed from his anxiety at a single blow by the information I gave him; but it became apparent that a possibility had now been offered him of bringing forward his unconscious productions and of unfolding his phobia. From that time forward he carried out a programme which I was able to announce to his father in advance.

'April 2. The *first real improvement* is to be noted. While formerly he could never be induced to go out of the street door for very long, and always ran back into the house with every sign of fright if horses came along, this time he stayed in front of the street door for an hour – even while carts were driving past, which happens fairly often in our street. Every now and then he ran into the house when he saw a cart approaching in the distance, but he turned round at once as though he were

1 Later on the boy repeated his reaction towards his father in a clearer and more complete manner, by first hitting his father on the hand and then affectionately kissing the same hand. – [Cf. in this connection Freud's paper on 'Character-Types' (1916*d*), *RSE*, **14**, 335 f.]

changing his mind. In any case there is only a trace of the anxiety left, and the progress since his enlightenment is unmistakable.

'In the evening he said: "We get as far as the street door now, so we'll go into the Stadtpark too."

'On April 3, in the morning he came into bed with me, whereas for the last few days he had not been coming any more and had even seemed to be proud of not doing so. "And why have you come today?" I asked.

'*Hans*: "When I'm not frightened I shan't come any more."

'*I*: "So you come in to me because you're frightened?"

[44] '*Hans*: "When I'm not with you I'm frightened; when I'm not in bed with you, then I'm frightened. When I'm not frightened any more I shan't come any more."

'*I*: "So you're fond of me and you feel anxious when you're in your bed in the morning? and that's why you come in to me?"

'*Hans*: "Yes. Why did you tell me I'm fond of *Mummy* and that's why I'm frightened, when I'm fond of *you*?"'

Here the little boy was displaying a really unusual degree of clarity. He was bringing to notice the fact that his love for his father was wrestling with his hostility towards him in his capacity of rival with his mother; and he was reproaching his father with not having yet drawn his attention to this interplay of forces, which was bound to end in anxiety. His father did not entirely understand him as yet, for during this conversation he succeeded only in convincing himself of the little boy's hostility towards him, the existence of which I had asserted during our consultation. The following dialogue, which I nevertheless give without alteration, is really of more importance in connection with the progress of the father's enlightenment than with the little patient.

'Unfortunately I did not immediately grasp the meaning of this reproach. Because Hans is fond of his mother he evidently wants to get me out of the way, and he would then be in his father's place. This suppressed hostile wish is turned into anxiety *about* his father, and he comes in to me in the morning to see if I have gone away. Unfortunately at the moment I did not understand this, and said to him:

'"When you're alone, you're just anxious for me and come in to me."

'*Hans*: "When you're away, I'm afraid you're not coming home."

'*I*: "And have I ever threatened you that I shan't come home?"

[45] '*Hans*: "Not you, but Mummy. Mummy's told me she won't come back." (He had probably been naughty, and she had threatened to go away.)

'*I*: "She said that because you were naughty."

'*Hans*: "Yes."

'*I*: "So you're afraid I'm going away because you were naughty; that's why you come in to me."

'When I got up from the table after breakfast Hans said: "Daddy, don't trot away from me!" I was struck by his saying "trot" instead of "run", and replied: "Oho! So you're afraid of the horse trotting away from you." Upon which he laughed.'

We know that this portion of Hans's anxiety had two constituents: there was fear *of* his father and fear *for* his father. The former was derived from his hostility towards his father, and the latter from the conflict between his affection, which was exaggerated at this point by way of compensation, and his hostility.

His father proceeds: 'This is no doubt the beginning of an important phase. His motive for at the most just venturing outside the house but not going away from it, and for turning round at the first attack of anxiety when he is halfway, is his fear of not finding his parents at home because they have gone away. He sticks to the house from love of his mother, and he is afraid of my going away because of the hostile wishes that he nourishes against me – for then *he* would be the father.

'In the summer I used to be constantly leaving Gmunden for Vienna on business, and he was then the father. You will remember that his fear of horses is connected with the episode at Gmunden when a horse was to take Lizzi's luggage to the station [p. 23 above]. The repressed wish that I should drive to the station, for then he would be alone with his mother (the wish that "the horse should drive off"), is turned into fear of the horse's driving off; and in fact nothing throws him into greater alarm than when a cart drives off from the courtyard of the Head [46]
Customs House (which is just opposite our flat) and the horses start moving.

'This new phase (hostile sentiments towards his father) could only come out after he knew that I was not angry because he was so fond of his mother.

'In the afternoon I went out in front of the street door with him again; he again went out in front of the house, and stayed there even when carts went past. In the case of a few carts only he was afraid, and ran into the entrance hall. He also said to me in explanation: "Not all white horses bite." That is to say: owing to the analysis some white horses have already been recognized as "Daddy", and they no longer bite; but there are others still left over which *do* bite.

'The position of our street door is as follows: Opposite it is the warehouse of the Office for the Taxation of Foodstuffs, with a loading dock at which carts are driving up all day long to fetch away boxes, packing cases, etc. This courtyard is cut off from the street by railings; and the entrance gates to the courtyard are opposite our house (Fig. 2). I have noticed for some days that Hans is specially frightened when carts drive into or out of the yard, a process which involves their taking a corner. I asked at the time why he was so much afraid, and he replied: "*I'm afraid the horses will fall down when the cart turns*" (*a*). He is equally frightened when carts standing at the loading dock start moving in order to
[47] drive off (*b*). Further (*c*), he is more frightened of large dray-horses than of small horses, and of rough farm-horses than of smart horses (such as those in a carriage with a pair [of horses]). He is also more frightened when a vehicle drives past quickly (*d*) than when the horses trot up slowly. These differentiations have, of course, only come to light clearly during the last few days.'

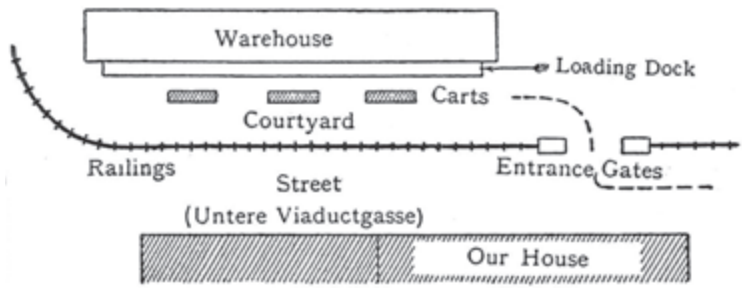

Fig. 2

I should be inclined to say that, in consequence of the analysis, not only the patient but his phobia too had plucked up courage and was venturing to show itself. [Cf. p. 95 below.]

'On April 5 Hans came into our bedroom again, and was sent back to his own bed. I said to him: "As long as you come into our room in the mornings, your fear of horses won't get better." He was defiant, however, and replied: "I shall come in all the same, even if I *am* afraid." So he will not let himself be forbidden to visit his mother.

'After breakfast we were to go downstairs. Hans was delighted, and planned that, instead of stopping in front of the street door as usual, he should go across the street into the yard, where he had often enough seen street boys playing. I told him I should be pleased if he were to go

across, and took the opportunity of asking him why he is so much afraid when the loaded carts at the loading dock start moving (*b*).

'*Hans*: "I'm afraid of standing by the cart and the cart driving off quick, and of my standing on it and wanting to get on to the board (the loading dock), and my driving off in the cart."

'*I*: "And if the cart stands still? Aren't you afraid then? Why not?"

'*Hans*: "If the cart stands still, then I can get on to the cart quick and get on to the board." [Fig. 3.]

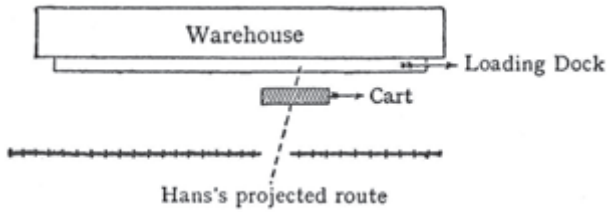

Fig. 3

'(So Hans is planning to climb over a cart on to the loading dock, and is afraid of the cart driving away while he is on it.)

'*I*: "Perhaps you're afraid you won't come home any more if you drive away in the cart?"

'*Hans*: "Oh no! I can always come back to Mummy, in the cart or in a [48]
cab. I can tell him the number of the house too."

'*I*: "Then why *are* you afraid?"

'*Hans*: "I don't know. But the Professor'll know. D'you think he'll know?"

'*I*: "And why do you want to get over on to the board?"

'*Hans*: "Because I've never been up there, and I should so much like to be there; and d'you know why I should like to go there? Because I should like to load and unload the boxes, and I should like to climb about on the boxes there. I should so like to climb about there. D'you know who I learnt the climbing about from? Some boys climbed on the boxes, and I saw them, and I want to do it too."

'His wish was not fulfilled. For when Hans ventured once more in front of the street door, the few steps across the street and into the courtyard awoke too great resistances in him, because carts were constantly driving into the yard.'

The Professor only knows that the game which Hans intended to play with the loaded carts must have stood in the relation of a symbolic substitute to some other wish as to which he had so far uttered no word. But,

if it did not seem too daring, this wish might already, even at this stage, be constructed.

'In the afternoon we again went out in front of the street door, and when I returned I asked Hans:

'"Which horses are you actually most afraid of?"

'*Hans*: "All of them."

[49] '*I*: "That's not true."

'*Hans*: "I'm most afraid of horses with a thing on their mouths."

'*I*: "What do you mean? The piece of iron they have in their mouths?"

'*Hans*: "No. They have something black on their mouths." (He covered his mouth with his hand.)

'*I*: "What? A moustache, perhaps?"

'*Hans* (laughing): "Oh no!"

'*I*: "Have they all got it?"

'*Hans*: "No, only a few of them."

'*I*: "What is it that they've got on their mouths?"

'*Hans*: "A black thing." (I think in reality it must be the thick piece of harness that dray-horses wear over their noses.) [Fig. 4.]

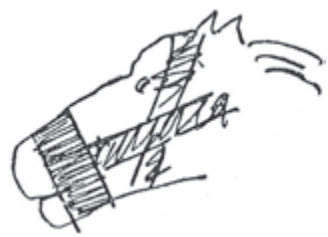

Fig. 4

'"And I'm most afraid of furniture vans, too."

'*I*: "Why?"

'*Hans*: "I think when furniture-horses are dragging a heavy van they'll fall down."

'*I*: "So you're not afraid with a small cart?"

'*Hans*: "No. I'm not afraid with a small cart or with a post-office van. I'm most afraid too when a bus comes along."

'*I*: "Why? Because it's so big?"

'*Hans*: "No. Because once a horse in a bus fell down."

'*I*: "When?"

'*Hans*: "Once when I went out with Mummy in spite of my 'nonsense', when I bought the waistcoat." (This was subsequently confirmed by his mother.)

'*I*: "What did you think when the horse fell down?"

'*Hans*: "Now it'll always be like this. All horses in buses'll fall down."

'*I*: "In all buses?"

'*Hans*: "Yes. And in furniture vans too. Not often in furniture vans." [50]

'*I*: "You had your nonsense already at that time?"

'*Hans*: "No. I only got it then. When the horse in the bus[1] fell down, it gave me such a fright, really! That was when I got the nonsense."

'*I*: "But the nonsense was that you thought a horse would bite you. And now you say you were afraid a horse would fall down."

'*Hans*: "Fall down and bite."[2]

'*I*: "Why did it give you such a fright?"

'*Hans*: "Because the horse went like this with its feet." (He lay down on the ground and showed me how it kicked about.) "It gave me a fright *because it made a row with its feet*."

'*I*: "Where did you go with Mummy that day?"

'*Hans*: "First to the skating rink, then to a café, then to buy a waistcoat, then to the pastry-cook's with Mummy, and then home in the evening; we went back through the Stadtpark." (All of this was confirmed by my wife, as well as the fact that the anxiety broke out immediately afterwards.)

'*I*: "Was the horse dead when it fell down?"

'*Hans*: "Yes!"

'*I*: "How do you know that?"

'*Hans*: "Because I saw it." (He laughed.) "No, it wasn't a bit dead."

'*I*: "Perhaps you thought it was dead?"

'*Hans*: "No. Certainly not. I only said it as a joke." (His expression at the moment, however, had been serious.)

'As he was tired, I let him run off. He only told me besides this that he [51] had first been afraid of bus-horses, then of all others, and only in the end of furniture-van horses.

'On the way back from Lainz there were a few more questions:

'*I*: "When the bus-horse fell down, what colour was it? White, red, brown, grey?"

'*Hans*: "Black. Both horses were black."

'*I*: "Was it big or little?"

'*Hans*: "Big."

'*I*: "Fat or thin?"

1 [In the editions before 1924 this was wrongly given as 'furniture van'.]

2 Hans was right, however improbable this collocation may sound. The train of thought, as we shall see, was that the horse (his father) would bite him because of his wish that it (his father) should fall down.

'*Hans*: "Fat. Very big and fat."

'*I*: "When the horse fell down, did you think of your daddy?"

'*Hans*: "Perhaps. Yes. It's possible.'"

His father's investigations may have been without success at some points; but it does no harm to make acquaintance at close quarters with a phobia of this sort – which we may feel inclined to name after its new objects. [Cf. p. 95 f. below.] For in this way we get to see how diffuse it really is. It extends on to horses and on to carts, on to the fact that horses fall down and that they bite, on to horses of a particular character, on to carts that are heavily loaded. I will reveal at once that all these characteristics were derived from the circumstance that the anxiety originally had no reference at all to horses but was transposed on to them secondarily and had now become fixed upon those elements of the horse complex which showed themselves well adapted for certain transferences [*Übertragungen*].[1] We must specially acknowledge one most important result of the boy's examination [*Inquisition*][t] by his father. We have learnt the immediate precipitating cause after which the phobia broke
[52] out. This was when the boy saw a big heavy horse fall down; and one at least of the interpretations [*Deutungen*][T] of this impression seems to be that emphasized by his father, namely, that Hans at that moment perceived a wish that his father might fall down in the same way – and be dead. His serious expression as he was telling the story no doubt referred to this unconscious meaning. May there not have been yet another meaning concealed behind all this? And what can have been the significance of the making a row with its legs?

'For some time Hans has been playing horses in the room; he trots about, falls down, kicks about with his feet, and neighs. Once he tied a small bag on like a nosebag. He has repeatedly run up to me and bitten me.'

In this way he was accepting the last interpretations more decidedly than he could in words, but naturally with a change of parts, for the game was played in obedience to a wishful phantasy. Thus *he* was the horse, and bit his father, and in this way was identifying himself with his father.

'I have noticed for the last two days that Hans has been defying me in the most decided manner, not impudently, but in the highest spirits. Is it because he is no longer afraid of me – the horse?

1 [Here 'transference' has a wider meaning than the one more usual in Freud's later writings. It is used in the present sense in *The Interpretation of Dreams* (1900*a*), Chapter VII, Section C; *RSE*, **5**, 503; cf. ibid., **24**, 89.]

'April 6. Went out with Hans in front of the house in the afternoon. At every horse that passed I asked him if he saw the "black on its mouth"; he said "no" every time. I asked him what the black really looked like; he said it was black iron. My first idea, that he meant the thick leather straps that are part of the harness of dray-horses, is therefore unconfirmed. I asked him if the "black" reminded him of a moustache, and he said: "Only by its colour." So I do not yet know what it really is.

'The fear has diminished; this time he ventured as far as the next-door house, but turned round quickly when he heard the sound of horses' hooves in the distance. When a cart drew up at our door and came to a [53]
stop, he became frightened and ran into the house, because the horse began pawing with its foot. I asked him why he was afraid, and whether perhaps he was nervous because the horse had done like this (and I stamped with my foot). He said: "Don't make such a row with your feet!" Compare his remark about the fallen bus-horse.

'He was particularly terrified by a furniture van passing by. At that he ran right inside the house. "Doesn't a furniture van like that," I asked him unconcernedly, "really look like a bus?" He said nothing. I repeated the question, and he then said: "Why, of course! Otherwise I shouldn't be so afraid of a furniture van."

'April 7. I asked again today what the "black on the horses' mouths" looked like. Hans said: "Like a muzzle." The curious thing is that for the last three days not a single horse on which he could point out this "muzzle" has passed. I myself have seen no such horse on any of my walks, although Hans asseverates that such horses do exist. I suspect that some sort of horses' bridle – the thick piece of harness round their mouths, perhaps – really reminded him of a moustache, and that after I alluded to this this fear disappeared as well.

'Hans's improvement is constant. The radius of his circle of activity with the street door as its centre grows ever wider. He has even accomplished the feat, which has hitherto been impossible for him, of running across to the pavement opposite. All the fear that remains is connected with the bus scene, the meaning of which is not yet clear to me.

'April 9. This morning Hans came in to me while I was washing and bare to the waist.

'*Hans*: "Daddy, you *are* lovely! You're so white."

'*I*: "Yes. Like a white horse."

[54] '*Hans*: "The only black thing's your moustache." (Continuing) "Or perhaps it's a black muzzle?"

'I told him then that I had been to see the Professor the evening before, and said: "There's one thing he wants to know." "I *am* curious," remarked Hans.

'I told him I knew on what occasions it was that he made a row with his feet. "Oh, yes!" he interrupted me, "when I'm cross, or when I have to do 'lumf' and would rather play." (He has a habit, it is true, of making a row with his feet, i.e. of stamping, when he is angry. – "Doing lumf" means doing number two. When Hans was small he said one day when he got off the chamber: "Look at the lumf [German: '*Lumpf*']." He meant "stocking" [German: "*Strumpf*"], because of its shape and colour. This designation has been preserved to this day. – In very early days, when he had to be put on the chamber, and refused to leave off playing, he used to stamp his feet in a rage, and kick about, and sometimes throw himself on the ground.)

'"And you kick about with your feet as well, when you have to widdle and don't want to go, because you'd rather go on playing."

'*He*: "Oh, I must widdle." And he went out of the room – by way of confirmation, no doubt.'

In the course of his visit his father had asked me what Hans could have been reminded of by the fallen horse kicking about with its feet. I had suggested that that may have been his own reaction when he retained his urine. Hans now confirmed this by means of the re-emergence during the conversation of a desire to micturate; and he added some other meanings of the making a row with the feet.

'We then went out in front of the street door. When a coal cart came along, he said to me: "Daddy, I'm very much afraid of coal carts, too."

'*I*: "Perhaps that's because they're as big as buses, too."

[55] '*Hans*: "Yes; and because they're so heavily loaded, and the horses have so much to drag and might easily fall down. If a cart's empty, I'm not afraid." It is a fact, as I have already remarked, that only heavy vehicles throw him into a state of anxiety.'

Nevertheless, the situation was decidedly obscure. The analysis was making little progress; and I am afraid the reader will soon begin to find this description of it tedious. Every analysis, however, has dark periods of this kind. But Hans was now on the point of leading us into an unexpected region.

'I came home and was speaking to my wife, who had made various purchases which she was showing me. Among them was a pair of yellow ladies' drawers. Hans exclaimed "Ugh!" two or three times, threw himself on the ground, and spat. My wife said he had done this two or three times already when he had seen the drawers.

'"Why do you say 'Ugh'?" I asked.

'*Hans*: "Because of the drawers."

'*I*: "Why? Because of their colour? Because they're yellow, and remind you of lumf or widdle?"

'*Hans*: "Lumf isn't yellow. It's white or black." – Immediately afterwards: "I say, is it easy to do lumf if you eat cheese?" (I had once told him so, when he asked me why I ate cheese.)

'*I*: "Yes."

'*Hans*: "That's why you go straight off every morning and do lumf? I should so much like to eat cheese with my bread and butter."

'He had already asked me yesterday as he was jumping about in the street: "I say, it's true, isn't it, if you jump about a lot you can do lumf easily?" – There has been trouble with his stools from the very first; and aperients and enemas have frequently been necessary. At one time his habitual constipation was so great that my wife called in Dr L. He was [56]
of the opinion that Hans was overfed, which was in fact the case, and recommended a more moderate diet – and the condition was at once brought to an end. Recently the constipation has again made its appearance more frequently.

'After luncheon I said to him: "We'll write to the Professor again," and he dictated to me: "When I saw the yellow drawers I said 'Ugh! that makes me spit!' and threw myself down and shut my eyes and didn't look."

'*I*: "Why?"

'*Hans*: "Because I saw the yellow drawers; and I did the same sort of thing with the black drawers too.[1] The black ones are the same sort of drawers, only they were black." (Interrupting himself) "I say, I *am* glad. I'm always so glad when I can write to the Professor."

'*I*: "Why did you say 'Ugh'? Were you disgusted?"

'*Hans*: "Yes, because I saw that. I thought I should have to do lumf."

'*I*: "Why?"

'*Hans*: "I don't know."

'*I*: "When did you see the black drawers?"

1 'For the last few weeks my wife has possessed a pair of black bloomers for wearing on cycling tours.'

'*Hans*: "Once, when Anna (our maid) had been here a long time – with Mummy – she brought them home just after she'd bought them." (This statement was confirmed by my wife.)

'*I*: "Were you disgusted then, too?"

'*Hans*: "Yes."

'*I*: "Have you seen Mummy in drawers like that?"

'*Hans*: "No."

'*I*: "When she was dressing?"

'*Hans*: "When she bought the yellow ones I'd seen them once before already." (This is contradicted. He saw the yellow ones for the first time
[57] when his mother bought them.) "She's got the black ones on today too" (correct), "because I saw her take them off in the morning."

'*I*: "What? She took off the black drawers in the morning?"

'*Hans*: "In the morning when she went out she took off the black drawers, and when she came back she put the black ones on again."

'I asked my wife about this, as it seemed to me absurd. She said it was entirely untrue. Of course she had not changed her drawers when she went out.

'I at once asked Hans about it: "You told me that Mummy had put on some black drawers, and that when she went out she took them off, and that when she came back she put them on again. But Mummy says it's not true."

'*Hans*: "I think perhaps I may have forgotten she didn't take them off." (Impatiently) "Oh, do let me alone."'

I have a few comments to make at this point on the business of the drawers. It was obviously mere hypocrisy on Hans's part to pretend to be so glad of the opportunity of giving an account of the affair. In the end he threw the mask aside and was rude to his father. It was a question of things which had once afforded him *a great deal of pleasure*, but of which, now that repression had set in, he was very much ashamed, and at which he professed to be disgusted. He told some downright lies so as to disguise the circumstances in which he had seen his mother change her drawers. In reality, the putting on and taking off of her drawers belonged to the 'lumf' context. His father was perfectly aware of what it was all about and of what Hans was trying to conceal.

'I asked my wife whether Hans was often with her when she went to the WC. "Yes," she said, "often. He goes on pestering me till I let him. Children are all like that."'

Nevertheless, it is worth bearing carefully in mind the desire, which Hans had already repressed, for seeing his mother doing lumf.

'We went out in front of the house. He was in very good spirits and was [58]
prancing about all the time like a horse. So I said: "Now, who is it that's the bus-horse? Me, you or Mummy?"

'*Hans* (promptly): "I am; I'm a young horse."

'During the period when his anxiety was at its height, and he was frightened at seeing horses frisking, he asked me why they did it; and to reassure him I said: "Those are young horses, you see, and they frisk about like little boys. You frisk about too, and you're a little boy." Since then, whenever he has seen horses frisking, he has said: "That's right; those are young horses!"

'As we were going upstairs I asked him almost without thinking: "Used you to play at horses with the children at Gmunden?"

'*He*: "Yes." (Thoughtfully) "I think that was how I got the nonsense."

'*I*: "Who was the horse?"

'*He*: "I was; and Berta was the coachman."

'*I*: "Did you fall down by any chance, when you were a horse?"

'*Hans*: "No. When Berta said 'Gee-up', I ran ever so quick; I just raced along."[1]

'*I*: "You never played at buses?"

'*Hans*: "No. At ordinary carts, and horses without carts. When a horse has a cart, it can go without a cart just as well, and the cart can stay at home."

'*I*: "Used you often to play at horses?"

'*Hans*: "Very often. Fritzl[2] was the horse once, too, and Franzl the coachman; and Fritzl ran ever so fast and all at once he hit his foot on a stone and bled."

'*I*: "Perhaps he fell down?"

'*Hans*: "No. He put his foot in some water and then wrapped it up."[3] [59]

'*I*: "Were you often the horse?"

'*Hans*: "Oh, yes."

'*I*: "And that was how you got the nonsense?"

'*Hans*: "Because they kept on saying ''cos of the horse,' ''cos of the horse'" (he put a stress on the ''cos'); "so perhaps I got the nonsense because they talked like that; ''cos of the horse.'"'[4]

1 'Hans had a set of toy harness with bells.'

2 Another of the landlord's children, as we already know [see p. 13 above].

3 See below [p. 63]. His father was quite right in suspecting that Fritzl fell down.

4 ['*Wegen dem Pferd.*'] I may explain that Hans was not maintaining that he had got the nonsense *at that time* but *in that connection*. Indeed, it must have been so, for theoretical considerations require that what is today the object of a phobia must at one time in the past have been the source of a high degree of pleasure. I may at the same time complete what the child was unable to express,

For a while Hans's father pursued his enquiry fruitlessly along other paths.

'*I*: "Did they tell you anything about horses?"

'*Hans*: "Yes."

'*I*: "What?"

'*Hans*: "I've forgotten."

'*I*: "Perhaps they told you about their widdlers?"

'*Hans*: "Oh, no."

'*I*: "Were you frightened of horses already then?"

'*Hans*: "Oh, no. I wasn't frightened at all."

'*I*: "Perhaps Berta told you that horses —"

[60] '*Hans* (interrupting): "— widdle? No."

'On April 10[1] I took up our conversation of the day before, and tried to discover what his "'cos of the horse" meant. Hans could not remember; he knew only that some children had stood outside the front door one morning and had said, "'cos of the horse, 'cos of the horse!" He had been there himself. When I pressed him more closely, he declared that they had not said "'cos of the horse" at all, but that he had remembered wrong.

'*I*: "But you and the others were often in the stables. You must surely have talked about horses there." – "We didn't." – "What did you talk about?" – "Nothing." – "Such a lot of children, and nothing to talk about?" – "We did talk about something, but not about horses." – "Well, what was it?" – "I don't remember any more."

'I allowed the matter to drop, as the resistances were evidently too great,[2] and went on to the following question: "Did you like playing with Berta?"

'*He*: "Yes, very much; but not with Olga. D'you know what Olga did? I was given a paper ball once by Grete up there at Gmunden, and Olga tore it all to pieces. Berta would never have torn my ball. I liked playing with Berta very much."

'*I*: "Did you see what Berta's widdler looked like?"

and add that the little word '*wegen*' ['because of', ''cos of'] was the means of enabling the phobia to extend from horses on to '*Wagen*' ['vehicles'] or, as Hans was accustomed to pronounce the word and hear it pronounced, '*Wägen*' [pronounced exactly like '*wegen*']. It must never be forgotten how much more concretely children treat words than grown-up people do, and consequently how much more significant for them are similarities of sound in words. [This point was remarked upon by Freud in *The Interpretation of Dreams* (1900*a*), Chapter VI; *RSE*, **4**, 270, as well as in Chapter IV of his book on *Jokes* (1905*c*), ibid., **8**, 105.]

1 ['Little Hans's' birthday.]

2 In point of fact, there was nothing more to be got out of it than Hans's verbal association, and this had escaped his father. Here is a good instance of conditions under which an analyst's efforts are wasted.

'*He*: "No, but I saw the horses'; because I was always in the stables, and so I saw the horses' widdlers."

'*I*: "And so you were curious and wanted to know what Berta's and Mummy's widdlers looked like?"

'*He*: "Yes."

'I reminded him of how he had once complained to me that the little [61]
girls always wanted to look on while he was widdling [p. 16 above].

'*He*: "Berta always looked on at me too" (he spoke with great satisfaction and not at all resentfully); "often she did. I used to widdle in the little garden where the radishes were, and she stood outside the front door and looked on at me."

'*I*: "And when she widdled, did you look on?"

'*He*: "She used to go to the WC."

'*I*: "And you were curious?"

'*He*: "I was inside the WC when she was in it."

'(This was a fact. The servants told us about it once, and I recollect that we forbade Hans to do it.)

'*I*: "Did you tell her you wanted to go in?"

'*He*: "I went in alone and because Berta let me. There's nothing shameful in that."

'*I*: "And you'd have liked to see her widdler?"

'*He*: "Yes, but I didn't see it."

'I then reminded him of the dream about playing forfeits that he had had at Gmunden [p. 16], and said: "When you were at Gmunden did you want Berta to make you widdle?"

'*He*: "I never said so to her."

'*I*: "Why didn't you ever say so to her?"

'*He*: "Because I didn't think of it." (Interrupting himself) "If I write everything to the Professor, my nonsense'll soon be over, won't it?"

'*I*: "Why did you want Berta to make you widdle?"

'*He*: "I don't know. Because she looked on at me."

'*I*: "Did you think to yourself she should put her hand to your widdler?"

'*He*: "Yes." (Changing the subject) "It was such fun at Gmunden. In the little garden where the radishes were there was a little sand-heap; I used to play there with my spade."

'(This was the garden where he used always to widdle.)

'*I*: "Did you put your hand to your widdler at Gmunden, when you were in bed?"

[62] '*He*: "No. Not then; I slept so well at Gmunden that I never thought of it at all. The only times I did it was at —— Street[1] and now."

'*I*: "But Berta never put her hand to your widdler?"

'*He*: "She never did, no; because I never told her to."

'*I*: "Well, and when was it you wanted her to?"

'*He*: "Oh, at Gmunden once."

'*I*: "Only once?"

'*He*: "Well, now and then."

'*I*: "She used always to look on at you when you widdled; perhaps she was curious to know how you did it?"

'*He*: "Perhaps she was curious to know what my widdler looked like."

'*I*: "But you were curious too. Only about Berta?"

'*He*: "About Berta, and about Olga."

'*I*: "About who else?"

'*He*: "About no-one else."

'*I*: "You know that's not true. About Mummy too."

'*He*: "Oh, yes, about Mummy."

'*I*: "But now you're not curious any more. You know what Hanna's widdler looks like, don't you?"

'*He*: "It'll grow, though, won't it?"[2]

'*I*: "Yes, of course. But when it's grown it won't look like yours."

'*He*: "I know that. It'll be the same" (*sc*. as it now is) "only bigger."

'*I*: "When we were at Gmunden, were you curious when your Mummy undressed?"

'*He*: "Yes. And then when Hanna was in her bath I saw her widdler."

'*I*: "And Mummy's too?"

'*He*: "No."

'*I*: "You were disgusted when you saw Mummy's drawers?"

[63] '*He*: "Only when I saw the black ones – when she bought them – then I spat. But I don't spit when she puts her drawers on or takes them off. *I spit because the black drawers are black like a lumf and the yellow ones like a widdle, and then I think I've got to widdle*. When Mummy has her drawers on I don't see them; she's got her clothes on over them."

'*I*: "And when she takes off her clothes?"

'*He*: "I don't spit then either. But when her drawers are new they look like a lumf. When they're old, the colour goes away and they get dirty. When you buy them they're quite clean, but at home they've been made

1 The flat they were in before the move [p. 13 above].

2 Hans wants to be assured that his own widdler will grow.

dirty. When they're bought they're new, and when they're not bought they're old."

'*I*: "Then you aren't disgusted by old ones?"

'*He*: "When they're old they're much blacker than a lumf, aren't they? They're just a bit blacker."[1]

'*I*: "Have you often been into the WC with Mummy?"

'*He*: "Very often."

'*I*: "And were you disgusted?"

'*He*: "Yes . . . No."

'*I*: "You like being there when Mummy widdles or does lumf?"

'*He*: "Yes, very much."

'*I*: "Why do you like it so much?"

'*He*: "I don't know."

'*I*: "Because you think you'll see her widdler."

'*He*: "Yes, I do think that."

'*I*: "But why won't you ever go into the WC at Lainz?"

'(At Lainz he always begs me not to take him into the WC; he was frightened once by the noise of the flush.)

'*He*: "Perhaps it's because it makes a row when you pull the plug." [64]

'*I*: "And then you're afraid."

'*He*: "Yes."

'*I*: "And what about our WC here?"

'*He*: "Here I'm not. At Lainz it gives me a fright when you pull the plug. And when I'm inside and the water rushes down, then it gives me a fright too."

'And, "just to show me that he wasn't frightened in our flat," he made me go into the WC and set the flush in motion. He then explained to me:

'"First there's a loud row, and then a loose one." (This is when the water comes down.) "When there's a loud row I'd rather stay inside, and when there's a soft one I'd rather go out."

'*I*: "Because you're afraid?"

'*He*: "Because if there's a loud row I always so much like to see it" – (correcting himself) "to hear it; so I'd rather stay inside and hear it properly."

'*I*: "What does a loud row remind you of?"

1 Our young man was here wrestling with a subject of which he was not equal to giving a clear exposition; so that there is some difficulty in understanding him. He may perhaps have meant that the drawers only recalled his feelings of disgust when he saw them on their own account; as soon as his mother had them on, he ceased to connect them with lumf or widdle, and they then interested him in a different way.

'*He*: "That I've got to do lumf in the WC." (The same thing, that is, that the black drawers reminded him of.)

'*I*: "Why?"

'*He*: "I don't know. A loud row sounds as though you were doing lumf. A big row reminds me of lumf, and a little one of widdle." (Cf. the black and the yellow drawers.)

'*I*: "I say, wasn't the bus-horse the same colour as a lumf?" (According to his account it had been black [p. 39 above].)

'*He* (very much struck): "Yes."'

At this point I must put in a few words. Hans's father was asking too many questions, and was pressing the enquiry along his own lines instead of allowing the little boy to express his thoughts. For this reason the analysis began to be obscure and uncertain. Hans went his own way and
[65] would produce nothing if attempts were made to draw him off it. For the moment his interest was evidently centred upon lumf and widdle, but we cannot tell why. Just as little satisfactory light was thrown upon the business of the row as upon that of the yellow and black drawers. I suspect that the boy's sharp ears had clearly detected the difference between the sounds made by a man micturating and a woman. The analysis succeeded in forcing the material somewhat artificially into an expression of the distinction between the two different calls of nature. I can only advise those of my readers who have not as yet themselves conducted an analysis not to try to understand everything at once, but to give a kind of unbiased attention to every point that arises and to await further developments.

'April 11. This morning Hans came into our room again and was sent away, as he always has been for the last few days.

'Later on, he began: "Daddy, I thought something: *I was in the bath,*[1] *and then the plumber came and unscrewed it.*[2] *Then he took a big borer and stuck it into my stomach.*"'

Hans's father translated this phantasy as follows: "'I was in bed with Mummy. Then Daddy came and drove me away. With his big penis he pushed me out of my place by Mummy."'

Let us suspend our judgement for the present.

'He went on to relate a second idea that he had had: "We were travelling on the train to Gmunden. In the station we put on our clothes; but we couldn't get it done in time, and the train carried us on."

1 'Hans's mother gives him his bath.'

2 'To take it away to be repaired.'

'Later on, I asked: "Have you ever seen a horse doing lumf?"

'*Hans*: "Yes, very often."

'*I*: "Does it make a loud row when it does lumf?"

'*Hans*: "Yes." [66]

'*I*: "What does the row remind you of?"

'*Hans*: "Like when lumf falls into the chamber."

'The bus-horse that falls down and makes a row with its feet is no doubt – a lumf falling and making a noise. His fear of defaecation and his fear of heavily loaded carts is equivalent to the fear of a heavily loaded stomach.'

In this roundabout way Hans's father was beginning to get a glimmering of the true state of affairs.

'April 11. At luncheon Hans said: "If only we had a bath at Gmunden, so that I didn't have to go to the public baths!" It is a fact that at Gmunden he was always taken to the neighbouring public baths to be given a hot bath – a proceeding against which he used to protest with passionate tears. And in Vienna, too, he always screams if he is made to sit or lie in the big bath. He must be given his bath kneeling or standing.'

Hans was now beginning to bring fuel to the analysis in the shape of spontaneous utterances of his own. This remark of his established the connection between his two last phantasies – that of the plumber who unscrewed the bath and that of the unsuccessful journey to Gmunden. His father had correctly inferred from the latter that Hans had some aversion to Gmunden. This, by the way, is another good reminder of the fact that what emerges from the unconscious is to be understood in the light not of what goes before but of what comes after.

'I asked him whether he was afraid, and if so of what.

'*Hans*: "Because of falling in."

'*I*: "But why were you never afraid when you had your bath in the little bath?"

'*Hans*: "Why, I sat in that one. I couldn't lie down in it, it was too small."

'*I*: "When you went in a boat at Gmunden weren't you afraid of falling [67] into the water?"

'*Hans*: "No, because I held on, so I couldn't fall in. It's only in the big bath that I'm afraid of falling in."

'*I*: "But Mummy baths you in it. Are you afraid of Mummy dropping you in the water?"

'*Hans*: "I'm afraid of her letting go and my head going in."

'*I*: "But you know Mummy's fond of you and won't let go of you."

'*Hans*: "I only just thought it."

'*I*: "Why?"

'*Hans*: "I don't know at all."

'*I*: "Perhaps it was because you'd been naughty and thought she didn't love you any more?"

'*Hans*: "Yes."

'*I*: "When you were watching Mummy giving Hanna her bath, perhaps you wished she would let go of her so that Hanna should fall in?"

'*Hans*: "Yes."'

Hans's father, we cannot help thinking, had made a very good guess.

'April 12. As we were coming back from Lainz in a second-class carriage, Hans looked at the black leather upholstery of the seats, and said: "Ugh! that makes me spit! Black drawers and black horses make me spit too, because I have to do lumf."

'*I*: "Perhaps you saw something of Mummy's that was black, and it frightened you?"

'*Hans*: "Yes."

'*I*: "Well, what was it?"

'*Hans*: "I don't know. A black blouse or black stockings."

'*I*: "Perhaps it was black hair near her widdler, when you were curious and looked."

'*Hans* (defending himself): "But I didn't see her widdler."

[68] 'Another time, he was frightened once more at a cart driving out of the yard gates opposite. "Don't the gates look like a behind?" I asked.

'*He*: "And the horses are the lumfs!" Since then, whenever he sees a cart driving out, he says: "Look, there's a 'lumfy' coming!" This form of the word ("lumfy") is quite a new one to him; it sounds like a term of endearment. My sister-in-law always calls her child "Wumfy".

'On April 13 he saw a piece of liver in the soup and exclaimed: "Ugh! A lumf!" Meat croquettes, too, he eats with evident reluctance, because their form and colour remind him of lumf.

'In the evening my wife told me that Hans had been out on the balcony and had said: "I thought to myself Hanna was on the balcony and fell down off it." I had once or twice told him to be careful that Hanna did not get too near the balustrade when she was out on the balcony; for the railing was designed in the most unpractical way (by a

metalworker of the Secessionist movement) and had big gaps in it which I had to have filled in with wire netting. Hans's repressed wish was very transparent. His mother asked him if he would rather Hanna were not there, to which he said "Yes".

'April 14. The theme of Hanna is uppermost. As you may remember from earlier records, Hans felt a strong aversion to the newborn baby that robbed him of a part of his parents' love. This dislike has not entirely disappeared and is only partly overcompensated by an exaggerated affection.[1] He has already several times expressed a wish that the stork should bring no more babies and that we should pay him money not to bring any more "out of the big box" where babies are. (Compare his fear [69]
of furniture vans. Does not a bus look like a big box?) Hanna screams such a lot, he says, and that's a nuisance to him.

'Once he suddenly said: "Can you remember when Hanna came? She lay beside Mummy in bed, so nice and good." (His praise rang suspiciously hollow.)

'And then as regards downstairs, outside the house. There is again great progress to be reported. Even drays cause him less alarm. Once he called out, almost with joy: "Here comes a horse with something black on its mouth!" And I was at last able to establish the fact that it was a horse with a leather muzzle. But Hans was not in the least afraid of this horse.

'Once he knocked on the pavement with his stick and said: "I say, is there a man underneath? – someone buried? – or is that only in the cemetery?" So he is occupied not only with the riddle of life but with the riddle of death.

'When we got indoors again I saw a box standing in the front hall, and Hans said: "Hanna travelled with us to Gmunden in a box like that. Whenever we travelled to Gmunden she travelled with us in the box. You don't believe me again? Really, Daddy. Do believe me. We got a big box and it was full of babies; they sat in the bath." (A small bath had been packed inside the box.) "I put them in it. Really and truly. I can remember quite well."[2]

'*I*: "What can you remember?"

1 The 'Hanna' theme immediately succeeded the 'lumf' theme, and the explanation of this at length begins to dawn upon us: Hanna was a lumf herself – babies were lumfs.

2 Hans was now going off into a phantasy. As we can see, a box and a bath have the same meaning for him: they both represent the space which contains the babies. We must bear in mind Hans's repeated assurances on this point.

'*Hans*: "That Hanna travelled in the box; because I haven't forgotten about it. My word of honour!"

'*I*: "But last year Hanna travelled with us in the railway carriage."

'*Hans*: "*But before that she always travelled with us in the box.*"

[70] '*I*: "Didn't Mummy have the box?"

'*Hans*: "Yes. Mummy had it."

'*I*: "Where?"

'*Hans*: "At home in the attic."

'*I*: "Perhaps she carried it about with her?"[1]

'*Hans*: "No. And when we travel to Gmunden this time Hanna'll travel in the box again."

'*I*: "And how did she get out of the box, then?"

'*Hans*: "She was taken out."

'*I*: "By Mummy?"

'*Hans*: "Mummy and me. Then we got into the carriage, and Hanna rode on the horse, and the coachman said: 'Gee-up'. The coachman sat up in front. Were you there too? Mummy knows all about it. Mummy doesn't know; she's forgotten about it already, but don't tell her anything!"

'I made him repeat the whole of this.

'*Hans*: "Then Hanna got out."

'*I*: "Why, she couldn't walk at all then."

'*Hans*: "Well then, we lifted her down."

'*I*: "But how could she have sat on the horse? She couldn't sit up at all last year."

'*Hans*: "Oh yes, she sat up all right, and called out 'Gee-up', and whipped with her whip – 'Gee-up! Gee-up!' – the whip I used to have. The horse hadn't any stirrups, but Hanna rode it. I'm not joking, you know, Daddy.'"

What can be the meaning of the boy's obstinate persistence in all this nonsense? Oh no, it was no nonsense: it was parody, it was Hans's revenge upon his father. It was as much as to say: '*If you really expect me to believe that the stork brought Hanna in October, when even in the summer, while we were travelling to Gmunden, I'd noticed how big* [71] *Mother's stomach was – then I expect you to believe my lies*.' What can be the meaning of the assertion that even the summer before the last Hanna had travelled with them to Gmunden 'in the box', except that

1 The box was of course the womb. (Hans's father was trying to let him know that he understood this.) And the same is true of the caskets in which so many of the heroes of mythology were exposed, from the time of King Sargon of Agade onwards. – [*Added* 1923:] Cf. Rank's study, *Der Mythus von der Geburt des Helden*, 1909.

he knew about his mother's pregnancy? His holding out the prospect of a repetition of this journey in the box in each successive year exemplifies a common way in which unconscious thoughts from the past emerge into consciousness; or it may have special reasons and express his dread of seeing a similar pregnancy repeated on their next summer holiday. We now see, moreover, what the circumstances were that had made him take a dislike to the journey to Gmunden, as his second phantasy had indicated [p. 50 above].

'Later on, I asked him how Hanna had actually come into his mother's bed after she was born.'

This gave Hans a chance of letting himself go and fairly 'stuffing' his father.

'*Hans*: "Hanna just came. Frau Kraus" (the midwife) "put her in the bed. She couldn't walk, of course. But the stork carried her in his beak. Of course she couldn't walk." (He went on without a pause.) "The stork came up the stairs up to the landing, and then he knocked and everybody was asleep, and he had the right key and unlocked the door and put Hanna in *your*[1] bed, and Mummy was asleep – no, the stork put her in *her* bed. It was the middle of the night, and then the stork put her in the bed very quietly, he didn't trample about at all, and then he took his hat and went away again. No, he hadn't got a hat."

'*I*: "Who took his hat? The doctor, perhaps?"

'*Hans*: "Then the stork went away; he went home, and then he rang at the door, and everyone in the house stopped sleeping. But don't tell this to Mummy or Tini" (the cook). "It's a secret."

'*I*: "Are you fond of Hanna?"

'*Hans*: "Oh yes, very fond." [72]

'*I*: "Would you rather that Hanna weren't alive or that she were?"

'*Hans*: "I'd rather she weren't alive."

'*I*: "Why?"

'*Hans*: "At any rate she wouldn't scream so, and I can't bear her screaming."

'*I*: "Why, you scream yourself."

'*Hans*: "But Hanna screams too."

'*I*: "Why can't you bear it?"

'*Hans*: "Because she screams so loud."

'*I*: "Why, she doesn't scream at all."

'*Hans*: "When she's whacked on her bare bottom, then she screams."

1 Ironical, of course. Like his subsequent request that none of the secret should be betrayed to his mother.

'*I*: "Have you ever whacked her?"

'*Hans*: "When Mummy whacks her on her bottom, then she screams."

'*I*: "And you don't like that?"

'*Hans*: "No. . . . Why? Because she makes such a row with her screaming."

'*I*: "If you'd rather she weren't alive, you can't be fond of her at all."

'*Hans* (assenting): "H'm, well."

'*I*: "That was why you thought when Mummy was giving her her bath, if only she'd let go, Hanna would fall into the water . . ."

'*Hans* (taking me up): ". . . and die."

'*I*: "And then you'd be alone with Mummy. A good boy doesn't wish that sort of thing, though."

'*Hans*: "*But he may* THINK *it.*"

'*I*: "But that isn't good."

'*Hans*: "*If he thinks it, it* IS *good all the same, because you can write it to the Professor.*"[1]

[73] 'Later on I said to him: "You know, when Hanna gets bigger and can talk, you'll be fonder of her."

'*Hans*: "Oh no. I *am* fond of her. In the autumn, when she's big, I shall go with her to the Stadtpark quite alone, and explain everything to her."

'As I was beginning to give him some further enlightenment, he interrupted me, probably with the intention of explaining to me that it was not so wicked of him to wish that Hanna was dead.

'*Hans*: "You know, all the same, she'd been alive a long time even before she was here. When she was with the stork she was alive too."

'*I*: "No. Perhaps she wasn't with the stork after all."

'*Hans*: "Who brought her, then? The stork had got her."

'*I*: "Where did he bring her from, then?"

'*Hans*: "Oh – from him."

'*I*: "Where had he got her, then?"

'*Hans*: "In the box; in the *stork box*."

'*I*: "Well, and what does the box look like?"

'*Hans*: "Red. Painted red." (Blood?)

'*I*: "Who told you that?"

'*Hans*: "Mummy . . . I thought it to myself . . . it's in the book."

'*I*: "In what book?"

'*Hans*: "In the picture-book." (I made him fetch his first picture-book. In it was a picture of a stork's nest with storks, on a red chimney. This

1 Well done, Little Hans! I could wish for no better understanding of psychoanalysis from any grown-up.

was the box. Curiously enough, on the same page there was also a picture of a horse being shod.[1] Hans had transferred the babies into the box, as they were not to be seen in the nest.)

'*I*: "And what did the stork do with her?"

'*Hans*: "Then the stork brought Hanna here. In his beak. You know, [74] the stork that's at Schönbrunn, and that bit the umbrella." (A reminiscence of an episode at Schönbrunn.)

'*I*: "Did you see how the stork brought Hanna?"

'*Hans*: "Why, I was still asleep, you know. A stork can never bring a little girl or a little boy in the morning."

'*I*: "Why?"

'*Hans*: "He can't. A stork can't do it. Do you know why? So that people shan't see. And then, all at once, in the morning, there's a little girl there."[2]

'*I*: "But, all the same, you were curious at the time to know how the stork did it?"

'*Hans*: "Oh yes."

'*I*: "What did Hanna look like when she came?"

'*Hans* (hypocritically): "All white and lovely. So pretty."

'*I*: "But when you saw her the first time you didn't like her."

'*Hans*: "Oh, I did; very much!"

'*I*: "You were surprised that she was so small, though."

'*Hans*: "Yes."

'*I*: "How small was she?"

'*Hans*: "Like a baby stork."

'*I*: "Like what else? Like a lumf, perhaps?"

'*Hans*: "Oh no. A lumf's much bigger . . . a bit smaller than Hanna, really.'"

I had predicted to his father that it would be possible to trace back Hans's phobia to thoughts and wishes occasioned by the birth of his baby sister. But I had omitted to point out that according to the sexual theory of children a baby is a 'lumf', so that Hans's path would lie through the excremental complex. It was owing to this neglect on my [75] part that the progress of the case became temporarily obscured. Now

1 [In view of what follows presently, it may be worth remarking that the German word for 'shod' ('*beschlagen*') differs in only a single letter from that for 'beaten' ('*geschlagen*').]

2 There is no need to find fault with Hans's inconsistencies. In the previous conversation his disbelief in the stork had emerged from his unconscious and had been coupled with the exasperation he felt against his father for making so many mysteries. But he had now become calmer and was answering his father's questions with official thoughts in which he had worked out glosses upon the many difficulties involved in the stork hypothesis.

that the matter had been cleared up, Hans's father attempted to examine the boy a second time upon this important point.

The next day, 'I got Hans to repeat what he had told me yesterday. He said: "Hanna travelled to Gmunden in the big box, and Mummy travelled in the railway carriage, and Hanna travelled in the luggage train with the box; and then when we got to Gmunden Mummy and I lifted Hanna out and put her on the horse. The coachman sat up in front, and Hanna had the old whip" (the whip he had last year) "and whipped the horse and kept on saying 'Gee-up', and it was such fun, and the coachman whipped too. – The coachman didn't whip at all, because Hanna had the whip. – The coachman had the reins – Hanna had the reins too." (On each occasion we drove in a carriage from the station to the house. Hans was here trying to reconcile fact and fancy.) "At Gmunden we lifted Hanna down from the horse, and she walked up the steps by herself." (Last year, when Hanna was at Gmunden, she was eight months old. The year before that – and Hans's phantasy evidently related to that time – his mother had been five months gone with child when we arrived at Gmunden.)

'*I*: "Last year Hanna was there."

'*Hans*: "Last year she drove in the carriage; but the year before that, when she was living with us . . ."

'*I*: "Was she with us already then?"

'*Hans*: "Yes. You were always there; you used always to go in the boat with me, and Anna was our servant."

'*I*: "But that wasn't last year. Hanna wasn't alive then."

'*Hans*: "*Yes, she was alive then*. Even while she was still travelling in
[76] the box she could run about and she could say 'Anna'." (She has only been able to do so for the last four months.)

'*I*: "But she wasn't with us at all then."

'*Hans*: "Oh yes, she was; she was with the stork."

'*I*: "How old is she, then?"

'*Hans*: "She'll be two years old in the autumn. Hanna *was* there, you know she was."

'*I*: "And when was she with the stork in the stork box?"

'*Hans*: "A long time before she travelled in the box, a very long time."

'*I*: "How long has Hanna been able to walk, then? When she was at Gmunden she couldn't walk yet."

'*Hans*: "Not last year; but other times she could."

'*I*: "But Hanna's only been at Gmunden once."

'*Hans*: "No. She's been twice. Yes, that's it. I can remember quite well. Ask Mummy, she'll tell you soon enough."

'*I*: "It's not true, all the same."

'*Hans*: "Yes, it *is* true. *When she was at Gmunden the first time she could walk and ride, and later on she had to be carried.* – No. It was only later on that she rode, and last year she had to be carried."

'*I*: "But it's only quite a short time that she's been walking. At Gmunden she couldn't walk."

'*Hans*: "Yes. Just you write it down. I can remember quite well. – Why are you laughing?"

'*I*: "Because you're a fraud; because you know quite well that Hanna's only been at Gmunden once."

'*Hans*: "No, that isn't true. The first time she rode on the horse . . . and the second time . . ." (He showed signs of evident uncertainty.)

'*I*: "Perhaps the horse was Mummy?"

'*Hans*: "No, a real horse in a fly."

'*I*: "But we used always to have a carriage with two horses."

'*Hans*: "Well, then, it was a carriage and pair."

'*I*: "What did Hanna eat inside the box?" [77]

'*Hans*: "They put in bread and butter for her, and herring, and radishes" (the sort of thing we used to have for supper at Gmunden), "and as Hanna went along she buttered her bread and butter and ate fifty meals."

'*I*: "Didn't Hanna scream?"

'*Hans*: "No."

'*I*: "What did she do, then?"

'*Hans*: "Sat quite still inside."

'*I*: "Didn't she push about?"

'*Hans*: "No, she kept on eating all the time and didn't stir once. She drank up two big mugs of coffee – by the morning it was all gone, and she left the bits behind in the box, the leaves of the two radishes and a knife for cutting the radishes. She gobbled everything up like a hare: one minute and it was all finished. It *was* a joke. Hanna and I really travelled together in the box; I slept the whole night in the box." (We did in fact, two years ago, make the journey to Gmunden by night.) "And Mummy travelled in the railway carriage. And we kept on eating all the time when we were driving in the carriage, too; it *was* jolly. – She didn't ride on a horse at all . . ." (he now became undecided, for he knew that we had driven with two horses) ". . . she sat in the carriage. Yes, that's how it

was, but Hanna and I drove quite by ourselves . . . Mummy rode on the horse, and Karoline" (our maid last year) "on the other . . . I say, what I'm telling you isn't a bit true."

'*I*: "What isn't true?"

'*Hans*: "None of it is. I say, let's put Hanna and me in the box[1] and I'll widdle into the box. I'll just widdle into my knickers; I don't care a bit; there's nothing at all shameful in it. I say, that isn't a joke, you know; but it's great fun, though."

[78] 'Then he told me the story of how the stork came – the same story as yesterday, except that he left out the part about the stork taking his hat when he went away.

'*I*: "Where did the stork keep his latch-key?"

'*Hans*: "In his pocket."

'*I*: "And where's the stork's pocket?"

'*Hans*: "In his beak."

'*I*: "It's in his beak! I've never seen a stork yet with a key in his beak."

'*Hans*: "How else could he have got in? How did the stork come in at the door, then? No, it isn't true; I just made a mistake. The stork rang at the front door and someone let him in."

'*I*: "And how did he ring?"

'*Hans*: "He rang the bell."

'*I*: "How did he do that?"

'*Hans*: "He took his beak and pressed on it with his beak."

'*I*: "And did he shut the door again?"

'*Hans*: "No, a maid shut it. She was up already, you see, and opened the door for him and shut it."

'*I*: "Where does the stork live?"

'*Hans*: "Where? In the box where he keeps the little girls. At Schönbrunn, perhaps."

'*I*: "I've never seen a box at Schönbrunn."

'*Hans*: "It must be farther off, then. – Do you know how the stork opens the box? He takes his beak – the box has got a key, too – he takes his beak, lifts up one" (i.e. one half of the beak) "and unlocks it like this." (He demonstrated the process on the lock of the writing table.) "There's a handle on it too."

'*I*: "Isn't a little girl like that too heavy for him?"

'*Hans*: "Oh no."

'*I*: "I say, doesn't a bus look like a stork box?"

'*Hans*: "Yes."

1 'The box standing in the front hall which we had taken to Gmunden as luggage.'

'*I*: "And a furniture waggon?"

'*Hans*: "And a scallywaggon" ("scallywag" – a term of abuse for naughty children) "too." [79]

'April 17. Yesterday Hans carried out his long-premeditated scheme of going across into the courtyard opposite. He would not do it today, as there was a cart standing at the loading dock exactly opposite the entrance gates. "When a cart stands there," he said to me, "I'm afraid *I shall tease the horses* and they'll fall down and make a row with their feet."

'*I*: "How does one tease horses?"

'*Hans*: "When you're cross with them you tease them, and when you shout 'Gee-up'."[1]

'*I*: "Have you ever teased horses?"

'*Hans*: "Yes, quite often. I'm *afraid* I shall do it, but I don't *really*."

'*I*: "Did you ever tease horses at Gmunden?"

'*Hans*: "No."

'*I*: "But you like teasing them?"

'*Hans*: "Oh yes, very much."

'*I*: "Would you like to whip them?"

'*Hans*: "Yes."

'*I*: "Would you like to beat the horses as Mummy beats Hanna? You like that too, you know."

'*Hans*: "It doesn't do the horses any harm when they're beaten." (I said this to him once to mitigate his fear of seeing horses whipped.) "Once I really did it. Once I had the whip, and whipped the horse, and it fell down and made a row with its feet."

'*I*: "When?"

'*Hans*: "At Gmunden."

'*I*: "A real horse? Harnessed to a cart?"

'*Hans*: "It wasn't in the cart."

'*I*: "Where was it, then?" [80]

'*Hans*: "I just held it so that it shouldn't run away." (Of course, all this sounded most improbable.)

'*I*: "Where was that?"

'*Hans*: "Near the trough."

'*I*: "Who let you? Had the coachman left the horse standing there?"

'*Hans*: "It was just a horse from the stables."

'*I*: "How did it get to the trough?"

1 'Hans has often been very much terrified when drivers beat their horses and shout "Gee-up".'

'*Hans*: "I took it there."

'*I*: "Where from? Out of the stables?"

'*Hans*: "I took it out because I wanted to beat it."

'*I*: "Was there no-one in the stables?"

'*Hans*: "Oh yes, Loisl." (The coachman at Gmunden.)

'*I*: "Did he let you?"

'*Hans*: "I talked nicely to him, and he said I might do it."

'*I*: "What did you say to him?"

'*Hans*: "Could I take the horse and whip it and shout at it. And he said 'Yes'."

'*I*: "Did you whip it a lot?"

'*Hans*: "*What I've told you isn't the least true*."

'*I*: "How much of it's true?"

'*Hans*: "None of it's true; I only told it you for fun."

'*I*: "You never took a horse out of the stables?"

'*Hans*: "Oh no."

'*I*: "But you wanted to."

'*Hans*: "Oh yes, wanted to. I've thought it to myself."

'*I*: "At Gmunden?"

'*Hans*: "No, only here. I thought it in the morning when I was quite undressed; no, in the morning in bed."

'*I*: "Why did you never tell me about it?"

'*Hans*: "I didn't think of it."

'*I*: "You thought it to yourself because you saw it in the street."

'*Hans*: "Yes."

[81] '*I*: "Which would you really like to beat? Mummy, Hanna or me?"

'*Hans*: "Mummy."

'*I*: "Why?"

'*Hans*: "I should just like to beat her."

'*I*: "When did you ever see anyone beating their Mummy?"

'*Hans*: "I've never seen anyone do it, never in all my life."

'*I*: "And yet you'd just like to do it. How would you like to set about it?"

'*Hans*: "With a carpet-beater." (His mother often threatens to beat him with the carpet-beater.)

'I was obliged to break off the conversation for today.

'In the street Hans explained to me that buses, furniture vans and coal carts were stork-box carts.'

That is to say, pregnant women. Hans's access of sadism immediately before cannot be unconnected with the present theme.

'April 21. This morning Hans said that he had thought as follows: "There was a train at Lainz and I travelled with my Lainz Grandmummy to the Hauptzollamt station. You hadn't got down from the bridge yet, and the second train was already at St Veit.[1] When you came down, the train was there already, and we got on."

'(Hans was at Lainz yesterday. In order to get on to the departure platform one has to cross a bridge. From the platform one can see along the line as far as St Veit station. The whole thing is a trifle obscure. Hans's original thought had no doubt been that he had gone off by the first train, which I had missed, and that then a second train had come in from Unter St Veit and that I had gone after him on it. But he had distorted a part of this runaway phantasy, so that he said finally: "Both of us only got away by the second train." [82]

'This phantasy is related to the last one [p. 50 above], which was not interpreted, and according to which we took too long to put on our clothes in the station at Gmunden, so that the train carried us on.)

'Afternoon, in front of the house. Hans suddenly ran indoors as a carriage with two horses came along. I could see nothing unusual about it, and asked him what was wrong. "The horses are so proud," he said, "that I'm afraid they'll fall down." (The coachman was reining the horses in tight, so that they were trotting with short steps and holding their heads high. In fact their action *was* "proud".)

'I asked him who it really was that was so proud.

'*He*: "You are, when I come into bed with Mummy."

'*I*: "So you want me to fall down?"

'*Hans*: "Yes. You've got to be naked" (meaning "bare-foot", as Fritzl had been) "and knock up against a stone and bleed, and then I'll be able to be alone with Mummy for a little bit at all events. When you come up into our flat I'll be able to run away quick so that you don't see."

'*I*: "Can you remember who it was that knocked up against the stone?"

'*He*: "Yes, Fritzl."

'*I*: "When Fritzl fell down, what did you think?"[2]

'*He*: "That *you* should hit the stone and tumble down."

'*I*: "So you'd like to go to Mummy?"

'*He*: "Yes."

'*I*: "What do I really scold you for?"

'*He*: "I don't know." (!!)

1 [Unter St Veit: one station farther away from Vienna than Lainz. Owing to the straightness of the line, a traveller waiting on the platform at Lainz for a train to Vienna can see it approaching all the way from Unter St Veit and even beyond.]

2 So that, in fact, Fritzl *did* fall down – which he at one time denied. [See p. 45 above.]

'*I*: "Why?"

'*He*: "Because you're cross."

[83] '*I*: "But that's not true."

'*Hans*: "Yes, it *is* true. You're cross. I know you are. It must be true."

'Evidently, therefore, my explanation that only *little* boys come into bed with their Mummies and that *big* ones sleep in their own beds had not impressed him very much.

'I suspect that his desire to "tease" the horse, i.e. to beat it and shout at it, does not apply to his mother, as he pretended, but to me. No doubt he only put her forward because he was unwilling to admit the alternative to me. For the last few days he has been particularly affectionate to me.'

Speaking with the air of superiority which is so easily acquired 'after the event' ['*nachträglich*'], we may correct Hans's father, and explain that the boy's wish to 'tease' the horse had two constituents; it was compounded of an obscure sadistic desire for his mother and of a clear impulse for revenge against his father. The latter could not be reproduced until the former's turn had come to emerge in connection with the pregnancy complex. In the process of the formation of a phobia from the unconscious thoughts underlying it, condensation [*Verdichtung*][T] takes place; and for that reason the course of the analysis can never follow that of the development of the neurosis.

'April 22. This morning Hans again thought something to himself: "A street boy was riding on a truck, and the guard came and undressed the boy quite naked and made him stand there till next morning, and in the morning the boy gave the guard 50,000 florins so that he could go on riding on the truck."

'(The Nordbahn [Northern Railway] runs past opposite our house. In a siding there stood a trolley on which Hans once saw a street boy riding. He wanted to do so too; but I told him it was not allowed, and that if he did the guard would be after him. A second element in this phantasy is Hans's repressed wish to be naked.)'

[84] It has been noticeable for some time that Hans's imagination was being coloured by images derived from traffic, and was advancing systematically from horses, which draw vehicles, to railways. In the same way a railway phobia eventually becomes associated with every street phobia.[1]

'At lunchtime I was told that Hans *had been playing all the morning with an india-rubber doll which he called Grete.* [Cf. p. 25 above.] *He had*

1 [This characteristic of phobias is discussed below on p. 95 f.]

pushed a small penknife in through the opening to which the little tin squeaker had originally been attached, and had then torn the doll's legs apart so as to let the knife drop out. He had said to the nursemaid, pointing between the doll's legs: "Look, there's its widdler!"

'*I*: "What was it you were playing at with your doll today?"

'*Hans*: "I tore its legs apart. Do you know why? Because there was a knife inside it belonging to Mummy. I put it in at the place where the button[1] squeaks, and then I tore apart its legs and it came out there."

'*I:* "Why did you tear its legs apart? So that you could see its widdler?"

'*He*: "Its widdler was there before; I could have seen it anyhow."

'*I*: "What did you put the knife in for?"

'*He*: "I don't know."

'*I*: "Well, what does the knife look like?"

'He brought it to me.

'*I*: "Did you think it was a baby, perhaps?"

'*He*: "No, I didn't think anything at all; but I believe the stork got a baby once – or someone."

'*I*: "When?"

'*He*: "Once. I heard so – or didn't I hear it at all? – or did I say it wrong?" [85]

'*I*: "What does 'say it wrong' mean?"

'*He*: "That it's not true."

'*I*: "Everything one says is a bit true."

'*He*: "Well, yes, a little bit."

'*I* (after changing the subject): "How do you think chickens are born?"

'*He*: "The stork just makes them grow; the stork makes chickens grow – no, God does."

'I explained to him that chickens lay eggs, and that out of the eggs there come other chickens.

'Hans laughed.

'*I*: "Why do you laugh?"

'*He*: "Because I like what you've told me."

'He said he had seen it happen already.

'*I*: "Where?"

'*Hans*: "You did it."

'*I*: "Where did I lay an egg?"

1 ['*der Knopf*.' So in the first edition. In subsequent ones '*der Kopf*' ('the head'). This latter is almost certainly wrong: see below, p. 100, where the hole is described as being 'in the body'.]

'*Hans*: "At Gmunden; you laid an egg in the grass, and all at once a chicken came hopping out. You laid an egg once; I know you did, I know it for certain. Because Mummy said so."

'*I*: "I'll ask Mummy if that's true."

'*Hans*: "It isn't true a bit. But *I* once laid an egg, and a chicken came hopping out."

'*I*: "Where?"

'*Hans*: "At Gmunden I lay down in the grass – no, I knelt down – and the children didn't look on at me, and all at once in the morning I said: 'Look for it, children; I laid an egg yesterday.' And all at once they looked, and all at once they saw an egg, and out of it there came a Little Hans. Well, what are you laughing for? Mummy didn't know about it, and Karoline didn't know, because no-one was looking on, and all at
[86] once I laid an egg, and all at once it was there. Really and truly. Daddy, when does a chicken grow out of an egg? When it's left alone? Must it be eaten?"

'I explained the matter to him.

'*Hans*: "All right, let's leave it with the hen; then a chicken'll grow. Let's pack it up in the box and let's take it to Gmunden."'

As his parents still hesitated to give him the information which was already long overdue, Little Hans had by a bold stroke taken the conduct of the analysis into his own hands. By means of a brilliant symptomatic act, '*Look!*' he had said to them, '*this is how I imagine that a birth takes place*.' What he had told the maidservant about the meaning of his game with the doll had been insincere; to his father he explicitly denied that he had only wanted to see its widdler. After his father had told him, as a kind of payment on account, how chickens come out of eggs, Hans gave a combined expression to his dissatisfaction, his mistrust and his superior knowledge in a charming piece of persiflage, which culminated with his last words in an unmistakable allusion to his sister's birth.

'*I*: "What were you playing at with your doll?"

'*Hans*: "I said 'Grete' to her."

'*I*: "Why?"

'*Hans*: "Because I said 'Grete' to her."

'*I*: "How did you play?"

'*Hans*: "I just looked after her like a real baby."

'*I*: "Would you like to have a little girl?"

'*Hans*: "Oh yes. Why not? I should like to have one, but Mummy mustn't have one; I don't like that."'

(He has often expressed this view before. He is afraid of losing still more of his position if a third child arrives.)

'*I*: "But only women have children."

'*Hans*: "I'm going to have a little girl."

'*I*: "Where will you get her, then?"

'*Hans*: "Why, from the stork. *He takes the little girl out*, and all at once the little girl lays an egg, and out of the egg there comes another [87] Hanna – another Hanna. Out of Hanna there comes another Hanna. No, *one* Hanna comes out."

'*I*: "You'd like to have a little girl."

'*Hans*: "*Yes, next year I'm going to have one*, and she'll be called Hanna too."

'*I*: "But why isn't Mummy to have a little girl?"

'*Hans*: "Because *I* want to have a little girl for once."

'*I*: "But you can't have a little girl."

'*Hans*: "Oh yes, boys have girls and girls have boys."[1]

'*I*: "Boys don't have children. Only women, only Mummies have children."

'*Hans*: "But why shouldn't I?"

'*I*: "Because God's arranged it like that."

'*Hans*: "But why don't *you* have one? Oh yes, you'll have one all right. Just you wait."

'*I*: "I shall have to wait some time."

'*Hans*: "But I belong to you."

'*I*: "But Mummy brought you into the world. So you belong to Mummy and me."

'*Hans*: "Does Hanna belong to me or to Mummy?"

'*I*: "To Mummy."

'*Hans*: "No, to me. *Why not to me and Mummy?*"

'*I*: "Hanna belongs to me, Mummy and you."

'*Hans*: "There you are, you see."'

So long as the child is in ignorance of the female genitals, there is naturally a vital gap in his comprehension of sexual matters.

'On April 24 my wife and I enlightened Hans up to a certain point: we told him that children grow inside their Mummy, and are then brought into the world by being pressed out of her like a "lumf", and that this involves a great deal of pain.

'In the afternoon we went out in front of the house. There was a visible [88] improvement in his state. He ran after carts, and the only thing that

1 Here is another bit of infantile sexual theory with an unsuspected meaning.

betrayed a remaining trace of his anxiety was the fact that he did not venture away from the neighbourhood of the street door and could not be induced to go for any considerable walk.

'On April 25 Hans butted me in the stomach with his head, as he has already done once before [p. 33 above]. I asked him if he was a goat.

'"Yes," he said, "a ram." I enquired where he had seen a ram.

'*He*: "At Gmunden: Fritzl had one." (Fritzl had a real lamb to play with.)

'*I*: "You must tell me about the lamb. What did it do?"

'*Hans*: "You know, Fräulein Mizzi" (a schoolmistress who lived in the house) "used always to put Hanna on the lamb, but it couldn't stand up then and it couldn't butt. If you went up to it it used to butt, because it had horns. Fritzl used to lead it on a string and tie it to a tree. He always tied it to a tree."

'*I*: "Did the lamb butt you?"

'*Hans*: "It jumped up at me; Fritzl took me up to it once. . . . I went up to it once and didn't know, and all at once it jumped up at me. It was such fun – I wasn't frightened."

'This was certainly untrue.

'*I*: "Are you fond of Daddy?"

'*Hans*: "Oh yes."

'*I*: "Or perhaps not."

'Hans was playing with a little toy horse. At that moment the horse fell down, and Hans shouted out: "The horse has fallen down! Look what a row it's making!"

'*I*: "You're a little vexed with Daddy because Mummy's fond of him."

'*Hans*: "No."

[89] '*I*: "Then why do you always cry whenever Mummy gives me a kiss? It's because you're jealous."

'*Hans*: "Jealous, yes."

'*I*: "You'd like to be Daddy yourself."

'*Hans*: "Oh yes."

'*I*: "What would you like to do if you were Daddy?"

'*Hans*: "And you were Hans? I'd like to take you to Lainz every Sunday – no, every weekday too. If I were Daddy I'd be ever so nice and good."

'*I*: "But what would you like to do with Mummy?"

'*Hans*: "Take her to Lainz, too."

'*I*: "And what besides?"

'*Hans*: "Nothing."

'*I*: "Then why were you jealous?"

'*Hans*: "I don't know."

'*I*: "Were you jealous at Gmunden, too?"

'*Hans*: "Not at Gmunden." (This is not true.) "At Gmunden I had my own things. I had a garden at Gmunden and children too."

'*I*: "Can you remember how the cow got a calf?"

'*Hans*: "Oh yes. It came in a cart." (No doubt he had been told this at Gmunden; another attack on the stork theory.) "And another cow pressed it out of its behind." (This was already the fruit of his enlightenment, which he was trying to bring into harmony with the cart theory.)

'*I*: "It isn't true that it came in a cart; it came out of the cow in the cowshed."

'Hans disputed this, saying that he had seen the cart in the morning. I pointed out to him that he had probably been told this about the calf having come in a cart. In the end he admitted this, and said: "Most likely Berta told me, or not – or perhaps it was the landlord. He was there and it was at night, so it *is* true after all, what I've been telling you – or it seems to me nobody told me; I thought it to myself in the night."

'Unless I am mistaken, the calf was taken away in a cart; hence [90] the confusion.

'*I*: "Why didn't you think it was the stork that brought it?"

'*Hans*: "I didn't want to think that."

'*I*: "But you thought the stork brought Hanna?"

'*Hans*: "In the morning" (of the confinement) "I thought so. – I say, Daddy, was Herr Reisenbichler" (our landlord) "there when the calf came out of the cow?"[1]

'*I*: "I don't know. Do you think he was?"

'*Hans*: "I think so. . . . Daddy, have you noticed now and then that horses have something black on their mouths?"

'*I*: "I've noticed it now and then in the street at Gmunden."[2]

'*I*: "Did you often get into bed with Mummy at Gmunden?"

'*Hans*: "Yes."

'*I*: "And you used to think to yourself you were Daddy?"

'*Hans*: "Yes."

'*I*: "And then you felt afraid of Daddy?"

'*Hans*: "*You know everything; I didn't know anything.*"

1 Hans, having good reason to mistrust information given him by grown-up people, was considering whether the landlord might not be more trustworthy than his father.

2 The train of thought is as follows. For a long time his father had refused to believe what he said about there being something black on horses' mouths, but finally it had been verified [p. 53 above].

'*I*: "When Fritzl fell down you thought: 'If only Daddy would fall down like that!' And when the lamb butted you you thought: 'If only it would butt Daddy!' Can you remember the funeral at Gmunden?" (The first funeral that Hans had seen. He often recalls it, and it is no doubt a screen memory [*Deckerinnerung*][T].)

'*Hans*: "Yes. What about it?"

'*I*: "You thought then that if only Daddy were to die you'd be Daddy."

'*Hans*: "Yes."

'*I*: "What carts are you still afraid of?"

[91] '*Hans*: "All of them."

'*I*: "You know that's not true."

'*Hans*: "I'm not afraid of carriages [with pairs of horses] or cabs with one horse. I'm afraid of buses and luggage carts, but only when they're loaded up, not when they're empty. When there's one horse and the cart's loaded full up, then I'm afraid; but when there are two horses and it's loaded full up, then I'm not afraid."

'*I*: "Are you afraid of buses because there are so many people inside?"

'*Hans*: "Because there's so much luggage on the top."

'*I*: "When Mummy was having Hanna, was she loaded full up too?"

'*Hans*: "Mummy'll be loaded full up again when she has another one, when another one begins to grow, when another one's inside her."

'*I*: "And you'd like that?"

'*Hans*: "Yes."

'*I*: "You said you didn't want Mummy to have another baby."

'*Hans*: "Well, then she won't be loaded up again. Mummy said if Mummy didn't want one, God didn't want one either. If Mummy doesn't want one she won't have one." (Hans naturally asked yesterday if there were any more babies inside Mummy. I told him not, and said that if God did not wish it none would grow inside her.)

'*Hans*: "But Mummy told me if *she* didn't want it no more'd grow, and you say if *God* doesn't want it."

'So I told him it was as I had said, upon which he observed: "You were there, though, weren't you? You know better, for certain." He then proceeded to cross-question his mother, and she reconciled the two statements by declaring that if she didn't want it God didn't want it either.[I]

[92] '*I*: "It seems to me that, all the same, you do wish Mummy would have a baby."

1 *Ce que femme veut Dieu veut*. But Hans, with his usual acumen, had once more put his finger upon a most serious problem. [It seems likely that the whole passage from the words 'Hans naturally asked yesterday . . .' down to '. . . God didn't want it either' should be in brackets, and that it is all a report of what had happened the day before. When Freud was consulted on this point by the translators (in 1923), he agreed that this was probably so, but preferred to have the text left unaltered, since it was a transcript of 'Little Hans's' father's report.]

'*Hans*: "But I don't want it to happen."

'*I*: "But you wish for it?"

'*Hans*: "Oh yes, *wish*."

'*I*: "Do you know why you wish for it? It's because you'd like to be Daddy."

'*Hans*: "Yes. . . . How does it work?"

'*I*: "How does what work?"

'*Hans*: "You say Daddies don't have babies; so how does it work, my wanting to be Daddy?"

'*I*: "You'd like to be Daddy and married to Mummy; you'd like to be as big as me and have a moustache; and you'd like Mummy to have a baby."

'*Hans*: "And, Daddy, when I'm married I'll only have one if I want to, when I'm married to Mummy, and if I don't want a baby, God won't want it either, when I'm married."

'*I*: "Would you like to be married to Mummy?"

'*Hans*: "Oh yes."'

It is easy to see that Hans's enjoyment of his phantasy was interfered with by his uncertainty as to the part played by fathers and by his doubts as to whether the begetting of children would be under his control.

'On the evening of the same day, as Hans was being put to bed, he said to me: "I say, d'you know what I'm going to do now? Now I'm going to talk to Grete till ten o'clock; she's in bed with me. My children are always in bed with me. Can you tell me why that is?" – As he was very sleepy already, I promised him that we should write it down next day, [93] and he went to sleep.

'I have already noticed in earlier records that since Hans's return from Gmunden he has constantly been having phantasies about "his children" [e.g. p. 10 f. above], has carried on conversations with them, and so on.[1]

'So on April 26 I asked him why he was always thinking of his children.

'*Hans*: "Why? *Because I should so like to have children; but I don't ever want it; I shouldn't like to have them.*"[2]

'*I*: "Have you always imagined that Berta and Olga and the rest were your children?"

1 There is no necessity on this account to assume in Hans the presence of a feminine strain of desire for having children. It was with his mother that Hans had had his most blissful experiences as a child, and he was now repeating them, and himself playing the active part, which was thus necessarily that of mother.

2 This startling contradiction was one between phantasy and reality, between wishing and having. Hans knew that in reality he was a child and that the other children would only be in his way; but in phantasy he was a mother and wanted children with whom he could repeat the endearments that he had himself experienced.

'*Hans*: "Yes. Franzl, and Fritzl, and Paul too" (his playmates at Lainz), "and Lodi." This is an invented girl's name, that of his favourite child, whom he speaks of most often – I may here emphasize the fact that the figure of Lodi is not an invention of the last few days, but existed before the date of his receiving the latest piece of enlightenment (April 24).

'*I*: "Who is Lodi? Is she at Gmunden?"

'*Hans*: "No."

'*I*: "Is there a Lodi?"

'*Hans*: "Yes, I know her."

'*I*: "Who is she, then?"

'*Hans*: "The one I've got here."

'*I*: "What does she look like?"

[94] '*Hans*: "Look like? Black eyes, black hair. . . . I met her once with Mariedl" (at Gmunden) "as I was going into the town."

'When I went into the matter it turned out that this was an invention.[1]

'*I*: "So you thought you were their Mummy?"

'*Hans*: "And really I *was* their Mummy."

'*I*: "What did you do with your children?"

'*Hans*: "I had them to sleep with me, the girls and the boys."

'*I*: "Every day?"

'*Hans*: "Why, of course."

'*I*: "Did you talk to them?"

'*Hans*: "When I couldn't get all the children into the bed, I put some of the children on the sofa, and some in the pram, and if there were still some left over I took them up to the attic and put them in the box, and if there were any more I put them in the other box."

'*I*: "So the stork-baby boxes were in the attic?"

'*Hans*: "Yes."

'*I*: "When did you get your children? Was Hanna alive already?"

'*Hans*: "Yes, she had been a long time."

'*I*: "But who did you think you'd got the children from?"

'*Hans*: "*Why, from me.*"[2]

'*I*: "But at that time you hadn't any idea that children came from someone."

'*Hans*: "I thought the stork had brought them." (Clearly a lie and an evasion.)[3]

1 It is possible, however, that Hans had exalted into his ideal someone whom he had met casually at Gmunden. The colour of this ideal's eyes and hair, by the way, was copied from his mother.

2 Hans could not help answering from the auto-erotic point of view.

3 They were the children of his phantasy, that is to say, of his masturbation.

'*I*: "You had Grete in bed with you yesterday, but you know quite well [95]
that boys can't have children."

'*Hans*: "Well, yes. But I believe they can, all the same."

'*I*: "How did you hit upon the name Lodi? No girl's called that. Lotti, perhaps?"

'*Hans*: "Oh no, Lodi. I don't know; but it's a beautiful name, all the same."

'*I* (jokingly): "Perhaps you mean a Schokolodi?"[1]

'*Hans* (promptly): "No, a Saffalodi,[2] . . . because I like eating sausages so much, and salami[3] too."

'*I*: "I say, doesn't a Saffalodi look like a lumf?"

'*Hans*: "Yes."

'*I*: "Well, what does a lumf look like?"

'*Hans*: "Black. You know" (pointing at my eyebrows and moustache), "like this and like this."

'*I*: "And what else? Round like a Saffaladi?"

'*Hans*: "Yes."

'*I*: "When you sat on the chamber and a lumf came, did you think to yourself you were having a baby?"

'*Hans* (laughing): "Yes. Even at —— Street, and here as well."

'*I*: "You know when the bus-horses fell down? [Cf. p. 38 ff. above.] The bus looked like a baby box, and when the black horse fell down it was just like . . ."

'*Hans* (taking me up): ". . . like having a baby."

'*I*: "And what did you think when it made a row with its feet?"

'*Hans*: "Oh, when I don't want to sit on the chamber and would rather play, then I make a row like this with my feet." [Cf. p. 42.] (He stamped his feet.)

'This was why he was so much interested in the question whether [96]
people *liked* or *did not like* having children.

'All day long today Hans has been playing at loading and unloading packing cases; he said he wished he could have a toy waggon and boxes of that kind to play with. What used most to interest him in the courtyard of the Customs House opposite was the loading and unloading of the carts. And he used to be frightened most when a cart had been loaded

1 ['*Schokolade*' is the German for 'chocolate'.]

2 '"Saffaladi" means "*Zervelatwurst*" ["saveloy", a kind of sausage]. My wife is fond of relating how her aunt always calls it "Soffilodi". Hans may have heard this.' [The various spellings of *Saffaladi* used here conform to the original German text.]

3 [Another kind of sausage.]

up and was on the point of driving off. "The horses'll fall down,"[1] he used to say [p. 36 above]. He used to call the doors of the Head Customs House shed "holes" (e.g. the first hole, second hole, third hole, etc.). But now, instead of "hole", he says "behind-hole".

'The anxiety has almost completely disappeared, except that he likes to remain in the neighbourhood of the house, so as to have a line of retreat in case he is frightened. But he never takes flight into the house now, but stops in the street all the time. As we know, his illness began with his turning back in tears while he was out for a walk; and when he was obliged to go for a second walk he only went as far as the Hauptzollamt station on the Stadtbahn, from which our house can still be seen. At the time of my wife's confinement he was of course kept away from her; and his present anxiety, which prevents him from leaving the neighbourhood of the house, is in reality the longing for her which he felt then.

'April 30. Seeing Hans playing with his imaginary children again, "Hullo," I said to him, "are your children still alive? You know quite well a boy can't have any children."

'*Hans*: "I know. I was their Mummy before, *now I'm their Daddy*."

[97] '*I*: "And who's the children's Mummy?"

'*Hans*: "Why, Mummy, and you're their *Grandaddy*."

'*I*: "So then you'd like to be as big as me, and be married to Mummy, and then you'd like her to have children."

'*Hans*: "Yes, that's what I'd like, and then my Lainz Grandmummy" (my mother) "will be their Grannie.'"

Things were moving towards a satisfactory conclusion. The little Oedipus had found a happier solution than that prescribed by destiny. Instead of putting his father out of the way, he had granted him the same happiness that he desired himself: he made him a grandfather and married *him* to his own mother too.

'On May 1 Hans came to me at lunchtime and said: "D'you know what? Let's write something down for the Professor."

'*I*: "Well, and what shall it be?"

'*Hans*: "This morning I was in the WC with all my children. First I did lumf and widdled, and they looked on. Then I put them on the seat and they widdled and did lumf, and I wiped their behinds with paper. D'you

1 Do we not use the word '*niederkommen*' [literally 'to come down'] when a woman is delivered?

know why? Because I'd so much like to have children; then I'd do everything for them – take them to the WC, clean their behinds, and do everything one does with children.'"

After the admission afforded by this phantasy, it will scarcely be possible to dispute the fact that in Hans's mind there was pleasure attached to the excretory functions.

'In the afternoon he ventured into the Stadtpark for the first time. As it is the First of May, no doubt there was less traffic than usual, but still quite enough to have frightened him up to now. He was very proud of his achievement, and after tea I was obliged to go with him to the Stadtpark once again. On the way we met a bus; Hans pointed it out to me, saying: "Look! a stork-box cart!" If he goes with me to the Stadtpark again [98] tomorrow, as we have planned, we shall really be able to regard his illness as cured.

'On May 2 Hans came to me in the morning. "I say," he said, "I thought something today." At first he had forgotten it; but later on he related what follows, though with signs of considerable resistance: "*The plumber came; and first he took away my behind with a pair of pincers, and then gave me another, and then the same with my widdler*. He said: 'Let me see your behind!' and I had to turn round, and he took it away; and then he said: 'Let me see your widdler!'""

Hans's father grasped the nature of this wishful phantasy, and did not hesitate a moment as to the only interpretation it could bear.

'*I*: "He gave you a *bigger* widdler and a *bigger* behind."

'*Hans*: "Yes."

'*I*: "Like Daddy's; because you'd like to be Daddy."

'*Hans*: "Yes, and I'd like to have a moustache like yours and hairs like yours." (He pointed to the hairs on my chest.)

'In the light of this, we may review the interpretation of Hans's earlier phantasy to the effect that the plumber had come and unscrewed the bath and had stuck a borer into his stomach [p. 50 above]. The big bath meant a "behind", the borer or screwdriver was (as was explained at the time) a widdler.[1] The two phantasies are identical. Moreover, a new light [99]

1 Perhaps, too, the word 'borer' ['*Bohrer*'] was not chosen without regard for its connection with 'born' ['*geboren*'] and 'birth' ['*Geburt*']. If so, the child could have made no distinction between 'bored' ['*gebohrt*'] and 'born' ['*geboren*']. I accept this suggestion, made by an experienced fellow worker, but I am not in a position to say whether we have before us here a deep and universal connection between the two ideas or merely the employment of a verbal coincidence peculiar to German [and English]. Prometheus (Pramantha), the creator of man, is also etymologically 'the borer'. (Cf. Abraham, *Traum und Mythus*, 1909.)

is thrown upon Hans's fear of the big bath. (This, by the way, has already diminished.) He dislikes his "behind" being too small for the big bath.'

In the course of the next few days Hans's mother wrote to me more than once to express her joy at the little boy's recovery.

A week later came a postscript from Hans's father.

'My dear Professor, I should like to make the following additions to Hans's case history:

'(1) The remission after he had been given his first piece of enlightenment was not so complete as I may have represented it [p. 23 above]. It is true that Hans went for walks; but only under compulsion and in a state of great anxiety. Once he went with me as far as the Hauptzollamt station, from which our house can still be seen, but could not be induced to go any farther.

'(2) As regards "raspberry syrup" and "a gun for shooting with" [p. 30]. Hans is given raspberry syrup when he is constipated. He also frequently confuses the words "shooting" and "shitting".[1]

'(3) Hans was about four years old when he was moved out of our bedroom into a room of his own.

'(4) A trace of his disorder still persists, though it is no longer in the shape of fear but only in that of the normal drive to ask questions. The questions are mostly concerned with what things are made of (trams, machines, etc.), who makes things, etc. Most of his questions are characterized by the fact that Hans asks them although he has already answered them himself. He only wants to make sure. Once when he had tired me out with his questions and I had said to him: "Do you think I can answer every question you ask?" he replied: "Well, I thought as you knew that about the horse you'd know this too."

[100] '(5) Hans only refers to his illness now as a matter of past history – "at the time when I had my nonsense".

'(6) An unsolved residue remains behind; for Hans keeps cudgelling his brains to discover what a father has to do with his child, since it is the mother who brings it into the world. This can be seen from his questions, as, for instance: "I belong to *you*, too, don't I?" (meaning, not only to his mother). It is not clear to him in what way he belongs to me. On the other hand, I have no direct evidence of his having, as you suppose, overheard his parents in the act of intercourse.

'(7) In presenting the case one ought perhaps to insist upon the violence of his anxiety. Otherwise it might be said that the boy would have

1 [In German '*schiessen*' and '*scheissen*'.]

gone out for walks soon enough if he had been given a sound thrashing.'

In conclusion let me add these words. With Hans's last phantasy the anxiety which arose from his castration complex was also overcome, and his painful expectations were given a happier turn. Yes, the doctor [see p. 7 above] (the plumber) *did* come, he *did* take away his penis – but only to give him a bigger one in exchange for it. For the rest, our young investigator has merely come somewhat early upon the discovery that all knowledge is patchwork, and that each step forward leaves an unsolved residue behind.

III
DISCUSSION[t]

[101] I shall now proceed to examine this observation of the development and resolution of a phobia in a boy under five years of age, and I shall have to do so from three points of view. In the first place I shall consider how far it supports the assertions which I put forward in my *Three Essays on the Theory of Sexuality* (1905*d*). Secondly, I shall consider to what extent it can contribute towards our understanding of this very frequent form of disorder. And thirdly, I shall consider whether it can be made to shed any light upon the mental life of children or to afford any criticism of our educational aims.

(1)

My impression is that the picture of a child's sexual life presented in this observation of Little Hans agrees very well with the account I gave of it (basing my views upon psychoanalytic examinations of adults) in my *Three Essays*. But before going into the details of this agreement I must deal with two objections which will be raised against my making use of the present analysis for this purpose. The first objection is to the effect that Hans was not a normal child, but (as events – the illness itself, in fact – showed) had a predisposition to neurosis, and was a young 'degenerate'; it would be illegitimate, therefore, to apply to other, normal children conclusions which might perhaps be true of him. I shall postpone consideration of this objection, since it only limits the value of the observation, and does not completely nullify it. According to the second and more uncompromising objection, an analysis of a child conducted by his
[102] father, who went to work instilled with *my* theoretical views and infected with *my* prejudices, must be entirely devoid of any objective worth. A child, it will be said, is necessarily highly suggestible, and in regard to no-one, perhaps, more than to his own father; he will allow anything to be forced upon him, out of gratitude to his father for taking so much notice of him; none of his assertions can have any evidential value, and everything he produces in the way of associations, phantasies and dreams will naturally take the direction into which they are being urged by every possible means. Once more, in short, the whole thing is simply 'suggestion' – the only difference being that in the case of a child it can be unmasked much more easily than in that of an adult.

A singular thing. I can remember, when I first began to meddle in the conflict of scientific opinions twenty-two years ago, with what derision the older generation of neurologists and psychiatrists of those days received assertions about suggestion and its effects.[1] Since then the situation has fundamentally changed. The former aversion has been converted into an only too ready acceptance; and this has happened not only as a consequence of the impression which the work of Liébeault and Bernheim and their pupils could not fail to create in the course of these two decades, but also because it has since been discovered how great an economy of thought can be effected by the use of the catchword 'suggestion'. Nobody knows and nobody cares what suggestion is, where it comes from, or when it arises – it is enough that everything awkward in the region of psychology can be labelled 'suggestion'. I do not share the view which is at present fashionable that assertions made by children are invariably arbitrary and untrustworthy. The arbitrary has no existence in mental life. The untrustworthiness of the assertions of children is due to the predominance of their imagination, just as the untrustworthiness of the assertions of grown-up people is due to the [103]
predominance of their prejudices. For the rest, even children do not lie without a reason, and on the whole they are more inclined to a love of truth than are their elders. If we were to reject Little Hans's statements root and branch we should certainly be doing him a grave injustice. On the contrary, we can quite clearly distinguish from one another the occasions on which he was falsifying the facts or keeping them back under the compelling force of a resistance, the occasions on which, being undecided himself, he agreed with his father (so that what he said must not be taken as evidence), and the occasions on which, freed from every pressure, he burst into a flood of information about what was really going on inside him and about things which until then no-one but himself had known. Statements made by adults offer no greater certainty. It is a regrettable fact that no account of a psychoanalysis can reproduce the impressions received by the analyst as he conducts it, and that a final sense of conviction can never be obtained from reading about it but only from directly experiencing it. But this disability attaches in an equal degree to analyses of adults.

Little Hans is described by his parents as a cheerful, straightforward child, and so he should have been, considering the education [*Erziehung*][T] given him by his parents, which consisted essentially in the omission of our usual educational sins. So long as he was able to carry on

1 [Cf. the similar remarks at the end of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 408.]

his researches in a state of happy naivety, without a suspicion of the conflicts which were soon to arise out of them, he kept nothing back; and the observations made during the period before the phobia admit of no doubt or demur. It was with the outbreak of the illness and during the analysis that discrepancies began to make their appearance between what he said and what he thought; and this was partly because unconscious material, which he was unable to master all at once, was forcing itself upon him, and partly because the content of his thoughts provoked
[104] reservations on account of his relation to his parents. It is my unbiased opinion that these difficulties, too, turned out no greater than in many analyses of adults.

It is true that during the analysis Hans had to be told many things that he could not say himself, that he had to be presented with thoughts which he had so far shown no signs of possessing, and that his attention had to be turned in the direction from which his father was expecting something to come. This detracts from the evidential value of the analysis; but the procedure is the same in every case. For a psychoanalysis is not an impartial scientific investigation, but a therapeutic measure. Its essence is not to prove anything, but merely to alter something. In a psychoanalysis the physician always gives his patient (sometimes to a greater and sometimes to a lesser extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it. Slight disorders may perhaps be brought to an end by the subject's unaided efforts, but never a neurosis – a thing which has set itself up against the ego as an element alien to it. To get the better of such an element another person must be brought in, and insofar as that other person can be of assistance the neurosis will be curable. If it is in the very nature of any neurosis to turn away from the 'other person' – and this seems to be one of the characteristics of the states grouped together under the name of dementia praecox – then for that very reason such a state will be incurable by any efforts of ours. It is true that a child, on account of the small development of his intellectual systems, requires especially energetic assistance. But, after all, the information which the physician gives his patient is itself derived in its turn from analytical experience; and indeed it is sufficiently convincing if, at the cost of this intervention by the physician, we are
[105] enabled to discover the structure of the pathogenic material and simultaneously to dissipate it.

And yet, even during the analysis, the small patient gave evidence of enough independence to acquit him upon the charge of 'suggestion'. Like all other children, he applied his childish sexual theories to the material before him without having received any encouragement to do so. These theories are extremely remote from the adult mind. Indeed, in this instance I actually omitted to warn Hans's father that the boy would be bound to approach the subject of childbirth by way of the excretory complex. This negligence on my part, though it led to an obscure phase in the analysis, was nevertheless the means of producing a good piece of evidence of the genuineness and independence of Hans's mental processes. He suddenly became occupied with 'lumf' [p. 42 ff. above], without his father, who is supposed to have been practising suggestion upon him, having the least idea how he had arrived at that subject or what was going to come of it. Nor can his father be saddled with any responsibility for the production of the two plumber phantasies [pp. 50 and 75], which arose out of Hans's early acquired 'castration complex'. And I must here confess that, out of theoretical interest, I entirely concealed from Hans's father my expectation that there would turn out to be some such connection, so as not to interfere with the value of a piece of evidence such as does not often come within one's grasp.

If I went more deeply into the details of the analysis I could produce plenty more evidence of Hans's independence of 'suggestion'; but I shall break off the discussion of this preliminary objection at this point. I am aware that even with this analysis I shall not succeed in convincing anyone who will not let himself be convinced, and I shall proceed with my discussion of the case for the benefit of those readers who are already convinced of the objective reality of unconscious pathogenic material. And I do this with the agreeable assurance that the number of such readers is steadily increasing. [106]

The first trait in Little Hans which can be regarded as part of his sexual life was a quite peculiarly lively interest in his 'widdler' – an organ deriving its name from that one of its two functions which, scarcely the less important of the two, is not to be eluded in the nursery. This interest aroused in him the spirit of enquiry, and he thus discovered that the presence or absence of a widdler made it possible to differentiate between animate and inanimate objects [p. 8 above]. He assumed that all animate objects were like himself, and possessed this important bodily organ; he observed that it was present in the larger animals, suspected that this was so too in both his parents, and was not deterred by the evidence of his

own eyes from authenticating the fact in his newborn sister [pp. 9–10 above]. One might almost say that it would have been too shattering a blow to his '*Weltanschauung*' if he had had to make up his mind to forgo the presence of this organ in a being similar to him; it would have been as though it were being torn away from himself. It was probably on this account that a threat of his mother's [p. 7], which was concerned precisely with the loss of his widdler, was hastily dismissed from his thoughts and only succeeded in making its effects apparent at a later period. The reason for his mother's intervention had been that he used to like giving himself feelings of pleasure by touching his member: the little boy had begun to practise the commonest – and most normal – form of auto-erotic sexual activity.

The pleasure which a person takes in his own sexual organ may become associated with scopophilia [*Schaulust*][T] in its active and passive forms, in a manner which has been very aptly described by Alfred Adler (1908) as 'confluence of drives' ['*Triebverschränkung*'][T]. So Little Hans began to try to get a sight of other people's widdlers; his sexual curiosity
[107] developed, and at the same time he liked to exhibit his own widdler. One of his dreams, dating from the beginning of his period of repression, expressed a wish that one of his little girl friends should assist him in widdling, that is, that she should share the spectacle [p. 16]. The dream shows, therefore, that up till then this wish had subsisted unrepressed, and later information confirmed the fact that he had been in the habit of gratifying it. The active side of his sexual scopophilia soon became associated in him with a definite theme. He repeatedly expressed both to his father and his mother his regret that he had never yet seen their widdlers; and it was probably the need *for making a comparison* which impelled him to do this. The ego is always the standard by which one measures the external world; one learns to understand it by means of a constant comparison with oneself. Hans had observed that large animals had widdlers that were correspondingly larger than his; he consequently suspected that the same was true of his parents, and was anxious to make sure of this. His mother, he thought, must certainly have a widdler 'like a horse'. He was then prepared with the comforting reflection that his widdler would grow with him. It was as though the child's wish to be bigger had been concentrated on his genitals.

Thus in Little Hans's sexual constitution the genital zone was from the outset the one among his erotogenic zones which afforded him the most intense pleasure. The only other similar pleasure of which he gave evidence was excretory pleasure, the pleasure attached to the orifices

through which micturition and evacuation of the bowels are effected. In his final phantasy of bliss, with which his illness was overcome, he imagined he had children, whom he took to the WC, whom he made to widdle, whose behinds he wiped – for whom, in short, he did 'everything one does with children' [p. 75 above]; it therefore seems impossible to avoid the assumption that during the period when he himself had been looked after as an infant these same performances had been the source of [108]
pleasurable sensations for him. He had obtained this pleasure from his erotogenic zones with the help of the person who had looked after him – his mother, in fact; and thus the pleasure already pointed the way to object choice. But it is just possible that at a still earlier date he had been in the habit of giving himself this pleasure auto-erotically – that he had been one of those children who like retaining their excreta till they can derive a voluptuous sensation from their evacuation. I say no more than that it is possible, because the matter was not cleared up in the analysis; the 'making a row with the legs' (kicking about), of which he was so much frightened later on, points in that direction. But in any case these sources of pleasure had no particularly striking importance with Hans, as they so often have with other children. He early became clean in his habits, and neither bedwetting nor diurnal incontinence played any part during his first years; no trace was observed in him of any inclination to play with his excrement, a propensity which is so revolting in adults, and which commonly makes its reappearance at the termination of processes of psychical involution.

At this juncture it is as well to emphasize at once the fact that during his phobia there was an unmistakable repression of these two well-developed components of his sexual activity. He was ashamed of micturating before other people, accused himself of putting his finger to his widdler, made efforts to give up masturbating, and showed disgust at 'lumf' and 'widdle' and everything that reminded him of them. In his phantasy of looking after his children he undid this latter repression.

A sexual constitution like that of Little Hans does not appear to carry with it a predisposition to the development either of perversions or of their negative (we will limit ourselves to a consideration of hysteria).[1] As far as my experience goes (and there is still a real need for speaking [109]
with caution on this point) the innate constitution of hysterics – that this is also true of perverts is almost self-evident – is marked by the genital zone being relatively less prominent than the other erotogenic zones.

1 [See the paragraphs on 'Neurosis and Perversion' in Section 4 of the first of Freud's *Three Essays* (1905*d*), *RSE*, **7**, 147.]

But we must expressly except from this rule one particular 'aberration' of sexual life. In those who later become homosexuals we meet with the same predominance in infancy of the genital zone (and especially of the penis) as in normal persons.[1] Indeed it is the high esteem felt by the homosexual for the male organ which decides his fate. In his childhood he chooses women as his sexual object, so long as he assumes that they too possess what in his eyes is an indispensable part of the body; when he becomes convinced that women have deceived him in this particular, they cease to be acceptable to him as a sexual object. He cannot forgo a penis in anyone who is to attract him to sexual intercourse; and if circumstances are favourable he will fix his libido upon the 'woman with a penis', a youth of feminine appearance. Homosexuals, then, are persons who, owing to the erotogenic importance of their own genitals, cannot do without a similar feature in their sexual object. In the course of their development from auto-erotism to object love, they have remained fixated at a point between the two – a point which is closer to auto-erotism.[2]

There is absolutely no justification for distinguishing a special homosexual drive. What constitutes a homosexual is a peculiarity not in his
[110] drive activity but in his choice of an object. Let me recall what I have said in my *Three Essays* to the effect that we have mistakenly imagined the bond between drive and object in sexual life as being more intimate than it really is.[3] A homosexual may have normal drives, but he is unable to disengage them from a class of objects defined by a particular determinant. And in his childhood, since at that period this determinant is taken for granted as being of universal application, he is able to behave like Little Hans, who showed his affection to little boys and girls indiscriminately, and once described his friend Fritzl as 'the girl he was fondest of' [p. 13 above]. Hans was a homosexual (as all children may very well be), quite consistently with the fact, which must always be kept in mind, that

1 As my expectations led me to suppose, and as Sadger's observations [e.g. 1908*a* and 1909*a*] have shown, all such people pass through an amphigenic phase in childhood.

2 [The 'woman with a penis' had been previously mentioned in Freud's paper on 'The Sexual Theories of Children' (1908*c*), *RSE*, **9**, 188 f. For a summary of his views on male homosexuality see the paragraph on the 'Sexual Object of Inverts' in Section 1 (A) of the first of the *Three Essays* (1905*d*), and especially the long footnote added in the course of the successive editions of that book (ibid., **7**, 129–31).]

3 [Freud, 1905*d*; ibid., **7**, 132.]

he was acquainted with only one kind of genital organ – a genital organ like his own.[1]

In his subsequent development, however, it was not to homosexuality that our young libertine proceeded, but to an energetic masculinity with traits of polygamy; he knew how to vary his behaviour, too, with his varying feminine objects – audaciously aggressive in one case, languishing and bashful in another. His affection had moved from his mother on to other objects of love, but at a time when there was a scarcity of these it returned to her, only to break down in a neurosis. It was not until this happened that it became evident to what a pitch of intensity his love for his mother had developed and through what vicissitudes it had passed. The sexual aim which he pursued with his girl playmates, of *sleeping* with them, had originated in relation to his mother. It was expressed in words which might be retained in maturity, though they would then bear [111]
a richer connotation.[2] The boy had found his way to object love in the usual manner from the care he had received when he was an infant; and a new pleasure had now become the most important for him – that of sleeping beside his mother. I should like to emphasize the importance of pleasure derived from cutaneous contact as a component in this new aim of Hans's, which, according to the nomenclature (artificial to my mind) of Moll, would have to be described as satisfaction of the drive to contrectation. [Moll (1898). Cf. *RSE*, **7**, 151 *n*.]

In his attitude towards his father and mother Hans confirms in the most concrete and uncompromising manner what I have said in my *Interpretation of Dreams* [1900*a*, in Section D (*β*) of Chapter V; ibid., **4**, 220 ff.] and in my *Three Essays* [1905*d*; ibid., **7**, 196 ff.] with regard to the sexual relations of a child to his parents. Hans really was a little Oedipus who wanted to have his father 'out of the way', to get rid of him, so that he might be alone with his beautiful mother and sleep with her. This wish had originated during his summer holidays, when the alternating presence and absence of his father had drawn Hans's attention to the condition upon which depended the intimacy with his mother which he longed for. At that time the form taken by the wish had been merely that his father should 'go away'; and at a later stage it became possible for his

1 [*Footnote added* 1923:] I have subsequently (1923*e*) drawn attention to the fact that the period of sexual development which our little patient was passing through is universally characterized by acquaintance with only *one* sort of genital organ, namely, the male one. In contrast to the later period of maturity, this period is marked not by a *genital* primacy but by a primacy of the *phallus*.

2 [The German '*bei jemandem schlafen*' is used, like the English 'to sleep with someone' (or the equivalent 'to lie with'), in the sense of 'to copulate with'.]

fear of being bitten by a white horse to attach itself directly on to this form of the wish, owing to a chance impression which he received at the
[112] moment of someone else's departure.[1] But subsequently (probably not until they had moved back to Vienna, where his father's absences were no longer to be reckoned on) the wish had taken the form that his father should be *permanently* away – that he should be 'dead'. The fear [*Angst*] which sprang from this death wish against his father, and which may thus be said to have had a normal motive, formed the chief obstacle to the analysis until it was removed during the conversation in my consulting room [pp. 32–3 above].[2]

But Hans was not by any means a bad character; he was not even one of those children who at his age still give free play to the propensity towards cruelty and violence which is a constituent of human nature. On the contrary, he had an unusually kindhearted and affectionate disposition; his father reported that the transformation of aggressive tendencies into feelings of pity took place in him at a very early age. Long before the phobia he had become uneasy when he saw the horses in a merry-go-round being beaten; and he was never unmoved if anyone wept in his presence. At one stage in the analysis a piece of suppressed sadism made its appearance in a particular context:[3] but it was *suppressed* sadism, and we shall presently have to discover from the context what it stood for and what it was meant to replace. And Hans deeply loved the father against whom he cherished these death wishes; and while his intellect demurred to such a contradiction,[4] he could not help demonstrating the fact of its existence, by hitting his father and immediately afterwards
[113] kissing the place he had hit [p. 33 *n.* above]. We ourselves, too, must guard against making a difficulty of such a contradiction. The emotional life of man is in general made up of pairs of contraries such as these.[5]

1 [In the editions before 1924 this read 'at the moment of the departure of another father'. The original account of the episode on p. 23 above (as also the reference to it on p. 35) seemed, however, to imply that it was only Lizzi who was going away. Hence the correction and the similar one on p. 91 below.]

2 It is quite certain that Hans's two associations, 'raspberry syrup' and 'a gun for shooting people dead with' [p. 30 above], must have had more than one set of determinants. They probably had just as much to do with his hatred of his father as with his constipation complex. His father, who himself guessed the latter connection [p. 76], also suggested that 'raspberry syrup' might be related to 'blood'.

3 His wanting to beat and tease horses [p. 61].

4 See the critical question he addressed to his father (p. 34).

5 Das heisst, ich bin kein ausgeklügelt Buch.
Ich bin ein Mensch mit seinem Widerspruch.
C. F. MEYER, *Huttens letzte Tage*, [xxvi, 'Homo Sum'].
[In fact, I am no clever work of fiction;
I am a man, with all his contradiction.
The same lines are quoted in a letter to Fliess of February 19, 1899 (Freud, 1950*a*, Letter 105).]

Indeed, if it were not so, repressions and neuroses would perhaps never come about. In the adult these pairs of contrary emotions do not as a rule become simultaneously conscious except at the climaxes of passionate love; at other times they usually go on suppressing each other until one of them succeeds in keeping the other altogether out of sight. But in children they can exist peaceably side by side for quite a considerable time.

The most important influence upon the course of Hans's psychosexual development was the birth of a baby sister when he was three and a half years old. That event accentuated his relations to his parents and gave him some insoluble problems to think about; and later, as he watched the way in which the infant was looked after, the memory traces of his own earliest experiences of pleasure were revived in him. This influence, too, is a typical one: in an unexpectedly large number of life histories, normal as well as pathological, we find ourselves obliged to take as our starting point an outburst of sexual pleasure and sexual curiosity connected, like this one, with the birth of the next child. Hans's behaviour towards the new arrival was just what I have described in *The Interpretation of Dreams* [1900*a*, in Section D (*β*) of Chapter V; *RSE*, **4**, 222 f.]. In his fever a few days later he betrayed how little he liked the addition to the family [p. 9 above]. Affection for his sister might come later,[1] but his first attitude was hostility. From that time forward fear that yet another [114]
baby might arrive found a place among his conscious thoughts. In the neurosis, his hostility, already suppressed, was represented by a special fear – a fear of the bath [p. 51]. In the analysis he gave undisguised expression to his death wish against his sister, and was not content with allusions which required supplementing by his father. His inner conscience did not consider this wish so wicked as the analogous one against his father; but it is clear that in his unconscious he treated both persons in the same way, because they both took his mummy away from him, and interfered with his being alone with her.

Moreover, this event and the feelings that were revived by it gave a new direction to his wishes. In his triumphant final phantasy [p. 74] he summed up all of his erotic wishes, both those derived from his autoerotic phase and those connected with his object love. In that phantasy he was married to his beautiful mother and had innumerable children whom he could look after in his own way.

1 Cf. his plans of what he would do when his sister was old enough to speak (p. 56).

(II)

One day while Hans was in the street he was seized with an attack of anxiety. He could not yet say what it was he was afraid of; but at the very beginning of this anxiety state he betrayed to his father his motive for being ill, the gain from illness.[1] He wanted to stay with his mother and to coax with her; his recollection that he had also been separated from her at the time of the baby's birth may also, as his father suggests [p. 74 above], have contributed to his longing. It soon became evident that his anxiety was no longer reconvertible into longing; he was afraid even when his mother went with him. In the meantime indications appeared
[115] of what it was to which his libido (now changed into anxiety) had become attached. He gave expression to the quite specific fear that a white horse would bite him.

Disorders of this kind are called 'phobias', and we might classify Hans's case as an agoraphobia if it were not for the fact that it is a characteristic of that complaint that the locomotion of which the patient is otherwise incapable can always be easily performed when he is accompanied by some specially selected person – in the last resort, by the physician. Hans's phobia did not fulfil this condition; it soon ceased having any relation to the question of locomotion and became more and more clearly concentrated upon horses. In the early days of his illness, when the anxiety was at its highest pitch, he expressed a fear that 'the horse'll come into the room' [p. 19], and it was this that helped me so much towards understanding his condition.

In the classificatory system of the neuroses no definite position has hitherto been assigned to 'phobias'. It seems certain that they should only be regarded as syndromes which may form part of various neuroses and that we need not rank them as an independent pathological process. For phobias of the kind to which Little Hans's belongs, and which are in fact the most common, the name of 'anxiety hysteria' seems to me not inappropriate; I suggested the term to Dr W. Stekel when he was undertaking a description of neurotic anxiety states,[2] and I hope it will come into general use. It finds its justification in the similarity between the psychological structure of these phobias and that of hysteria – a similarity which is complete except upon a single point. That point, however,

1 [A full discussion of the advantages derived from being ill can be found in Lecture XXIV of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 338–9.]

2 *Nervöse Angstzustände und ihre Behandlung*, 1908. [Freud wrote a Preface to the first edition of this work (1908*f*), *RSE*, **9**, 221 f.]

is a decisive one and well adapted for purposes of differentiation. For in anxiety hysteria the libido which has been liberated from the pathogenic material by repression is not *converted* (that is, diverted from the mental sphere into a somatic innervation), but is set free in the shape of *anxiety*. In the clinical cases that we meet with, this 'anxiety hysteria' may be [116] combined with 'conversion hysteria' in any proportion. There exist cases of pure conversion hysteria without any trace of anxiety, just as there are cases of simple anxiety hysteria, which exhibit feelings of anxiety and phobias, but have no admixture of conversion. The case of Little Hans is one of the latter sort.

Anxiety hysterias are the most common of all psychoneurotic disorders. But, above all, they are those which make their appearance earliest in life; they are *par excellence* the neuroses of childhood. When a mother uses such phrases as that her child's 'nerves' are in a bad state, we can be certain that in nine cases out of ten the child is suffering from some kind of anxiety or from many kinds at once. Unfortunately the finer mechanism of these highly significant disorders has not yet been sufficiently studied. It has not yet been established whether anxiety hysteria is determined, in contradistinction to conversion hysteria and other neuroses, solely[1] by constitutional factors or solely by accidental experiences, or by what combination of the two.[2] It seems to me that of all neurotic disorders it is the least dependent upon a special constitutional disposition and that it is consequently the most easily acquired at any time of life.

One essential characteristic of anxiety hysterias is very easily pointed out. An anxiety hysteria tends to develop more and more into a 'phobia'. In the end the patient may have got rid of all his anxiety, but only at the [117] price of subjecting himself to all kinds of inhibitions [*Hemmungen*][T] and restrictions. From the outset in anxiety hysteria the mind is constantly at work in the direction of once more psychically binding the anxiety which has become liberated; but this work can neither bring about a retransformation of the anxiety into libido, nor can it establish any contact with the complexes which were the source of the libido. Nothing is left for it but to cut off access to every possible occasion that might lead

1 [This word was added in 1924, no doubt in order to clarify the sentence.]

2 [*Footnote added* 1923:] The question which is raised here has not been pursued further. But there is no reason to suppose that anxiety hysteria is an exception to the rule that both disposition and experience must cooperate in the aetiology of a neurosis. Rank's view of the effects of the trauma of birth seems to throw special light upon the disposition to anxiety hysteria which is so strong in childhood. [See, however, Freud's later criticism of this view of Rank's in the eighth chapter of *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 120 ff.]

to the development of anxiety, by erecting mental barriers in the nature of precautions, inhibitions or prohibitions; and it is these protective structures that appear to us in the form of phobias and that constitute to our eyes the essence of the disease.

The treatment of anxiety hysteria may be said hitherto to have been a purely negative one. Experience has shown that it is impossible to effect the cure of a phobia (and even in certain circumstances dangerous to attempt to do so) by violent means, that is, by first depriving the patient of his defences and then putting him in a situation in which he cannot escape the liberation of his anxiety. Consequently, nothing can be done but to leave the patient to look for protection wherever he thinks he may find it; and he is merely regarded with a not very helpful contempt for his 'incomprehensible cowardice'.

Little Hans's parents were determined from the very beginning of his illness that he was to be neither laughed at nor bullied, but that access must be obtained to his repressed wishes by means of psychoanalysis. The extraordinary pains taken by Hans's father were rewarded by success, and his reports will give us an opportunity of penetrating into the fabric of this type of phobia and of following the course of its analysis.

I think it is not unlikely that the extensive and detailed character of the
[118] analysis may have made it somewhat obscure to the reader. I shall therefore begin by giving a brief résumé of it, in which I shall omit all distracting side-issues and shall draw attention to the results as they came to light one after the other.

The first thing we learn is that the outbreak of the anxiety state was by no means so sudden as appeared at first sight. A few days earlier the child had woken from an anxiety dream to the effect that his mother had gone away, and that now he had no mother to coax with [p. 18 above]. This dream alone points to the presence of a repressive process of ominous intensity. We cannot explain it, as we can so many other anxiety dreams, by supposing that the child had in his dream felt anxiety arising from some somatic cause and had made use of the anxiety for the purpose of fulfilling an unconscious wish which would otherwise have been deeply repressed.[1] We must regard it rather as a genuine punishment and repression dream, and, moreover, as a dream which failed in its function, since the child woke from his sleep in a state of anxiety. We can easily reconstruct what actually occurred in the unconscious. The child dreamt of exchanging endearments with his mother and of sleeping with her; but

1 See my *Interpretation of Dreams* [1900*a*; *RSE*, **4**, 209 f.].

all the pleasure was transformed into anxiety, and all the ideational content into its opposite. Repression had defeated the purpose of the mechanism of dreaming.

But the beginnings of this psychological situation go back further still. During the preceding summer Hans had had similar moods of mingled longing and apprehension, in which he had said similar things; and at that time they had secured him the advantage of being taken by his mother into her bed. We may assume that since then Hans had been in a state of intensified sexual excitement, the object of which was his mother. The intensity of this excitement [*Erregung*]^{T} was shown by his two attempts [pp. 15 and 19 above] at seducing his mother (the second of which occurred just before the outbreak of his anxiety); and he found [119]
an incidental channel of discharge [*entlädt*]^{T} for it by masturbating every *entladen*
evening and in that way obtaining gratification. Whether the sudden changeover of this excitement into anxiety took place spontaneously, or as a result of his mother's rejection of his advances, or owing to the accidental revival of earlier impressions by the 'precipitating cause' of his illness (about which we shall hear presently) – this we cannot decide; and, indeed, it is a matter of indifference, for these three alternative possibilities cannot be regarded as mutually incompatible. The fact remains that his sexual excitement suddenly changed into anxiety.

We have already described the child's behaviour at the beginning of his anxiety, as well as the first content which he assigned to it, namely, that a *horse* would bite him. It was at this point that the first piece of therapy was interposed. His parents represented to him that his anxiety was the result of masturbation, and encouraged him to break himself of the habit [p. 19]. I took care that when they spoke to him great stress was laid upon his affection for his mother, for that was what he was trying to replace with his fear of horses [p. 22]. This first intervention brought a slight improvement, but the ground was soon lost again during a period of physical illness. Hans's condition remained unchanged. Soon afterwards he traced back his fear of being bitten by a horse to an impression he had received at Gmunden [p. 23]. A father had addressed his child on her departure[1] with these words of warning: 'Don't put your finger to the horse; if you do, it'll bite you.' The words 'don't put your finger to', which Hans used in reporting this warning, resembled the form of words in which the warning against masturbation had been framed. It seemed at first, therefore, as though Hans's parents were right in supposing that

1 [Before 1924 this read: 'A father, on his departure, had addressed his child . . .' See footnote 1, p. 86 above.]

what he was frightened of was his own masturbatory indulgence. But the
[120] whole nexus remained loose, and it seemed to be merely by chance that horses had become his bugbear.

I had expressed a suspicion that Hans's repressed wish might now be that he wanted at all costs to see his mother's widdler. As his behaviour to a new maid fitted in with this hypothesis, his father gave him his first piece of enlightenment, namely, that women have no widdlers [p. 25 above]. He reacted to this first effort at helping him by producing a phantasy that he had seen his mother showing her widdler.[1] This phantasy and a remark made by him in conversation, to the effect that his widdler was 'fixed in, of course', allow us our first glimpse into the patient's unconscious mental processes. The fact was that the threat of castration made to him by his mother some fifteen months earlier [p. 7] was now having a deferred [*nachträglichen*] effect upon him. For his phantasy that his mother was doing the same as he had done (the familiar *tu quoque* repartee of inculpated children) was intended to serve as a piece of self-justification; it was a protective or defensive phantasy
Abwehr [*Abwehrphantasie*][T]. At the same time we must remark that it was Hans's parents who had extracted from the pathogenic material operating in him the particular theme of his interest in widdlers. Hans followed their lead in this matter, but he had not yet taken any line of his own in the analysis. And no therapeutic success was to be observed. The analysis had passed far away from the subject of horses; and the information that women have no widdlers was calculated, if anything, to increase his concern for the preservation of his own.

Therapeutic success, however, is not our primary aim; we endeavour rather to enable the patient to obtain a conscious grasp of his unconscious wishes. And this we can achieve by working upon the basis of the
[121] hints he throws out, and so, with the help of our interpretative technique, presenting the unconscious complex to his consciousness *in our own words*. There will be a certain degree of similarity between that which he hears from us and that which he is looking for, and which, in spite of all resistances, is trying to force its way through to consciousness; and it is this similarity that will enable him to discover the unconscious material. The physician is a step in front of him in knowledge; and the patient follows along his own road, until the two meet at the appointed goal. Beginners in psychoanalysis are apt to assimilate these two events,

1 The context enables us to add: 'and touching it' (p. 25). After all, he himself could not show his widdler without touching it. [This footnote was added in 1924. Previously the word 'touching' appeared in the text instead of 'showing'.]

and to suppose that the moment at which one of the patient's unconscious complexes has become known to *them* is also the moment at which the patient himself recognizes it. They are expecting too much when they think that they will cure the patient by informing him of this piece of knowledge; for he can do no more with the information than make use of it to help himself in discovering the unconscious complex *where it is anchored* in his unconscious.[1] A first success of this sort had now been achieved with Hans. Having partly mastered his castration complex, he was now able to communicate his wishes in regard to his mother. He did so, in what was still a distorted form, by means of the *phantasy of the two giraffes*, one of which was calling out in vain because Hans had taken possession of the other [p. 29 above]. He represented the 'taking possession of' pictorially as 'sitting down on'. His father recognized the phantasy as a reproduction of a bedroom scene which used to take place in the morning between the boy and his parents; and he quickly stripped the underlying wish of the disguise which it still wore. The boy's father and mother were the two giraffes. The reason for the choice of a giraffe phantasy for the purposes of disguise was fully [122] explained by a visit that the boy had paid to those same large beasts at Schönbrunn a few days earlier, by the giraffe drawing, belonging to an earlier period, which had been preserved by his father, and also, perhaps, by an unconscious comparison based upon the giraffe's long, stiff neck.[2] It may be remarked that the giraffe, as being a large animal and interesting on account of its widdler, was a possible competitor with the horse for the role of bugbear; moreover, the fact that both his father and his mother appeared as giraffes offered a hint which had not yet been followed up, as regards the interpretation of the anxiety horses.

Immediately after the giraffe story Hans produced two minor phantasies: one of his forcing his way into a forbidden space at Schönbrunn, and the other of his smashing a railway-carriage window on the Stadtbahn [pp. 31–2 above]. In each case the punishable nature of the action was emphasized, and in each his father appeared as an accomplice. Unluckily his father failed to interpret either of these phantasies, so that Hans himself gained nothing from telling them. In an analysis, however, a thing which has not been understood inevitably reappears; like an

1 [The point made here was discussed by Freud at greater length in the last pages of his technical paper 'On Beginning the Treatment' (1913*c*), *RSE*, **12**, 137–8, and more briefly in his paper on 'wild' analysis (1910*k*), ibid., **11**, 216 f. See also Section II of 'The Unconscious' (1915*e*), ibid., **14**, 155 ff.]

2 Hans's admiration of his father's neck later on would fit in with this. [This is probably a condensation of the episodes on pp. 31 and 41 above.]

unlaid ghost, it cannot rest until the mystery has been solved and the spell broken.

There are no difficulties in the way of our understanding these two criminal phantasies. They belonged to Hans's complex of taking possession of his mother. Some kind of vague notion was struggling in the child's mind of something that he might do with his mother by means of which his taking possession of her would be consummated; for this elusive thought he found certain pictorial representations, which had in common the qualities of being violent and forbidden, and the content of
[123] which strikes us as fitting in most remarkably well with the hidden truth. We can only say that they were symbolic phantasies of intercourse, and it was no irrelevant detail that his father was represented as sharing in his actions: 'I should like', he seems to have been saying, 'to be doing something with my mother, something forbidden; I do not know what it is, but I do know that you are doing it too.'

The giraffe phantasy strengthened a conviction which had already begun to form in my mind when Hans expressed his fear that 'the horse'll come into the room' [p. 19 above]; and I thought the right moment had now arrived for informing him that he was afraid of his father because he himself nourished jealous and hostile wishes against him – for it was essential to postulate this much with regard to his unconscious impulses. In telling him this, I had partly interpreted his fear of horses for him: the horse must be his father – whom he had good internal reasons for fearing. Certain details of which Hans had shown he was afraid, the black on horses' mouths and the things in front of their eyes (the moustaches and eyeglasses which are the privilege of a grown-up man), seemed to me to have been directly transposed from his father on to the horses [pp. 32–3].

By enlightening Hans on this subject I had cleared away his most powerful resistance against allowing his unconscious thoughts to be made conscious; for his father was himself acting as his physician. The worst of the attack was now over; there was a plentiful flow of material; the little patient summoned up courage to describe the details of his phobia, and soon began to take an active share in the conduct of the analysis.[1]

1 Even in analyses in which the physician and the patient are strangers, fear of the father plays one of the most important parts as a resistance against the reproduction of the unconscious pathogenic material. Resistances are sometimes in the nature of [stereotyped] 'motifs'. But sometimes, as in the present instance, one piece of the unconscious material is capable from its actual *content* of operating as an inhibition against the reproduction of another piece. [These last two sentences struck the translators as obscure, and, on Freud's instructions, they were

It was only then that we learnt what the objects and impressions were [124]
of which Hans was afraid. He was afraid not only of horses biting him – he was soon silent upon that point – but also of carts, of furniture vans and of buses (their common quality being, as presently became clear, that they were all heavily loaded), of horses that started moving, of horses that looked big and heavy, and of horses that drove quickly. The meaning of these specifications was explained by Hans himself: he was afraid of horses *falling down*, and consequently incorporated in his phobia everything that seemed likely to facilitate their falling down [p. 36 above].

It not at all infrequently happens that it is only after doing a certain amount of psychoanalytic work with a patient that an analyst can succeed in learning the actual content of a phobia, the precise form of words of an obsessional impulse [*eines Zwangsimpulses*][T], and so on. Repression *Zwang*
has not only descended upon the unconscious complexes, but it is continually attacking their derivatives as well, and even prevents the patient from becoming aware of the products of the disease itself. The analyst thus finds himself in the position, curious for a doctor, of coming to the help of a disease, and of procuring it its due of attention.[1] But only those who entirely misunderstand the nature of psychoanalysis will lay stress upon this phase of the work and suppose that on its account harm is likely to be done by analysis. The fact is that you must catch your thief before you can hang him, and that it requires some expenditure of labour to get securely hold of the pathological structures at the destruction of which the treatment is aimed.

I have already remarked in the course of my running commentary on [125]
the case history [p. 40] that it is most instructive to plunge in this way into the details of a phobia, and thus arrive at a conviction of the secondary nature of the relation between the anxiety and its objects. It is this that accounts for phobias being at once so curiously diffuse and so strictly conditioned.[2] It is evident that the material for the particular disguises which Hans's fear adopted was collected from the impressions to which he was all day long exposed owing to the Head Customs House being situated on the opposite side of the street. In this connection, too, he showed signs of an impulse – though it was now inhibited by his

omitted from the English translation in 1925. The issue involved in this footnote seems to be analogous to the question of the innateness of 'primal phantasies'. See pp. 7–8 *n.* 3 above and 158 f. *n.* below.]

1 [Similarly with obsessional neuroses. See the case of the 'Rat Man', below, p. 169.]

2 [This point is elaborated by Freud in a discussion of 'systems' in his *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 92–3.]

anxiety – to play with the loads on the carts, with the packages, casks and boxes, like the street boys.

It was at this stage of the analysis that he recalled the event, insignificant in itself, which immediately preceded the outbreak of the illness and may no doubt be regarded as the precipitating cause of its outbreak. He went for a walk with his mother, and saw a bus-horse fall down and kick about with its feet [p. 38 f. above]. This made a great impression on him. He was terrified, and thought the horse was dead; and from that time on he thought that all horses would fall down. His father pointed out to him that when he saw the horse fall down he must have thought of him, his father, and have wished that he might fall down in the same way and be dead. Hans did not dispute this interpretation; and a little while later he played a game consisting of biting his father, and so showed that he accepted the theory of his having identified his father with the horse he was afraid of [p. 40]. From that time forward his behaviour to his father was unconstrained and fearless, and, in fact, a trifle overbearing. Nevertheless, his fear of horses persisted; nor was it yet clear through what chain of associations the horse's falling down had stirred up his unconscious wishes.

[126] Let me summarize the results that had so far been reached. Behind the fear to which Hans first gave expression, the fear of a horse biting him, we had discovered a more deeply seated fear, the fear of horses falling down; and both kinds of horses, the biting horse and the falling horse, had been shown to represent his father, who was going to punish him for the evil wishes he was nourishing against him. Meanwhile the analysis had moved away from the subject of his mother.

Quite unexpectedly, and certainly without any prompting from his father, Hans now began to be occupied with the 'lumf' complex, and to show disgust at things that reminded him of evacuating his bowels [p. 43]. His father, who was reluctant to go with him along that line, pushed on with the analysis through thick and thin in the direction in which he wanted to go. He elicited from Hans the recollection of an event at Gmunden, the impression of which lay concealed behind that of the falling bus-horse. While they were playing at horses, Fritzl, the playmate of whom he was so fond, but at the same time, perhaps, his rival with his many girl friends, had hit his foot against a stone and had fallen down, and his foot had bled [p. 45]. Seeing the bus-horse fall had reminded him of this accident. It deserves to be noticed that Hans, who was at the moment concerned with other things, began by denying that Fritzl had fallen down (though this was the event which formed the

connection between the two scenes) and admitted it only at a later stage of the analysis [p. 63 above]. It is especially interesting, however, to observe the way in which the transformation of Hans's libido into anxiety was projected on to the principal object of his phobia, on to horses. Horses interested him the most of all the large animals; playing at horses was his favourite game with the other children. I had a suspicion – and this was confirmed by Hans's father when I asked him – that the first person who had served Hans as a horse must have been his father; and it was this [127] that had enabled him to regard Fritzl as a substitute for his father when the accident happened at Gmunden. When repression had set in and brought a revulsion of feeling along with it, horses, which had till then been associated with so much pleasure, were necessarily turned into objects of fear.

But, as we have already said, it was owing to the intervention of Hans's father that this last important discovery was made of the way in which the precipitating cause of the illness had operated. Hans himself was occupied with his lumf interests, and thither at last we must follow him. We learn that formerly Hans had been in the habit of insisting upon accompanying his mother to the WC [p. 49], and that he had revived this custom with his friend Berta at a time when she was filling his mother's place, until the fact became known and he was forbidden to do so [p. 47]. Pleasure taken in looking on while someone one loves performs the natural functions is once more a 'confluence of drives', of which we have already noticed an instance in Hans [p. 82]. In the end his father went into the lumf symbolism, and recognized that there was an analogy between a heavily loaded cart and a body loaded with faeces, between the way in which a cart drives out through a gateway and the way in which faeces leave the body, and so on [pp. 51–2].

By this time, however, the position occupied by Hans in the analysis had become very different from what it had been at an earlier stage. Previously, his father had been able to tell him in advance what was coming, while Hans had merely followed his lead and come trotting after; but now it was Hans who was forging ahead, so rapidly and steadily that his father found it difficult to keep up with him. Without any warning, as it were, Hans produced a new phantasy: the plumber unscrewed the bath in which Hans was, and then stuck him in the stomach with his big borer [p. 50]. Henceforward the material brought up in the analysis far outstripped our powers of understanding it. It was not [128] until later that it was possible to guess that this was a remoulding of a *phantasy of procreation*, distorted by anxiety. The big bath of water, in which Hans imagined himself, was his mother's womb; the 'borer',

which his father had from the first recognized as a penis, owed its mention to its connection with 'being born'. The interpretation that we are obliged to give to the phantasy will of course sound very curious: 'With your big penis you "bored" me' (i.e. 'gave birth to me') 'and put me in my mother's womb.' For the moment, however, the phantasy eluded interpretation, and merely served Hans as a starting point from which to continue giving information.

Hans showed fear of being given a bath in the big bath [p. 51 above]; and this fear was once more a composite one. One part of it escaped us as yet, but the other part could at once be elucidated in connection with his baby sister having her bath. Hans confessed to having wished that his mother might drop the child while she was being given her bath, so that she should die [p. 56]. His own anxiety while he was having his bath was a fear of retribution for this evil wish and of being punished by the same thing happening to him. Hans now left the subject of lumf and passed on directly to that of his baby sister. We may well imagine what this juxtaposition signified: nothing less, in fact, than that little Hanna was a lumf herself – that all babies were lumfs and were born like lumfs. We can now recognize that all furniture vans and drays and buses were only stork-box carts, and were only of interest to Hans as being symbolic representations of pregnancy; and that when a heavy or heavily loaded horse fell down he can have seen in it only one thing – a childbirth, a delivery ['*ein Niederkommen*'].[1] Thus the falling horse was not only his dying father but also his mother in childbirth.

[129] And at this point Hans gave us a surprise, for which we were not in the very least prepared. He had noticed his mother's pregnancy, which had ended with the birth of his little sister when he was three and a half years old, and had, at any rate after the confinement, pieced the facts of the case together – without telling anyone, it is true, and perhaps without being able to tell anyone. All that could be seen at the time was that immediately after the delivery he had taken up an extremely sceptical attitude towards everything that might be supposed to point to the presence of the stork [p. 9]. *But that – in complete contradiction to his official speeches – he knew in his unconscious where the baby came from and where it had been before* is proved beyond a shadow of doubt by the present analysis; indeed, this is perhaps its most unassailable feature.

The most cogent evidence of this is furnished by the phantasy (which he persisted in with so much obstinacy, and embellished with such a wealth of detail) of how Hanna had been with them at Gmunden the

1 [See footnote, p. 74 above. – Further discussion of this particular symbolism can be found in Freud's paper on a childhood memory of Goethe's (1917*b*), *RSE*, **17**, 146 f.]

summer before her birth, of how she had travelled there with them, and of how she had been able to do far more then than she had a year later, after she had been born [p. 53 ff. above]. The effrontery with which Hans related this phantasy and the countless extravagant lies with which he interwove it were anything but meaningless. All of this was intended as a revenge upon his father, against whom he harboured a grudge for having misled him with the stork fable. It was just as though he had meant to say: 'If you really thought I was as stupid as all that, and expected me to believe that the stork brought Hanna, then in return I expect *you* to accept *my* inventions as the truth.' This act of revenge on the part of our young enquirer upon his father was succeeded by the clearly correlated phantasy of teasing and beating horses [p. 61]. This phantasy, again, had two constituents. On the one hand, it was based upon the teasing to which he had submitted his father just before; and, on the other hand, it reproduced the obscure sadistic desires directed towards his mother, [130]
which had already found expression (though they had not at first been understood) in his phantasies of doing something forbidden. Hans even confessed consciously to a desire to beat his mother [p. 62].

There are not many more mysteries ahead of us now. An obscure phantasy of missing a train [p. 63] seems to have been a forerunner of the later notion of handing over Hans's father to his grandmother at Lainz, for the phantasy dealt with a visit to Lainz, and his grandmother appeared in it. Another phantasy, in which a boy gave the guard 50,000 florins to let him ride on the truck [p. 64], almost sounds like a plan of buying his mother from his father, part of whose power, of course, lay in his wealth. At about this time, too, he confessed, with a degree of openness which he had never before reached, that he wished to get rid of his father, and that the reason he wished it was that his father interfered with his own intimacy with his mother [p. 63]. We must not be surprised to find the same wishes constantly reappearing in the course of an analysis. The monotony only attaches to the analyst's interpretations of these wishes. For Hans they were not mere repetitions, but steps in a progressive development from timid hinting to fully conscious, undistorted perspicuity.

What remains are just such confirmations on Hans's part of analytical conclusions which our interpretations had already established. In an entirely unequivocal symptomatic act, which he disguised slightly from the maid but not at all from his father, he showed how he imagined a birth took place [p. 65]; but if we look into it more closely we can see that he showed something else, that he was hinting at something which

was not alluded to again in the analysis. He pushed a small penknife which belonged to his mother in through a round hole in the body of an india-rubber doll, and then let it drop out again by tearing apart the
[131] doll's legs. The enlightenment which he received from his parents soon afterwards [p. 67 above], to the effect that children do, in fact, grow inside their mother's body and are pushed out of it like a lumf, came too late; it could tell him nothing new. Another symptomatic act, happening as though by accident, involved a confession that he had wished his father dead; for, just at the moment his father was talking of this death wish, Hans let a horse that he was playing with fall down – knocked it over in fact. Further, he confirmed in so many words the hypothesis that heavily loaded carts represented his mother's pregnancy to him, and the horse's falling down was like having a baby. The most delightful piece of confirmation in this connection – a proof that, in his view, children were 'lumfs' – was his inventing the name of 'Lodi' for his favourite child. There was some delay in reporting this fact, for it then appeared that he had been playing with this sausage child of his for a long time past [p. 72].[1]

We have already considered Hans's two concluding phantasies, with which his recovery was rounded off. One of them [p. 75], that of the plumber giving him a new and, as his father guessed, a bigger widdler, was not merely a repetition of the earlier phantasy concerning the plumber and the bath. The new one was a triumphant, wishful phantasy, and with it he overcame his fear of castration. His other phantasy [p. 74], which confessed to the wish to be married to his mother and to have many children by her, did not merely exhaust the content of the unconscious complexes which had been stirred up by the sight of the falling horse and which had generated his anxiety. It also corrected that portion
[132] of those thoughts which was entirely unacceptable; for, instead of killing his father, it made him innocuous by promoting him to a marriage with Hans's grandmother. With this phantasy both the illness and the analysis came to an appropriate end.

While the analysis of a case is in progress it is impossible to obtain any clear impression of the structure and development of the neurosis. That is the business of a synthetic process which must be performed

1 I remember a set of drawings by T. T. Heine in a copy of *Simplicissimus*, in which that brilliant illustrator depicted the fate of the pork-butcher's child, who fell into the sausage machine, and then, in the shape of a small sausage, was mourned over by his parents, received the Church's blessing, and flew up to Heaven. The artist's idea seems a puzzling one at first, but the Lodi episode in this analysis enables us to trace it back to its infantile root.

subsequently. In attempting to carry out such a synthesis of Little Hans's phobia we shall take as our basis the account of his mental constitution, of his governing sexual wishes, and of his experiences up to the time of his sister's birth, which we have given in an earlier part of this paper.

The arrival of his sister brought into Hans's life many new elements, which from that time on gave him no rest. In the first place he was obliged to submit to a certain degree of privation: to begin with, a temporary separation from his mother, and later a permanent diminution in the amount of care and attention which he had received from her and which thenceforward he had to grow accustomed to sharing with his sister. In the second place, he experienced a revival of the pleasures he had enjoyed when he was looked after as an infant; for they were called up by all that he saw his mother doing for the baby. As a result of these two influences his erotic needs became intensified, while at the same time they began to obtain insufficient satisfaction. He made up for the loss which his sister's arrival had entailed for him by imagining that he had children of his own; and so long as he was at Gmunden – on his second visit there[1] – and could really play with these children, he found a sufficient outlet for his affections. But after his return to Vienna he was once more alone, and set all his hopes upon his mother. He had meanwhile suffered another privation, having been exiled from his parents' bedroom at the age of four and a half.[2] His intensified erotic excitability now found expression in phantasies, by which in his loneliness he conjured up his playmates of the past summer, and in regular auto-erotic satisfaction obtained by a masturbatory stimulation of his genitals. [133]

But in the third place his sister's birth stimulated him to an effort of thought which, on the one hand, it was impossible to bring to a conclusion, and which, on the other hand, involved him in emotional conflicts. He was faced with the great riddle of where babies come from, which is perhaps the first problem to engage a child's mental powers [*Geisteskräfte*][T], and of which the riddle of the Theban Sphinx is probably no more than a distorted version.[3] He rejected the proffered solution of the stork having brought Hanna. For he had noticed that months before the baby's birth his mother's body had grown big, that then she had gone to bed, and had groaned while the birth was taking place, and *Geist*

1 [This parenthesis was added in 1924.]

2 [In the earlier editions 'four', which was altered to 'four and a half' in 1924. See, however, 'Little Hans's' father's remark (3) on p. 76 above. The sleeping arrangements may have been changed at the time of the move into the new flat (p. 13).]

3 [Freud emended this view, as regards girls, in a footnote to his paper on the distinction between the sexes (1925*j*), *RSE*, **19**, 253 *n.* 2.]

that when she got up she was thin again. He therefore inferred that Hanna had been inside his mother's body, and had then come out like a 'lumf'. He was able to imagine the act of giving birth as a pleasurable one by relating it to his own first feelings of pleasure in passing stool; and he was thus able to find a double motive for wishing to have children of his own: the pleasure of giving birth to them and the pleasure (the compensatory pleasure, as it were) of looking after them. There was nothing in all of this that could have led him into doubts or conflicts.

But there was something else, which could not fail to make him uneasy.
[134] His father must have had something to do with little Hanna's *birth*, for he had declared that Hanna and Hans himself were his children. Yet it was certainly not his father who had brought them into the world, but his mother. This father of his came between him and his mother. When he was there Hans could not sleep with his mother, and when his mother wanted to take Hans into bed with her, his father used to call out. Hans had learnt from experience how well-off he could be in his father's absence, and it was only justifiable that he should wish to get rid of him. And then Hans's hostility had received a fresh reinforcement. His father had told him the lie about the stork and so made it impossible for him to ask for enlightenment upon these things. He not only prevented his being in bed with his mother, but also kept from him the knowledge he was thirsting for. He was putting Hans at a disadvantage in both directions, and was obviously doing so for his own benefit.

But this father, whom he could not help hating as a rival, was the same father whom he had always loved and was bound to go on loving, who had been his model, had been his first playmate, and had looked after him from his earliest infancy: and this it was that gave rise to the first conflict. Nor could this conflict find an immediate solution. For Hans's nature had so developed that for the moment his love could not but keep the upper hand and suppress his hate – though it could not kill it, for his hate was perpetually kept alive by his love for his mother.

But his father not only knew where children came from, he actually performed it – the thing that Hans could only obscurely divine. The widdler must have something to do with it, for his own grew excited whenever he thought of these things – and it must be a big widdler too, bigger than Hans's own. If he listened to these premonitory sensations he could only suppose that it was a question of some act of violence performed upon his mother, of smashing something, of making an open-
[135] ing into something, of forcing a way into an enclosed space – such were the impulses that he felt stirring within him. But although the sensations

of his penis had put him on the road to postulating a vagina, yet he could not solve the problem, for within his experience no such thing existed as his widdler required. On the contrary, his conviction that his mother possessed a penis just as he did stood in the way of any solution. His attempt at discovering what it was that had to be done with his mother in order that she might have children sank down into his unconscious; and his two active impulses – the hostile one towards his father and the sadistic-tender one towards his mother – could be put to no use, the first because of the love that existed side by side with the hatred, and the second because of the perplexity in which his infantile sexual theories left him.

This is how, basing my conclusions upon the findings of the analysis, I am obliged to reconstruct the unconscious complexes and wishes, the repression and reawakening of which produced Little Hans's phobia. I am aware that in so doing I am attributing a great deal to the mental capacity of a child between four and five years of age; but I have let myself be guided by what we have recently learnt, and I do not consider myself bound by the prejudices of our ignorance. It might perhaps have been possible to make use of Hans's fear of the 'making a row with the legs' for filling in a few more gaps in our adjudication upon the evidence. Hans, it is true, declared that it reminded him of his kicking about with his legs when he was compelled to leave off playing so as to do lumf; so that this element of the neurosis becomes connected with the problem whether his mother liked having children or was compelled to have them. But I have an impression that this is not the whole explanation of the 'making a row with the legs'. Hans's father was unable to confirm my suspicion that there was some recollection stirring in the child's mind of having observed a scene of sexual intercourse between [136]
his parents in their bedroom. So let us be content with what we have discovered.

It is hard to say what the influence was which, in the situation we have just sketched, led to the sudden change in Hans and to the transformation of his libidinal longing into anxiety – to say from what direction it was that repression set in. The question could probably only be decided by making a comparison between this analysis and a number of similar ones. Whether the scales were turned by the child's *intellectual* inability to solve the difficult problem of the begetting of children and to cope with the aggressive impulses that were liberated by his approaching its solution, or whether the effect was produced by a *somatic* incapacity, a constitutional intolerance of the masturbatory gratification in which he

regularly indulged (whether, that is, the mere persistence of sexual excitement at such a high pitch of intensity was bound to bring about a revulsion) – this question must be left open until fresh experience can come to our assistance.

Chronological considerations make it impossible for us to attach any great importance to the actual precipitating cause of the outbreak of Hans's illness, for he had shown signs of apprehensiveness long before he saw the bus-horse fall down in the street.

Nevertheless, the neurosis took its start directly from this chance event and preserved a trace of it in the circumstance of the horse being exalted into the object of his anxiety. In itself the impression of the accident which he happened to witness carried no 'traumatic force'; it acquired its great effectiveness only from the fact that horses had formerly been of importance to him as objects of his predilection and interest, from the fact that he associated the event in his mind with an earlier event at Gmunden which had more claim to be regarded as traumatic, namely, with Fritzl's falling down while he was playing at horses, and lastly from the fact that there was an easy path of association from
[137] Fritzl to his father. Indeed, even these connections would probably not have been sufficient if it had not been that, thanks to the pliability and ambiguity of associative chains, the same event showed itself capable of stirring the second of the complexes that lurked in Hans's unconscious, the complex of his pregnant mother's confinement. From that moment the way was clear for the return of the repressed; and it returned in such a manner that *the pathogenic material was remodelled and transposed on to the horse complex, while the accompanying affects were uniformly turned into anxiety*.

It deserves to be noticed that the ideational content [*Vorstellungsinhalt*] of Hans's phobia as it then stood had to be submitted to one further process of distortion and substitution before his consciousness took cognizance of it. Hans's first formulation of his anxiety was: 'the horse will bite me'; and this was derived from another episode at Gmunden, which was, on the one hand, related to his hostile wishes towards his father and, on the other hand, was reminiscent of the warning he had been given against masturbation. Some interfering influence, emanating from his parents perhaps, had made itself felt. I am not certain whether the reports upon Hans were at that time drawn up with sufficient care to enable us to decide whether he expressed his anxiety in this form *before* or not until *after* his mother had taken him to task on the subject of masturbating. I should be inclined to suspect that it was not

until afterwards, though this would contradict the account given in the case history. [See p. 19 f. above.] At any rate, it is evident that at every point Hans's hostile complex against his father screened his lustful one about his mother, just as it was the first to be disclosed and dealt with in the analysis.

In other cases of this kind there would be a great deal more to be said upon the structure, the development and the diffusion of the neurosis. But the history of Little Hans's attack was very short; almost as soon as it had begun, its place was taken by the history of its treatment. And although during the treatment the phobia appeared to develop further [138]
and to extend over new objects and to lay down new conditions, his father, since he was himself treating the case, naturally had sufficient penetration to see that it was merely a question of the emergence of material that was already in existence, and not of fresh productions for which the treatment might be held responsible. In the treatment of other cases it would not always be possible to count upon so much penetration.

Before I can regard this synthesis as completed I must turn to yet another aspect of the case, which will take us into the very heart of the difficulties that lie in the way of our understanding of neurotic states. We have seen how our little patient was overtaken by a great wave of repression and that it caught precisely those of his sexual components that were dominant.[1] He gave up masturbation, and turned away in disgust from everything that reminded him of excrement and of looking on at other people performing their natural functions. But these were not the components which were stirred up by the precipitating cause of the illness (his seeing the horse fall down) or which provided the material for the symptoms, that is, the content of the phobia.

This allows us, therefore, to make a radical distinction. We shall probably come to understand the case more deeply if we turn to those other components which *do* fulfil the two conditions that have just been mentioned. These other components were tendencies in Hans which had already been suppressed and which, so far as we can tell, had never been able to find uninhibited expression: hostile and jealous feelings towards his father, and sadistic impulses (premonitions, as it were, of copulation) towards his mother. These early suppressions may perhaps have gone [139]
to form the predisposition for his subsequent illness. These aggressive

1 Hans's father even observed that simultaneously with this repression a certain amount of sublimation set in. From the time of the beginning of his anxiety Hans began to show an increased interest in music and to develop his inherited musical gift. ['Little Hans's' father was an eminent musicologist. The point is amplified by the fact that 'Little Hans' went on to pursue a successful musical career (see Mächtlinger, 1995).]

propensities of Hans's found no outlet, and as soon as there came a time of privation and of intensified sexual excitement, they tried to break their way out with reinforced strength. It was then that the battle which we call his 'phobia' burst out. During the course of it a part of the repressed ideas, in a distorted form and transposed on to another complex, forced their way into consciousness as the content of the phobia. But it was a decidedly paltry success. Victory lay with the forces of repression; *and they made use of the opportunity to extend their dominion over components other than those that had rebelled*. This last circumstance, however, does not in the least alter the fact that the essence of Hans's illness was entirely dependent upon the nature of the drive components that had to be repulsed. The content of his phobia was such as to impose a very great measure of restriction upon his freedom of movement, and that was its purpose. It was therefore a powerful reaction against the obscure impulses to movement which were especially directed against his mother. For Hans horses had always typified pleasure in movement ('I'm a young horse', he had said as he jumped about [p. 45 above]); but since this pleasure in movement included the impulse to copulate, the neurosis imposed a restriction on it and exalted the horse into an emblem of terror. Thus it would seem as though all that the repressed drives got from the neurosis was the honour of providing pretexts for the appearance of the anxiety in consciousness. But however clear may have been the victory in Hans's phobia of the forces that were opposed to sexuality, nevertheless, since such an illness is in its very nature a compromise, this cannot have been all that the repressed drives obtained. After all, Hans's phobia of horses was an obstacle to his going into the street, and could serve as a means of allowing him to stay at home with
[140] his beloved mother. In this way, therefore, his affection for his mother triumphantly achieved its aim. In consequence of his phobia, the lover clung to the object of his love – though, to be sure, steps had been taken to make him innocuous. The true character of a neurotic disorder is exhibited in this twofold result.

Alfred Adler, in a suggestive paper,[1] has recently developed the view that anxiety arises from the suppression of what he calls the 'aggressive drive' ['*Aggressionstrieb*'], and by a very sweeping synthetic process he ascribes to that drive the chief part in human events, 'in real life and in the neuroses'. As we have come to the conclusion that in our present

1 '*Der Aggressionstrieb im Leben und in der Neurose*' (1908). This is the same paper from which I have borrowed the term 'confluence of drives'. (See above, p. 82 [and p. 97].) [Adler read this paper at a meeting of the Vienna Psychoanalytical Society on June 3, 1908, and some comments on it by Freud appear in the Minutes for that date (see *Minutes*, **1**). Cf. also the Editors' Introduction to *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 57.]

case of phobia the anxiety is to be explained as being due to the repression of Hans's aggressive propensities (the hostile ones against his father and the sadistic ones against his mother), we seem to have produced a most striking piece of confirmation of Adler's view. I am nevertheless unable to assent to it, and indeed I regard it as a misleading generalization. I cannot bring myself to assume the existence of a special aggressive drive alongside of the familiar drives to self-preservation and to sex [*Selbsterhaltungs- und Sexualtrieben*], and on an equal footing with them.[1] It appears to me that Adler has mistakenly promoted into a special and self-subsisting drive what is in reality a universal and indispensable [141]
attribute of *all* drives – their 'driven' ['*Triebhafte*'] and pressing character, what might be described as their capacity for initiating movement. Nothing would then remain of the other drives but their relation to an aim, for their relation to the means of reaching that aim would have been taken over from them by the 'aggressive drive'. In spite of all the uncertainty and obscurity of our theory of drives I should prefer for the present to adhere to the usual view, which leaves each drive its own power of becoming aggressive;[2] and I should be inclined to recognize the two drives which became repressed in Hans as familiar components of the sexual libido.[3]

(III)

I shall now proceed to what I hope will be a brief discussion of how far Little Hans's phobia offers any contribution of general importance to our views upon the life and upbringing of children. But before doing so I must return to the objection which has so long been held over, and

1 [*Footnote added* 1923:] The above passage was written at a time when Adler seemed still to be taking his stand upon the ground of psychoanalysis, and before he had put forward the masculine protest and disavowed repression. Since then I have myself been obliged to assert the existence of an 'aggressive drive', but it is different from Adler's. I prefer to call it the 'destructive' or 'death drive'. See *Beyond the Pleasure Principle* (1920*g*) [*RSE*, **18**, 51 ff.] and *The Ego and the Id* (1923*b*) [ibid., **19**, 35 ff.]. Its opposition to the libidinal drives finds an expression in the familiar polarity of love and hate. My disagreement with Adler's view, which [as explained later in the paragraph] results in a universal characteristic of drives in general being reduced to be the property of a single one of them, remains unaltered. – [A detailed account of Freud's differences with Adler can be found in his 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 44 ff. Cf. also, however, Chapter VI of *Civilization and its Discontents* (1930*a*), ibid., **21**, 107, where Freud recalls with surprise his own reluctance to recognize the ubiquity of non-erotic destructiveness.]

2 [In the earlier editions the words 'without being directed towards an object' occurred at this point. They were omitted in 1924.]

3 [This case history is used by Freud as a basis for discussing the nature of anxiety in Chapters IV and VII of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 90 ff. and 110 ff. – It is also quoted in connection with totemism and animal phobias in *Totem and Taboo* (1912–13*a*), ibid., **13**, 119 ff.]

according to which Hans was a neurotic, a 'degenerate' with a bad heredity, and not a normal child, knowledge about whom could be applied to other children. I have for some time been thinking with pain of the way in which the adherents of 'the normal person' will fall upon poor Little Hans as soon as they are told that he can, in fact, be shown to have had a hereditary taint. His beautiful mother fell ill with a neurosis
[142] as a result of a conflict during her girlhood. I was able to be of assistance to her at the time, and this had, in fact, been the beginning of my connection with Hans's parents. It is only with the greatest diffidence that I venture to bring forward one or two considerations in his favour.

In the first place Hans was not what one would understand, strictly speaking, by a degenerate child, condemned by his heredity to be a neurotic. On the contrary, he was well formed physically, and was a cheerful, amiable, active-minded young fellow who might give pleasure to more people than his own father. There can be no question, of course, as to his sexual precocity; but on that point there is very little material upon which a fair comparison can be based. I gather, for instance, from a piece of collective research conducted in America,[1] that it is by no means such a rare thing to find object choice and feelings of love in boys at a similarly early age; and the same may be learnt from studying the records of the childhood of men who have later come to be recognized as 'great'. I should therefore be inclined to believe that sexual precocity is a correlate, which is seldom absent, of intellectual precocity, and that it is therefore to be met with in gifted children more often than might be expected.[2]

Furthermore, let me say in Hans's favour (and I frankly admit my partisan attitude) that he is not the only child who has been overtaken by a phobia at some time or other in his childhood. Troubles of that kind are well known to be quite extraordinarily frequent, even in children the strictness of whose upbringing [*Erziehung*] has left nothing to be desired. In later life these children either become neurotic or remain healthy. Their phobias are shouted down in the nursery because they are inaccessible to treatment and are decidedly inconvenient. In the course of months or years they diminish, and the child seems to recover; but
[143] no-one can tell what psychological changes are necessitated by such a recovery, or what alterations in character are involved in it. When, however, an adult neurotic patient comes to us for psychoanalytic treatment

1 [Sanford Bell (1902).]

2 [This question is touched on in a paragraph on 'Precocity' in Freud's *Three Essays* (1905*d*), *RSE*, 7, 213.]

(and let us assume that his illness has become manifest only after he has reached maturity), we find regularly that his neurosis has as its point of departure an infantile anxiety such as we have been discussing, and is, in fact, a continuation of it; so that, as it were, a continuous and undisturbed thread of psychical activity, taking its start from the conflicts of his childhood, has been spun through his life – irrespective of whether the first symptom of those conflicts has persisted or has retreated under the pressure of circumstances. I think, therefore, that Hans's illness may perhaps have been no more serious than that of many other children who are not branded as 'degenerates'; but since he was brought up without being intimidated, and with as much consideration and as little coercion as possible, his anxiety dared to show itself more boldly. With him there was no place for such motives as a bad conscience or a fear of punishment, which with other children must no doubt contribute to making the anxiety less. It seems to me that we concentrate too much upon symptoms and concern ourselves too little with their causes. In bringing up children we aim only at being left in peace and having no difficulties, in short, at training up a model child, and we pay very little attention to whether such a course of development is for the child's good as well. I can therefore quite imagine that it may have been to Hans's advantage to have produced this phobia. For it directed his parents' attention to the unavoidable difficulties with which a child is confronted when in the course of his cultural training [*Kulturerziehung*][T] he is called upon to *Kultur*
overcome the innate drive components of his mind; and his trouble brought his father to his assistance. It may be that Hans now enjoys an advantage over other children, in that he no longer carries within him that seed in the shape of repressed complexes which must always be of [144]
some significance for a child's later life, and which undoubtedly brings with it a certain degree of deformity of character if not a disposition to a subsequent neurosis. I am inclined to think that this is so, but I do not know if many others will share my opinion; nor do I know whether experience will prove me right.

But I must now enquire what harm was done to Hans by dragging to light in him complexes such as are not only repressed by children but dreaded by their parents. Did the little boy proceed to take some serious action as regards what he wanted from his mother? or did his evil intentions against his father give place to evil deeds? Such misgivings will no doubt have occurred to many doctors, who misunderstand the nature of psychoanalysis and think that wicked drives are strengthened by being made conscious. Wise men like these are being no more than consistent

when they implore us for heaven's sake not to meddle with the evil things that lurk behind a neurosis. In so doing they forget, it is true, that they are physicians, and their words bear a fatal resemblance to Dogberry's, when he advised the Watch to avoid all contact with any thieves they might happen to meet: 'for such kind of men, the less you meddle or make with them, why, the more is for your honesty.'[1]

On the contrary, the only results of the analysis were that Hans recovered, that he ceased to be afraid of horses, and that he got on to rather familiar terms with his father, as the latter reported with some amusement. But whatever his father may have lost in the boy's respect he won back in his confidence: 'I thought', said Hans, 'you knew everything, as you knew that about the horse.' For analysis does not undo the *effects* of repression. The drives which were formerly suppressed remain suppressed; but the same effect is produced in a different way. Analysis replaces the process of repression, which is an automatic and excessive one, with a temperate and purposeful control on the part of the highest agencies of the mind. In a word, *analysis replaces repression with condemnation*. This seems to bring us the long-looked-for evidence that consciousness has a biological function, and that with its entrance upon the scene an important advantage is secured.[2]

[145]

If matters had lain entirely in my hands, I should have ventured to give the child the one remaining piece of enlightenment which his parents withheld from him. I should have confirmed his drive-related premonitions, by telling him of the existence of the vagina and of copulation; thus I should have still further diminished his unsolved residue, and put an end to his stream of questions. I am convinced that this new piece of enlightenment would have made him lose neither his love for his mother nor his own childish nature, and that he would have understood that his preoccupation with these important, these momentous things must rest

1 [*Much Ado about Nothing*, Act III, Scene 3.] At this point I cannot keep back an astonished question. Where do my opponents obtain their knowledge, which they produce with so much confidence, on the question whether the repressed sexual drives play a part, and if so what part, in the aetiology of the neuroses, if they shut their patients' mouths as soon as they begin to talk about their complexes or their derivatives? For the only alternative sources of knowledge remaining open to them are my own writings and those of my adherents.

2 [*Footnote added* 1923:] I am here using the word 'consciousness' in a sense which I later avoided, namely, to describe our normal processes of thought – such, that is, as are capable of consciousness. We know that thought processes of this kind may also take place *preconsciously*; and it is wiser to regard their actual 'consciousness' from a purely phenomenological standpoint. By this I do not, of course, mean to contradict the expectation that consciousness in this more limited sense of the word must also fulfil some biological function. [See *The Ego and the Id* (1923*b*), Chapter I; *RSE*, **19**, 11 ff. Cf. also the early discussion of the biological function of 'consciousness' in the closing pages of *The Interpretation of Dreams* (1900*a*), ibid., **5**, 550 ff. Cf. also *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 24 ff.]

for the present – until his wish to be big had been fulfilled. But the educational experiment was not carried so far.

That no sharp line can be drawn between 'neurotic' and 'normal' [146]
people – whether children or adults – that our conception of 'disease' is a purely practical one and a question of summation, that disposition and the eventualities of life must combine before the threshold of this summation is overstepped, and that consequently a number of individuals are constantly passing from the class of healthy people into that of neurotic patients, while a far smaller number also make the journey in the opposite direction – all of these are things which have been said so often and have met with so much agreement that I am certainly not alone in maintaining their truth. It is, to say the least of it, extremely probable that a child's upbringing can exercise a powerful influence for good or for evil upon the disposition which we have just mentioned as one of the factors in the occurrence of 'disease'; but what that upbringing is to aim at and at what point it is to be brought to bear seem at present to be very doubtful questions. Hitherto education has only set itself the task of controlling, or, it would often be more proper to say, of suppressing, the drives. The results have been by no means gratifying, and where the process has succeeded it has been to the advantage of only a small number of favoured individuals who have not been required to suppress their drives. Nor has anyone enquired by what means and at what cost the suppression of the inconvenient drives has been achieved. Supposing now that we substitute another task for this one, and aim instead at making the individual capable of becoming a civilized and useful member of society with the least possible sacrifice of his own activity; in that case the information gained by psychoanalysis, upon the origin of pathogenic complexes and upon the nucleus of every nervous affection, can claim with justice that it deserves to be regarded by educators as an invaluable guide in their conduct towards children. What practical conclusions may follow from this, and how far experience may justify the application of those conclusions within our present social system, are matters which I [147]
leave to the examination and decision of others.[1]

I cannot take leave of our small patient's phobia without giving expression to a notion which has made its analysis, leading as it did to a recovery, seem of special value to me. Strictly speaking, I learnt nothing new from this analysis, nothing that I had not already been able to

1 [Freud returned to the question of psychoanalysis and the upbringing of children in his prefaces to books by Pfister (1913*b*), *RSE*, **12**, 327, and Aichhorn (1925*f*), ibid., **19**, 279, and in Part II (H) of his contribution to *Scientia* (1913*j*), ibid., **13**, 178 ff. He also devoted some pages to the same subject in Lecture XXXIV of his *New Introductory Lectures* (1933*a*), ibid., **22**, 129 ff.]

discover (though often less distinctly and more indirectly) from other patients analysed at a more advanced age. But the neuroses of these other patients could in every instance be traced back to the same infantile complexes that were revealed behind Hans's phobia. I am therefore tempted to claim for this neurosis of childhood the significance of being a type and a model, and to suppose that the multiplicity of the phenomena of repression exhibited by neuroses and the abundance of their pathogenic material do not prevent their being derived from a very limited number of processes concerned with identical ideational complexes.

POSTSCRIPT (1922)

A few months ago – in the spring of 1922 – a young man introduced [148]
himself to me and informed me that he was the 'Little Hans' whose infantile neurosis had been the subject of the paper which I published in 1909. I was very glad to see him again, for about two years after the end of his analysis I had lost sight of him and had heard nothing of him for more than ten years. The publication of this first analysis of a child had caused a great stir and even greater indignation, and a most evil future had been foretold for the poor little boy, because he had been 'robbed of his innocence' at such a tender age and had been made the victim of a psychoanalysis.

But none of these apprehensions had come true. Little Hans was now a strapping youth of nineteen. He declared that he was perfectly well, and suffered from no troubles or inhibitions. Not only had he come through his puberty without any damage, but his emotional life had successfully undergone one of the severest of ordeals. His parents had been divorced and each of them had married again. In consequence of this he lived by himself; but he was on good terms with both of his parents, and only regretted that as a result of the breaking up of the family he had been separated from the younger sister he was so fond of.

One piece of information given me by Little Hans struck me as particularly remarkable; nor do I venture to give any explanation of it. When he read his case history, he told me, the whole of it came to him as something unknown; he did not recognize himself; he could remember nothing; and it was only when he came upon the journey to Gmunden that there dawned on him a kind of glimmering recollection that it might have been he himself that it happened to. So the analysis had not pre- [149]
served the events from amnesia, but had been overtaken by amnesia itself. Anyone who is familiar with psychoanalysis may occasionally experience something similar in sleep. He will be woken up by a dream, and will decide to analyse it then and there; he will then go to sleep again feeling quite satisfied with the result of his efforts; and next morning dream and analysis will alike be forgotten.[1]

1 [This phenomenon was discussed by Freud in a passage added in 1911 to his *Interpretation of Dreams* (1900*a*), Chapter VII, Section A; *RSE*, **5**, 465–6.]

Freud's treatment of this case began on October 1, 1907. An account of its beginnings, given by Freud and followed by a discussion, occupied two evenings at the Vienna Psychoanalytical Society, on October 30 and November 6. Some account of the Minutes of these two meetings has been given by Federn (1948) in a paper with the title 'Professor Freud: The Beginning of a Case-History'. He gives the date of the second of them incorrectly, however, as November 16. Further short reports on details of the case were given by Freud to the Vienna Psychoanalytical Society on November 20, 1907, and January 22 and April 8, 1908. A longer report was delivered [154] by him at the First International Psychoanalytical Congress, which was held at Salzburg on April 27, 1908. According to Ernest Jones, who was present, Freud's address took over four hours. At the time of the Congress, however, the treatment was not yet finished, for it appears to have lasted until mid-July (see p. 143 *n.* below). In the summer of 1909 he prepared the history for publication. We learn from letters to Jung that he took a month over it and finally sent it to the printers on July 7, 1909. (Cf. Freud, 1974*a*, with the letters to Jung of June 3, 18 and 30, and of July 7, 1909.)

Freud's original record of the earlier part of this treatment, which was made from day to day as the treatment proceeded and which served as the basis of the published case history, has survived. It is published in English translation at the end of this volume. (See p. 195 ff.) The German original text was not published until 1974. (See Freud, 1955*a*.) These notes on the case include a considerable amount of extra detail not incorporated in the published history, and this material has been drawn upon in the editorial commentary to the present edition in places where it serves to illuminate some of the complications of the case. A chronological list of events, derived from the published case history and the original record, is also appended (p. 193). For further details regarding this case, and a thoroughgoing analysis of the original record, the published case history and the *SE* translation, see Mahony (1986). His work, too, has been drawn upon in the editorial commentary to the present edition.

(In all editions before 1955 the patient is referred to once as 'Lieutenant H.' (p. 133), and the 'cruel captain' as 'Captain M.' (p. 130). In order to harmonize these letters with the pseudonyms chosen for the 'Original Record', they have here been changed to 'L' and 'N', respectively.)

NOTES UPON A CASE OF OBSESSIONAL NEUROSIS

[INTRODUCTION]

The matter contained in the following pages will be of two kinds. In the [155]
first place I shall give some fragmentary extracts from the history of a case of obsessional neurosis [*Zwangsneurose*][T]. This case judged by its length, the injuriousness of its effects, and the patient's own view of it, deserves to be classed as a moderately severe one; the treatment, which lasted for about a year, led to the complete restoration of the patient's personality, and to the removal of his inhibitions. In the second place, starting out from this case, and also taking into account other cases which I have previously analysed, I shall make some disconnected statements of an aphoristic character upon the genesis and finer psychological mechanism of obsessional processes [*seelischen Zwangsvorgänge*], and I shall thus hope to develop my first observations on the subject, published in 1896.[1]

A programme of this kind seems to me to require some justification. For it might otherwise be thought that I regard this method of making a communication as perfectly correct and as one to be imitated; whereas in reality I am only accommodating myself to obstacles, some external and others inherent in the subject, and I should gladly have communicated more if it had been right or possible for me to do so. I cannot give a complete history of the treatment, because that would involve my entering in detail into the circumstances of my patient's life. The importunate interest of a capital city, focused with particular attention upon my medical activities, forbids my giving a faithful picture of the case. On the other hand, I have come more and more to regard the distortions [156]
usually resorted to in such circumstances as useless and objectionable. If the distortions are slight, they fail in their object of protecting the patient from indiscreet curiosity; while if they go beyond this they require too

1 'Further Remarks on the Neuropsychoses of Defence', 1896*b* (Section II. 'The Nature and Mechanism of Obsessional Neurosis') [*RSE*, **3**, 178 ff.].

great a sacrifice, for they destroy the intelligibility of the material, which depends for its coherence precisely upon the small details of real life. And from this latter circumstance follows the paradoxical truth that it is far easier to divulge the patient's most intimate secrets than the most innocent and trivial facts about him; for, whereas the former would not throw any light on his identity, the latter, by which he is generally recognized, would make it obvious to everyone.[1]

Such is my excuse for having curtailed so drastically the history of this case and its treatment. And I can offer still more cogent reasons for having confined myself to the statement of only some disconnected results of the psychoanalytic investigation of obsessional neuroses. I must confess that I have not yet succeeded in completely penetrating the complicated texture of a *severe* case of obsessional neurosis, and that, if I were to reproduce the analysis, it would be impossible for me to make the structure, such as by the help of analysis we know or suspect it to be, visible to others through the mass of therapeutic work superimposed upon it. What add so greatly to the difficulty of doing this are the resistances of the patients and the forms in which they are expressed. But even apart from this it must be admitted that an obsessional neurosis is in itself not an easy thing to understand – much less so than a case of hysteria. Actually, indeed, we should have expected to find the contrary. The language of an obsessional neurosis – the means by which it expresses its
[157] secret thoughts – is, as it were, only a dialect of the language of hysteria; but it is a dialect in which we ought to be able to find our way about [*Einfühlung*][T] more easily[t], since it is more nearly related to the forms of expression adopted by our conscious thought than is the language of hysteria. Above all, it does not involve the leap from a mental process to a somatic innervation – hysterical conversion – which can never be fully comprehensible to us.

Perhaps it is only because we are less familiar with obsessional neuroses that we do not find these expectations confirmed by the facts. Persons suffering from a severe degree of obsessional neurosis present themselves far less frequently for analytic treatment than hysterical patients. They dissimulate their condition in daily life, too, as long as they possibly can, and often call in a physician only when their complaint has reached such an advanced stage as, had they been suffering, for instance, from tuberculosis of the lungs, would have led to their being

1 [In the footnote to the case history of 'Dora' added to Vol. VIII of the *Gesammelte Schriften* (1924) and referred to above on pp. 3–4, Freud expressly states that the present case was published with the patient's assent. See *RSE*, 7, 13 *n.*]

refused admission to a sanatorium. I make this comparison, moreover, because, as with the chronic infectious disease which I have just mentioned, we can point to a number of brilliant therapeutic successes in severe no less than in light cases of obsessional neurosis, where these have been taken in hand at an early stage.

In these circumstances there is no alternative but to report the facts in the imperfect and incomplete fashion in which they are known and in which it is legitimate to communicate them. The crumbs of knowledge offered in these pages, though they have been laboriously enough collected, may not in themselves prove very satisfying; but they may serve as a starting point for the work of other investigators, and common endeavour may bring the success which is perhaps beyond the reach of individual effort.

I
EXTRACTS FROM THE CASE HISTORY

[158] A youngish man of university education[1] introduced himself to me with the statement that he had suffered from obsessional ideas [*Zwangsvorstellungen*][T] ever since his childhood, but with particular intensity for the last four years. The chief feature of his disorder was *fears* that something might happen to two people of whom he was very fond – his father and a lady whom he admired.[t] Besides this he was aware of *compulsive impulses* [*Zwangsimpulse*] – such as an impulse, for instance, to cut his throat with a razor; and further he produced *prohibitions*, sometimes in connection with quite unimportant things. He had wasted years, he told me, in fighting against these ideas of his, and in this way had lost much ground in the course of his life. He had tried various treatments, but none had been of any use to him except a course of hydrotherapy at a sanatorium near —— [Munich];[2] and this, he thought, had probably only been because he had made an acquaintance there which had led to regular sexual intercourse. Here he had no opportunities of the sort, and he seldom had intercourse and only at irregular intervals. He felt disgust at prostitutes. Altogether, he said, his sexual life had been stunted; masturbation had played only a small part in it, in his sixteenth or seventeenth year. His potency was normal; he had first had intercourse at the age of twenty-six.

Vorstellung

He gave me the impression of being a clear-headed and shrewd person. When I asked him what it was that made him lay such stress upon telling me about his sexual life, he replied that that was what he knew about my theories. Actually, however, he had read none of my writings, except [159] that a short time before he had been turning over the pages of one of my books[3] and had come across the explanation of some curious verbal associations which had so much reminded him of some of his own 'efforts of thought' in connection with his ideas [*Ideen*] that he had decided to put himself in my hands.

1 [The 'Rat Man' was a doctor of law. He was 29 years old when he first consulted Freud.]

2 [According to the original record.]

3 *The Psychopathology of Everyday Life* [1901*b*; *RSE*, **6**].

(A) THE BEGINNING OF THE TREATMENT

The next day I made him pledge himself to submit to the one and only condition of the treatment – namely, to say everything that came into his head, even if it was *unpleasant* to him, or seemed *unimportant* or *irrelevant* or *senseless*. I then gave him leave to start his communications with any subject he pleased, and he began thus:[1]

He had a friend, he told me, of whom he had an extraordinarily high opinion. He used always to go to him when he was tormented by some criminal impulse, and ask him whether he despised him as a criminal. His friend used then to give him moral support by assuring him that he was a man of irreproachable conduct, and had probably been in the habit, from his youth onwards, of taking a dark view of his own life. At an earlier date, he went on, another person had exercised a similar influence over him. This was a nineteen-year-old student (he himself had been fourteen or fifteen at the time) who had taken a liking to him, and had raised his self-esteem to an extraordinary degree, so that he appeared to himself to be a genius. This student had subsequently become his tutor, and had suddenly altered his behaviour and begun treating him as [160]
though he were an idiot. At length he had noticed that the student was interested in one of his sisters, and had realized that he had only taken him up in order to gain admission into the house. This had been the first great blow of his life.

He then proceeded without any apparent transition:

(B) INFANTILE SEXUALITY

'My sexual life began very early. I can remember a scene during my fourth or fifth year. (From my sixth year onwards I can remember everything.) This scene came into my head quite distinctly, years later. We had a very pretty young governess called Fräulein Peter.[2] One

1 What follows is based upon notes made on the evening of the day of treatment, and adheres as closely as possible to my recollection of the patient's words. – I feel obliged to offer a warning against the practice of noting down what the patient says during the actual time of treatment. The consequent withdrawal of the physician's attention does the patient more harm than can be made up for by any increase in accuracy that may be achieved in the reproduction of his case history. [This point is enlarged upon in Freud's first paper of technical 'Recommendations' (1912*e*), Sections *b* and *c*; *RSE*, **12**, 109–10.]

2 Dr Alfred Adler, who was formerly an analyst, once drew attention in a privately delivered paper to the peculiar importance which attaches to the *very first* communications made by patients. Here is an instance of this. The patient's opening words laid stress upon the influence exercised over him by men, that is to say, upon the part played in his life by homosexual object choice; but immediately afterwards they touched upon a second motif, which was to become of

evening she was lying on the sofa lightly dressed, and reading. I was lying beside her, and begged her to let me creep under her skirt. She told me I might, so long as I said nothing to anyone about it. She had very little on, and I fingered her genitals and the lower part of her body, which struck me as very peculiar. After this I was left with a burning and tormenting curiosity to see the female body. I can still remember the intense excitement with which I waited at the baths (which I was still allowed to go to
[161] with the governess and my sisters) for the governess to undress and get into the water. I can remember more things from my sixth year onwards. At that time we had another governess, who was also young and good-looking. She had abscesses on her buttocks which she was in the habit of pressing out at night. I used to wait eagerly for that moment, to appease my curiosity. It was just the same at the baths – though Fräulein Lina was more reserved than her predecessor.' (In reply to a question which I threw in, 'As a rule,' the patient told me, 'I did not sleep in her room, but mostly with my parents.') 'I remember a scene which must have taken place when I was seven years old.[1] We were sitting together one evening – the governess, the cook, another servant girl, myself and my brother, who was eighteen months younger than me. The young women were talking, and I suddenly became aware of Fräulein Lina saying: "It could be done with the little one; but Paul" (that was I) "is too clumsy, he would be sure to miss it." I did not understand clearly what was meant, but I felt the slight and began to cry. Lina comforted me, and told me how a girl, who had done something of the kind with a little boy she was in charge of, had been put in prison for several months. I do not believe she actually did anything wrong with me, but I took a great many liberties with her. When I got into her bed I used to uncover her and touch her, and she made no objections. She was not very intelligent, and clearly had very strong sexual cravings. At twenty-three she had already had a child. She afterwards married its father, so that today she is a Frau Hofrat.[2] Even now I often see her in the street.

'When I was six years old I already suffered from erections, and I

great importance later on, namely, the conflict between man and woman and the opposition of their interests. Even the fact that he remembered his first pretty governess by her surname, which happened to be a man's first name, must be taken into account in this connection. In middle-class circles in Vienna it is more usual to call a governess by her first name, and it is by that name that she is more commonly remembered. – [In the original (1909) version, the first words of this footnote ran: 'My colleague Dr Alfred Adler . . .' They were changed to their present form in 1913.]

1 The patient subsequently admitted that this scene probably occurred one or two years later.

2 [The Austrian title of '*Hofrat*' was awarded to prominent physicians, lawyers, university professors, civil servants, etc. It was perhaps equivalent to a knighthood in modern England.]

know that once I went to my mother to complain about them. I know too [162]
that in doing so I had some misgivings to get over, for I had a feeling that there was some connection between this subject and my ideas and inquisitiveness, and at that time I used to have a morbid idea *that my parents knew my thoughts; I explained this to myself by supposing that I had spoken them out loud, without having heard myself do it*. I look on this as the beginning of my illness. There were certain people, girls, who pleased me very much, and I had a very strong wish *to see them naked*. But in wishing this I had *an uncanny feeling, as though something must happen if I thought such things, and as though I must do all sorts of things to prevent it*.'

(In reply to a question he gave an example of these fears: 'For instance, *that my father might die*.') 'Thoughts about my father's death occupied my mind from a very early age and for a long period of time, and greatly depressed me.'

At this point I learnt with astonishment that the patient's father, with whom his obsessional fears were, after all, occupied *now* [p. 122 above], had died several years previously.

The events in his sixth or seventh year which the patient described in the first hour of his treatment were not merely, as he supposed, the beginning of his illness, but were already the illness itself. It was a complete obsessional neurosis, wanting in no essential element, at once the nucleus and the prototype of the later disorder – an elementary organism, as it were, the study of which could alone enable us to obtain a grasp of the complicated organization of his subsequent illness. The child, as we have seen, was under the domination of a component of the sexual drive [*Triebkomponente*][T], the desire to look [scopophilia; *Schaulust*][T], as a *Trieb*
result of which there was a constant recurrence in him of a very intense wish connected with persons of the female sex who pleased him – the wish, that is, to see them naked. This wish corresponds to the later obsessional or compulsive idea; and if the quality of compulsion was not yet present in the wish, this was because the ego had not yet placed itself in [163]
complete opposition to it and did not yet regard it as something foreign to itself. Nevertheless, opposition to this wish from some source or other was already in activity, for its occurrence was regularly accompanied by a distressing affect.[1] A conflict was evidently in progress in the mind of this young libertine. Side by side with the obsessive wish, and intimately associated with it, was an obsessive fear: every time he had a wish of this

1 Yet attempts have been made to explain obsessions without taking the affects into account!

kind he could not help fearing that something dreadful would happen. This something dreadful was already clothed in a characteristic indeterminateness which was thenceforward to be an invariable feature of every manifestation of the neurosis. But in a child it is not hard to discover what it is that is veiled behind an indeterminateness of this kind. If the patient can once be induced to give a particular instance in place of the vague generalities which characterize an obsessional neurosis, it may be confidently assumed that the instance is the original and actual thing which has tried to hide itself behind the generalization. Our present patient's obsessive fear, therefore, when restored to its original meaning, would run as follows: 'If I have this wish to see a woman naked, my father will be bound to die.' The distressing affect was distinctly coloured with a tinge of uncanniness [*Unheimlichen*] and superstition, and was already beginning to give rise to impulses to do something to ward off the impending evil. These impulses were subsequently to develop into the *protective measures* which the patient adopted.

We find, accordingly: an erotic drive [*Trieb*] and a revolt against it; a wish which has not yet become compulsive and, struggling against it,[1] a fear which is already compulsive; a distressing affect and an impulsion towards the performance of defensive acts [*Abwehrhandlungen*][T]. The inventory of the neurosis has reached its full muster. Indeed, something more is present, namely, a kind of *delusion* [*Wahnbildung*] or *delirium*[2] with the strange content that his parents knew his thoughts because he spoke them out loud without his hearing himself do it. We shall not go far astray if we suppose that in making this attempt at an explanation the child had some inkling of those remarkable mental processes which we describe as unconscious and which we cannot dispense with if we are to throw any scientific light upon this obscure subject. 'I speak my thoughts out loud, without hearing them' sounds like a projection into the external world of our own hypothesis that he had thoughts without knowing anything about them; it sounds like an endopsychic perception of what has been repressed [*Verdrängten*][T].

Abwehr

[164]

Verdrängung

For the situation is clear. This elementary neurosis of childhood already involved a problem and an apparent absurdity, like any complicated neurosis of maturity. What can have been the meaning of the child's idea that if he had this lascivious wish his father would be bound

1 ['struggling against him (*ihm*)' in the original German, which is clearly an error – and possibly Freud's own.]

2 ['Delirium' is here and elsewhere in this paper used in a special sense which is explained below on pp. 168–9. In French and German psychiatry, the term often corresponds to the English 'delusion'.]

to die? Was it sheer nonsense? Or are there means of understanding the words and of perceiving them as a necessary consequence of earlier events and premises?

If we apply knowledge gained elsewhere to this case of childhood neurosis, we shall not be able to avoid a suspicion that in this instance as in others (that is to say, before the child had reached his sixth year) there had been conflicts and repressions, which had themselves been overtaken by amnesia, but had left behind them as a residuum the particular content of this obsessive fear. Later on, we shall learn how far it is possible for us to rediscover those forgotten experiences or to reconstruct them with some degree of certainty. In the meantime stress may be laid on the fact, which is probably more than a mere coincidence, that the patient's infantile amnesia ended precisely with his sixth year [see p. 123 above]. [165]

To find a chronic obsessional neurosis beginning like this in early childhood, with lascivious wishes of this sort connected with uncanny apprehensions and an inclination to the performance of defensive acts, is no new thing to me. I have come across it in a number of other cases. It is absolutely typical, although probably not the only possible type. Before proceeding to the events of the second session, I should like to add one more word on the subject of the patient's early sexual experiences. It will hardly be disputed that they may be described as having been considerable both in themselves and in their consequences. But it has been the same with the other cases of obsessional neurosis that I have had the opportunity of analysing. Such cases, unlike those of hysteria, invariably possess the characteristic of premature sexual activity. Obsessional neuroses make it much more obvious than hysterias that the factors which go to form a psychoneurosis are to be found in the patient's *infantile* sexual life and not in his present one. The current sexual life of an obsessional neurotic may often appear perfectly normal to a superficial observer; indeed, it frequently offers to the eye far fewer pathogenic elements and abnormalities than in the instance we are now considering.

(c) THE GREAT OBSESSIVE FEAR

'I think I will begin today with the experience which was the immediate occasion of my coming to you. It was in August, during the manoeuvres in —— [Galicia].[1] I had been suffering before, and tormenting myself

1 [A province of the old Austro-Hungarian Empire, now part of Ukraine.]

with all kinds of obsessional thoughts, but they had quickly passed off during the manoeuvres. I was keen to show the regular officers that people like me not only had learnt a good deal but could stand a good deal too. One day we started from —— [Spas][1] on a short march. During a halt
[166] I lost my pince-nez, and, although I could easily have found them, I did not want to delay our start, so I gave them up. But I wired to my opticians in Vienna to send me another pair by the next post. During that same halt I sat between two officers, one of whom, a captain with a Czech name, was to be of no small importance to me. I had a kind of dread of him, *for he was obviously fond of cruelty*. I do not say he was a bad man, but at the officers' mess he had repeatedly defended the introduction of corporal punishment, so that I had been obliged to disagree with him very sharply. Well, during this halt we got into conversation, and the captain told me he had read of a specially horrible punishment used in the East . . .'[2]

Here the patient broke off, got up from the sofa, and begged me to spare him the recital of the details. I assured him that I myself had no taste whatever for cruelty, and certainly had no desire to torment him, but that naturally I could not grant him something which was beyond my power. He might just as well ask me to give him the moon [*zwei Kometen*][t]. The overcoming of resistances was a law of the treatment, and on no consideration could it be dispensed with. (I had explained the idea of 'resistance' to him at the beginning of the hour, when he told me there was much in himself which he would have to overcome if he was to relate this experience of his.) I went on to say that I would do all I could, nevertheless, to guess the full meaning of any hints he gave me. Was he perhaps thinking of impalement? – 'No, not that; . . . the criminal was tied up . . .' – he expressed himself so indistinctly that I could not immediately guess in what position – '. . . a pot was turned upside down on his buttocks . . . some *rats* were put into it . . . and they . . .' – he had again got up, and was showing every sign of horror and resistance – '. . . *bored their way in* . . .' – Into his anus, I helped him out.

At all the more important moments while he was telling his story his
[167] face took on a very strange, composite expression. I could only interpret it as one of *horror at pleasure of his own of which he himself was unaware*. He proceeded with the greatest difficulty: 'At that moment the idea flashed through my mind *that this was happening to a person who*

1 [Incidentally, both of Freud's parents were Galician. His mother was born about 40km from Spas.]

2 [Captain N. probably got his cruel story from a pornographic bestseller of the day, Octave Mirbeau's *Le Jardin des supplices*.]

was very dear to me.'[1] In answer to a direct question he said that it was not he himself who was carrying out the punishment, but that it was being carried out as it were impersonally. After a little prompting I learnt that the person to whom this 'idea' of his related was the lady whom he admired.

He broke off his story in order to assure me that these thoughts were entirely foreign and repugnant to him, and to tell me that everything which had followed in their train had passed through his mind with the most extraordinary rapidity. Simultaneously with the idea there always appeared a 'sanction', that is to say, the defensive measure which he was obliged to adopt in order to prevent the phantasy [*Phantasie*][T] from being fulfilled. When the captain had spoken of this ghastly punishment, he went on, and these ideas had come into his head, by employing his usual formulas (a 'but' accompanied by a gesture of repudiation, and the phrase 'whatever are you thinking of?' ['*Was fällt dir denn ein?*']) he had just succeeded in warding off *both* of them. [Cf. p. 170 below.]

This 'both' took me aback, and it has no doubt also mystified the reader. For so far we have heard of only one idea – of the rat punishment being carried out upon the lady. He was now obliged to admit that a second idea had occurred to him simultaneously, namely, the idea of the punishment also being applied to his father. As his father had died many years previously, this obsessive fear was much more nonsensical even than the first, and accordingly it had attempted to escape being confessed to for a little while longer.

That evening, he continued, the same captain had handed him a [168]
packet that had arrived by the post and had said: 'Lieutenant A.[2] has paid the charges[3] for you. You must pay him back.' The packet had contained the pince-nez that he had wired for. At that instant, however, a 'sanction' had taken shape in his mind, namely, *that he was not to pay back the money* or it would happen – (that is, the phantasy about the rats would come true as regards his father and the lady). And immediately, in accordance with a type of procedure with which he was familiar, to combat this sanction there had arisen a command in the shape of a vow: '*You must pay back the 3.80 Kronen to Lieutenant A*.' He had said these words to himself almost half-aloud.

1 He said 'idea' – the stronger and more significant term 'wish', or rather 'fear', having evidently been censored. Unfortunately I am not able to reproduce the peculiar indeterminateness of all his remarks.

2 The names are of little consequence here. [But see p. 219 *n*. 1 below.]

3 [The charges in question were for the cost of the new pince-nez. In Austria, a system of 'cash on delivery' operated through the post office.]

Two days later the manoeuvres had come to an end. He had spent the whole of the intervening time in efforts at repaying Lieutenant A. the small amount in question; but a succession of difficulties of an apparently *external* nature had arisen to prevent it. First, he had tried to effect the payment through another officer who had been going to the post office. But he had been much relieved when this officer brought him back the money, saying that he had not met Lieutenant A. there, for this method of fulfilling his vow had not satisfied him, as it did not correspond with the wording, which ran: '*You* must pay back the money to Lieutenant A.' Finally, he had met Lieutenant A., the person he was looking for; but that officer had refused to accept the money, declaring that he had not paid anything for him, and had nothing whatever to do with the post, which was the business of Lieutenant B. This had thrown my patient into great perplexity, for it meant that he was unable to keep his vow, since it had been based upon false premises. He had excogitated
[169] a very curious means of getting out of his difficulty, namely, that he should go to the post office with both the men, A. and B., that A. should give the young lady there the 3.80 Kronen, that the young lady should give them to B., and that then he himself should pay back the 3.80 Kronen to A. according to the wording of his vow.

It would not surprise me to hear that at this point the reader had ceased to be able to follow. For even the detailed account which the patient gave me of the external events of these days and of his reactions to them was full of self-contradictions and sounded hopelessly confused. It was only when he told the story for the third time that I could get him to realize its obscurities and could lay bare the errors of memory and the displacements [*Verschiebungen*][T] in which he had become involved. I shall spare myself the trouble of reproducing these details, the essentials of which we shall easily be able to pick up later on, and I will add only that at the end of this second session the patient behaved as though he were dazed and bewildered. He repeatedly addressed me as 'Captain', probably because at the beginning of the hour I had told him that I myself was not fond of cruelty like Captain N., and that I had no intention of tormenting him unnecessarily.

The only other piece of information that I obtained from him during this hour was that from the very first, on all the previous occasions on which he had had a fear that something would happen to people he loved no less than on the present one, he had referred the punishments not only to our present life but also to eternity – to the next world. Up to his fourteenth or fifteenth year he had been devoutly religious, but from

that time on he had gradually developed into the free-thinker that he was today. He reconciled the contradiction [between his beliefs and his obsessions] by saying to himself: 'What do you know about the next world? What do the others know about it? Nothing *can* be known about it. You're not risking anything – so do it.' This form of argument seemed unobjectionable to a man who was in other respects particularly clear- [170]
headed, and in this way he exploited the uncertainty of reason in the face of these questions to the benefit of the religious attitude which he had outgrown.

At the third session he completed his very characteristic story of his efforts at fulfilling his obsessional vow. That evening the last gathering of officers had taken place before the end of the manoeuvres. It had fallen to him to reply to the toast of 'The Gentlemen of the Reserve'. He had spoken well, but as if he were in a dream, for at the back of his mind he was being incessantly tormented by his vow. He had spent a terrible night. Arguments and counterarguments had struggled with one another. The chief argument, of course, had been that the premise upon which his vow had been based – that Lieutenant A. had paid the money for him – had proved to be false. However, he had consoled himself with the thought that the business was not yet finished, as A. would be riding with him next morning part of the way to the railway station at P—— [Przemyśl], so that he would still have time to ask him the necessary favour.[1] As a matter of fact he had not done this, and had allowed A. to go off without him; but he had given instructions to his orderly to let A. know that he intended to pay him a visit that afternoon. He himself had reached the station at half-past nine in the morning. He had deposited his luggage there and had seen to various things he had to do in the small town, with the intention of afterwards paying his visit to A. The village in which A. was stationed was about an hour's drive from the town of P——. The railway journey to the place where the post office was [Spas] would take three hours. He had calculated, therefore, that the execu-
tion of his complicated plan would just leave him time to catch the [171]
evening train from P—— to Vienna. The ideas that were struggling within him had been, on the one hand, that he was simply being cowardly and was obviously only trying to save himself the unpleasantness of asking A. to make the sacrifice in question and of cutting a foolish figure before him, and that that was why he was disregarding his vow; and, on the other hand, that it would, on the contrary, be cowardly of

1 [Reference to the sketch-map on p. 162 below may make this paragraph easier to follow.]

him to *fulfil* his vow, since he only wanted to do so in order to be left in peace by his obsessions. When in the course of his deliberations, the patient added, he found the arguments so evenly balanced as these, it was his custom to allow his actions to be decided by chance events as though by the hand of God. When, therefore, a porter at the station had addressed him with the words 'Ten o'clock train, sir?' he had answered 'Yes', and, in fact, had gone off by the ten o'clock train. In this way he had produced a *fait accompli* and felt greatly relieved. He had proceeded to book a seat for luncheon in the restaurant car. At the first station they had stopped at it had suddenly struck him that he still had time to get off, wait for the next down train, travel back on it to P——, drive to the place where Lieutenant A. was quartered, from there make the three-hour train journey with him to the post office, and so forth. It had only been the consideration that he had booked his seat for luncheon with the steward of the restaurant car that had prevented his carrying out this design. He had not abandoned it, however; he had only put off getting off until a later stop. In this way he had struggled through from station to station, till he had reached one at which it had seemed to him impossible to get off because he had relatives living there. He had then determined to travel through to Vienna, to look up his friend there and lay the whole matter before him, and then, after his friend had made his decision, to catch the night train back to P——. When I expressed a doubt whether this would have been feasible, he assured me that he
[172] would have had half an hour to spare between the arrival of the one train and the departure of the other. When he had arrived in Vienna, however, he had failed to find his friend at the restaurant at which he had counted on meeting him, and had not reached his friend's house till eleven o'clock at night. He told him the whole story that very night. His friend had held up his hands in amazement to think that he could still be in doubt whether he was suffering from an obsession, and had calmed him down for the night, so that he had slept excellently. Next morning they had gone together to the post office, to dispatch the 3.80 Kronen to the post office [Spas] at which the packet containing the pince-nez had arrived.

It was this last statement which provided me with a starting point from which I could begin straightening out the various distortions involved in his story. After his friend had brought him to his senses he had dispatched the small sum of money in question neither to Lieutenant A. nor to Lieutenant B., but direct to the post office. He must therefore have known that he owed the amount of the charges due upon the packet *to no-one*

but the official at the post office, and he must have known this before he started on his journey. It turned out that in fact he had known it before the captain made his request and before he himself made his vow; for he now remembered that a few hours *before* meeting the cruel captain he had had occasion to introduce himself to another captain, who had told him how matters actually stood. This officer, on hearing his name, had told him that he had been at the post office a short time before, and that the young lady there had asked him whether he knew a Lieutenant L. (the patient, that is), for whom a packet had arrived, to be paid for on delivery. The officer had replied that he did not, but the young lady had been of the opinion that she could trust the unknown lieutenant and had said that in the meantime she would pay the charges herself. It had been in this way that the patient had come into possession of the pince-nez he had ordered. The cruel captain had made a mistake when, [173]
as he handed him over the packet, he had asked him to pay back the 3.80 Kronen to A., and the patient must have known it was a mistake. In spite of this he had made a vow founded upon this mistake, a vow that was bound to be a torment to him. In so doing he had suppressed to himself, just as in telling the story he had suppressed to me, the episode of the other captain and the existence of the trusting young lady at the post office. I must admit that when this correction has been made his behaviour becomes even more senseless and unintelligible than before.

After he had left his friend and returned to his family his doubts had overtaken him afresh. His friend's arguments, he saw, had been no different from his own, and he was under no delusion that his temporary relief was attributable to anything more than his friend's personal influence. His determination to consult a doctor was woven into his delirium in the following ingenious manner. He thought he would get a doctor to give him a certificate to the effect that it was necessary for him, in order to recover his health, to perform some such action as he had planned in connection with Lieutenant A.; and the lieutenant would no doubt let himself be persuaded by the certificate into accepting the 3.80 crowns from him. The chance that one of my books happened to fall into his hands just at that moment directed his choice to me. There was no question of getting a certificate from me, however; all that he asked of me was, very reasonably, to be freed of his obsessions. Many months later, when his resistance was at its height, he once more felt a temptation to travel to P—— after all, to look up Lieutenant A. and to go through the farce of returning him the money.

(D) INITIATION INTO THE NATURE OF THE TREATMENT

The reader must not expect to hear at once what light I have to throw
[174] upon the patient's strange and senseless obsessions about the rats. The true technique of psychoanalysis requires the physician to suppress his curiosity and leaves the patient complete freedom in choosing the order in which topics shall succeed each other during the treatment. At the fourth session, accordingly, I received the patient with the question: 'And how do you intend to proceed today?'

'I have decided to tell you something which I consider most important and which has tormented me from the very first.' He then told me at great length the story of the last illness of his father, who had died of emphysema nine years previously.[1] One evening, thinking that the condition was one which would come to a crisis, he had asked the doctor when the danger could be regarded as over. 'The evening of the day after tomorrow', had been the reply. It had never entered his head that his father might not survive that limit. At half-past eleven at night he had lain down for an hour's rest. He had woken up at one o'clock, and had been told by a medical friend that his father had died. He had reproached himself with not having been present at his death; and the reproach had been intensified when the nurse told him that his father had spoken his name once during the last days, and had said to her as she came up to the bed: 'Is that Paul?' He had thought he noticed that his mother and sisters had been inclined to reproach themselves in a similar way; but they had never spoken about it. At first, however, the reproach had not tormented him. For a long time he had not realized the fact of his father's death. It had constantly happened that, when he heard a good joke, he would say to himself: 'I must tell Father that.' His imagination, too, had been occupied with his father, so that often, when there was a knock at the door, he would think: 'Here comes Father', and when he walked into a room he would expect to find his father in it. And although he had never forgotten that his father was dead, the prospect of seeing a ghostly apparition
[175] of this kind had had no terrors for him; on the contrary, he had greatly desired it. It had not been until eighteen months later that the recollection of his neglect had recurred to him and begun to torment him terribly, so that he had come to treat himself as a criminal. The occasion of this happening had been the death of an aunt by marriage and of a visit of condolence that he had paid at her house. From that time forward he had extended the structure of his obsessional thoughts so as to include the

1 [The 'Rat Man's' father actually died on July 20, 1899, i.e. eight years previously.]

next world. The immediate consequence of this development had been that he became seriously incapacitated from working.[1] He told me that the only thing that had kept him going at that time had been the consolation given him by his friend, who had always brushed his self-reproaches aside on the ground that they were grossly exaggerated. Hearing this, I took the opportunity of giving him a first glance at the underlying principles of psychoanalytic therapy. When there is a *mésalliance*,[2] I began, between an affect and its ideational content (in this instance, between the intensity of the self-reproach and the occasion for it), a layman will say that the affect is too great for the occasion – that it is exaggerated – and that consequently the inference following from the self-reproach (the inference that the patient is a criminal) is false. On the contrary, the [analytic] physician says: 'No. The affect is justified. The sense of guilt is not in itself open to further criticism. But it belongs to some other content, which is unknown (*unconscious*), and which needs to be looked for. The known ideational content has only got into its actual position owing to a false connection. We are not used to feeling strong affects without their having any ideational content, and therefore, if the content is missing, we seize as a substitute upon some other content which is in some way or other suitable, much as our police, when they cannot catch the right murderer, arrest a wrong one instead. Moreover, this fact of there being a false connection is the only way of accounting for the powerlessness of logical processes to combat the tormenting idea.' I concluded by admitting that this new way of looking at the matter gave immediate rise to some hard problems; for how could he admit that his self-reproach of being a criminal towards his father was justified, when he must know that as a matter of fact he had never committed any crime against him? [176]

At the next session the patient showed great interest in what I had said, but ventured, so he told me, to bring forward a few doubts. – How, he asked, could the information that the self-reproach, the sense of guilt, was justified have a therapeutic effect? – I explained that it was not the

1 A more detailed description of the episode, which the patient gave me later on, made it possible to understand the effect that it produced on him. His uncle, lamenting the loss of his wife, had exclaimed: 'Other men allow themselves every possible indulgence, but I lived for this woman alone!' The patient had assumed that his uncle was alluding to his father and was casting doubts upon his conjugal fidelity; and although his uncle had denied this construction of his words most positively, it was no longer possible to counteract their effect.

2 [The following account of displacement of affect is closely modelled on the one given in Freud's first paper on 'The Neuropsychoses of Defence' (1894*a*), Section II, where the term 'false connection' is used in the same special sense as in the passage below. Cf. *RSE*, **3**, 48 f.]

information that had this effect, but the discovery of the unknown content to which the self-reproach was really attached. – Yes, he said, that was the precise point to which his question had been directed. – I then made some short observations upon *the psychological differences between the conscious and the unconscious*, and upon the fact that everything conscious was subject to a process of wearing away, while what was unconscious was relatively unchangeable; and I illustrated my remarks by pointing to the antiques standing about in my room. They were, in fact, I said, only objects found in a tomb, and their burial had been their preservation: the destruction of Pompeii was only beginning
[177] now that it had been dug up. – Was there any guarantee, he next enquired, of what one's attitude would be towards what was discovered? One man, he thought, would no doubt behave in such a way as to get the better of his self-reproach, but another would not. – No, I said, it followed from the nature of the circumstances that in every case the affect would be overcome – for the most part during the progress of the work itself. Every effort was made to preserve Pompeii, whereas people were anxious to be rid of tormenting ideas like his. – He had said to himself, he went on, that a self-reproach could only arise from a breach of a person's own inner moral principles and not from that of any external ones. – I agreed, and said that the man who merely breaks an external law often regards himself as a hero. – Such an occurrence, he continued, was thus only possible where a *disintegration of the personality* was already present. Was there a possibility of his effecting a reintegration of his personality? If this could be done, he thought he would be able to make a success of his life, perhaps more of one than most people. – I replied that I was in complete agreement with this notion of a splitting of his personality. He had only to assimilate this new contrast, between a moral self and an evil one, with the contrast I had already mentioned, between the conscious and the unconscious. The moral self was the conscious, the evil self was the unconscious.[1] – He then said that, though he considered himself a moral person, he could quite definitely remember having done things in his *childhood* which came from his other self. I remarked that here he had incidentally hit upon one of the chief characteristics of the unconscious, namely, its relation to the *infantile*. The unconscious, I explained, *was* the infantile; it was that part of the self which had become separated off from it in infancy, which had not shared the later stages of its development, and

1 All of this is of course only true in the roughest way, but it serves as a first introduction to the subject.

which had in consequence become *repressed*. It was the derivatives of this repressed unconscious that were responsible for the involuntary [178] thoughts which constituted his illness. He might now, I added, discover yet another characteristic of the unconscious; it was a discovery which I should be glad to let him make for himself. – He found nothing more to say in this immediate connection, but instead he expressed a doubt whether it was possible to undo modifications of such long standing. What, in particular, could be done against his idea about the next world, for it could not be refuted by logic? – I told him I did not dispute the gravity of his case nor the significance of his pathological constructions; but at the same time his youth was very much in his favour as well as the intactness of his personality. In this connection I said a word or two upon the good opinion[t] I had formed of him, and this gave him visible pleasure.

At the next session he began by saying that he must tell me an event in his childhood. From the age of seven, as he had already told me [p. 125 above], he had had a fear that his parents guessed his thoughts, and this fear had in fact persisted all through his life. When he was twelve years old he had been in love with a little girl, the sister of a friend of his. (In answer to a question he said that his love had not been sensual; he had not wanted to see her naked for she was too small.) But she had not shown him as much affection as he had desired. And thereupon the idea had come to him that she would be kind to him if some misfortune were to befall him; and as an instance of such a misfortune his father's death had forced itself upon his mind. He had at once rejected the idea with energy. And even now he could not admit the possibility that what had arisen in this way could have been a 'wish'; it had clearly been no more than a 'train of thought'.[1] – By way of objection I asked him why, if it had not been a wish, he had repudiated it. – Merely, he replied, on account of [179] the content of the idea, the notion that his father might die. – I remarked that he was treating the phrase as though it were one that involved *lèse-majesté*; it was well known, of course, that it was equally punishable to say 'The Emperor is an ass' or to disguise the forbidden words by saying 'If anyone says, etc., . . . then he will have me to reckon with.' I added that I could easily insert the idea which he had so energetically repudiated into a context which would exclude the possibility of any such repudiation: for instance, 'If my father dies, I shall kill myself upon his grave.' – He was shaken, but did not abandon his objection. I therefore

1 Obsessional neurotics are not the only people who are satisfied with euphemisms of this kind.

broke off the argument with the remark that I felt sure this had not been the first occurrence of his idea of his father's dying; it had evidently originated at an earlier date, and some day we should have to trace back its history. – He then proceeded to tell me that a very similar thought had flashed through his mind a second time, six months before his father's death. At that time[1] he had already been in love with his lady, but financial obstacles made it impossible to think of an alliance with her. The idea had then occurred to him that *his father's death might make him rich enough to marry her*. In defending himself against this idea he had gone to the length of wishing that his father might leave him nothing at all, so that he might have no compensation for his terrible loss. The same idea, though in a much milder form, had come to him for a third time, on the day before his father's death. He had then thought: 'Now I may be going to lose what I love most'; and then had come the contradiction: 'No, there is someone else whose loss would be even more painful to you.'[2] These thoughts surprised him very much, for he was quite certain that his
[180] father's death could never have been an object of his desire but only of his fear. – After his forcible enunciation of these words I thought it advisable to bring a fresh piece of theory to his notice. According to psychoanalytic theory, I told him, every fear corresponded to a former wish which was now repressed; we were therefore obliged to believe the exact contrary of what he had asserted. This would also fit in with another theoretical requirement, namely, that the unconscious must be the precise contrary of the conscious. – He was much agitated at this and very incredulous. He wondered how he could possibly have had such a wish, considering that he loved his father more than anyone else in the world; there could be no doubt that he would have renounced all his own prospects of happiness if by so doing he could have saved his father's life. – I answered that it was precisely such intense love as his that was the necessary precondition of the repressed hatred. In the case of people to whom he felt indifferent he would certainly have no difficulty in maintaining side by side inclinations to a moderate liking and to an equally moderate dislike: supposing, for instance, that he were an official, he might think that his chief was agreeable as a superior, but at the same time pettifogging as a lawyer and inhuman as a judge. (Shakespeare makes Brutus speak in a similar way of Julius Caesar: 'As Caesar loved me, I weep for him; as he was fortunate, I rejoice at it; as he was valiant,

1 That is, ten years ago. [Actually, nine years ago; cf. p. 134 *n.* above.]

2 There is here an unmistakable indication of an opposition between the two objects of his love, his father and the 'lady'.

I honour him; but, as he was ambitious, I slew him.'[1] But these words already strike us as rather strange, and for the very reason that we had imagined Brutus's feeling for Caesar as something deeper.) In the case of someone who was closer to him, of his wife for instance, he would wish his feelings to be unmixed, and consequently, as was only human, he would overlook her faults, since they might make him dislike her – he [181] would ignore them as though he were blind to them. So it was precisely the intensity of his love that would not allow his hatred – though to give it such a name was to caricature the feeling – to remain conscious. To be sure, the hatred must have a source, and to discover that source was certainly a problem; his own statements pointed to the time when he was afraid that his parents guessed his thoughts. On the other hand, too, it might be asked why this intense love of his had not succeeded in extinguishing his hatred, as usually happened where there were two opposing impulses. We could only presume that the hatred must flow from some source, must be connected with some particular cause, which made it indestructible. On the one hand, then, some connection of this sort must be keeping his hatred for his father alive, while on the other hand, his intense love prevented it from becoming conscious. Therefore nothing remained for it but to exist in the unconscious, though it was able from time to time to flash out for a moment into consciousness.

He admitted that all of this sounded quite plausible, but he was naturally not in the very least convinced by it.[2] He would venture to ask, he said, how it was that an idea of this kind could have remissions, how it could appear for a moment when he was twelve years old, and again when he was twenty, and then once more two years later, this time for good. He could not believe that his hostility had been extinguished in the intervals, and yet during them there had been no sign of self-reproaches. – To this I replied that whenever anyone asked a question like that, he was already prepared with an answer; he needed only to be encouraged to go on talking. – He then proceeded, somewhat disconnectedly as it [182] seemed, to say that he had been his father's best friend, and that his father had been his. Except on a few subjects, upon which fathers and sons usually hold aloof from one another – (What could he mean by

1 [These same words from *Julius Caesar* (Act III, Scene 2) played an important part in the associations to one of Freud's own dreams. Cf. *The Interpretation of Dreams* (1900*a*), Chapter VI, Section F; *RSE*, **5**, 378–9.]

2 It is never the aim of discussions like this to create conviction. They are intended only to bring the repressed complexes into consciousness, to set the conflict going in the field of conscious mental activity, and to facilitate the emergence of fresh material from the unconscious. A sense of conviction is attained only after the patient has himself worked over the reclaimed material, and so long as he is not fully convinced the material must be considered as unexhausted.

that?) – there had been a greater intimacy between them than there now was between him and his best friend. As regards the lady for whose sake he had sacrificed his father in that idea of his, it was true that he had loved her very much, but he had never felt really sensual wishes towards her, such as he had constantly had in his childhood. Altogether, in his childhood his sensual impulses had been much stronger than during his puberty. – At this I told him I thought he had now produced the answer we were waiting for, and had at the same time discovered the third great characteristic of the unconscious [p. 137 above]. The source from which his hostility to his father derived its indestructibility was evidently something in the nature of *sensual desires*, and in that connection he must have felt his father as in some way or other an *interference*. A conflict of this kind, I added, between sensuality and childish love was entirely typical. The remissions he had spoken of had occurred because the premature explosion of his sensual feelings had had as its immediate consequence a considerable diminution of their violence. It was not until he was once more seized with intense erotic desires that his hostility reappeared again owing to the revival of the old situation. I then got him to agree that I had not led him on to the subject either of childhood or of sex, but that he had raised them both of his own free will. – He then went on to ask why he had not simply come to a decision, at the time he was in love with the lady, that his father's interference with that love could not for a moment weigh against his love of his father. – I replied that it was scarcely possible to destroy a person *in absentia*. Such a decision would only have been possible if the wish that he took objection to had made its
[183] first appearance on that occasion; whereas, as a matter of fact, it was *a long-repressed wish*, towards which he could not behave otherwise than he had formerly done, and which was consequently immune from destruction. This wish (to get rid of his father as being an interference) must have originated at a time when circumstances had been very different – at a time, perhaps, when he had not loved his father more than the person whom he desired sensually, or when he was incapable of making a clear decision. It must have been in his very early childhood, therefore, before he had reached the age of six, and before the date at which his memory became continuous; and things must have remained in the same state ever since. – With this piece of construction our discussion was broken off for the time being. [Cf. p. 156 f. below.]

At the next session, which was the seventh, he took up the same subject once more. He could not believe, he said, that he had ever entertained

such a wish against his father. He remembered a story of Sudermann's, he went on, that had made a deep impression upon him. In this story[1] there was a woman who, as she sat by her sister's sick-bed, felt a wish that her sister should die so that she herself might marry her husband. The woman thereupon committed suicide, thinking she was not fit to live after being guilty of such baseness. He could understand this, he said, and it would be only right if his thoughts were the death of him, for he deserved nothing less.[2] – I remarked that it was well known to us that patients derived a certain satisfaction from their sufferings, so that in reality they all resisted their own recovery to some extent. He must [184] never lose sight of the fact that a treatment like ours proceeded to the accompaniment of a *constant resistance*; I should be repeatedly reminding him of this fact.

He then went on to say that he would like to speak of a criminal act, whose author he did not recognize as himself, though he quite clearly recollected committing it. He quoted a saying of Nietzsche's:[3] '"I did this," says my Memory. "I cannot have done this," says my Pride and remains inexorable. In the end – Memory yields.' 'Well,' he continued, 'my memory has *not* yielded on this point.' – 'That is because you derive pleasure from your self-reproaches as a means of self-punishment.' – 'My younger brother – I am really very fond of him now, and he is causing me a great deal of worry just at present, for he wants to make what I consider a preposterous match; I have thought before now of going and killing the person concerned so as to prevent his marrying her – well, my younger brother and I used to fight a lot when we were children. We were very fond of each other at the same time, and were inseparable; but I was plainly filled with jealousy, as he was the stronger and better-looking of the two and consequently the favourite.' – 'Yes. You have already given me a description of a scene of jealousy in connection with Fräulein Lina [p. 124 above].' – 'Very well then, on some such occasion (it was certainly before I was eight years old, for I was not going to school yet, which I began to do when I was eight) – on some such occasion, this is what I did. We both had toy guns of the usual make. I loaded mine with the ramrod and told him that if he looked up the barrel he

1 [Sudermann's novel *Geschwister*.]

2 This sense of guilt involves the most glaring contradiction of his opening: 'No', he had never entertained such an evil wish against his father. This is a common type of reaction to repressed material which has become conscious: the 'No' with which the fact is first met is immediately followed by a confirmation of it, though, to begin with, only an indirect one. [Cf. Freud's much later paper on 'Negation' (1925*h*), *RSE*, **19**, 237 ff., and the first two sections of his 'Constructions in Analysis' (1937*d*), ibid., **23**, 233 ff.]

3 *Jenseits von Gut und Böse*, iv. 68.

would see something. Then, while he was looking in, I pulled the trigger. He was hit on the forehead and not hurt; but I had meant to hurt him very much indeed. Afterwards I was quite beside myself, and threw myself on the ground and asked myself how ever I could have done such
[185] a thing. But I *did* do it.' – I took the opportunity of urging my case. If he had preserved the recollection of an action so foreign to him as this, he could not, I maintained, deny the possibility of something similar, which he had now forgotten entirely, having happened at a still earlier age in relation to his father. – He then told me he was aware of having felt other vindictive impulses, this time towards the lady he admired so much, of whose character he painted a glowing picture. It might be true, he said, that she could not love easily; but she was reserving her whole self for the one man to whom she would some day belong. She did not love him. When he had become certain of that, a conscious phantasy had taken shape in his mind of how he should grow very rich and marry someone else, and should then take her to call on the lady in order to hurt her feelings. But at that point the phantasy had broken down, for he had been obliged to own to himself that the other woman, his wife, was completely indifferent to him; then his thoughts had become confused, till finally it had been clearly borne in upon him that this other woman would have to die. In this phantasy, just as in his attempt upon his brother, he recognized the quality of *cowardice* which was so particularly horrible to him.[1] – In the further course of our conversation I pointed out to him that he ought logically to consider himself as in no way responsible for any of these traits in his character; for all of these reprehensible impulses originated from his infancy, and were only derivatives of his infantile character surviving in his unconscious; and he must know that moral responsibility could not be applied to children. It was only by a process of development, I added, that a man, with his moral responsibility, grew up out of the sum of his infantile dispositions.[2] He expressed a doubt,
[186] however, whether all his evil impulses had originated from that source. But I promised to prove it to him in the course of the treatment.

He went on to adduce the fact of his illness having become so enormously intensified since his father's death; and I said I agreed with him insofar as I regarded his sorrow at his father's death as the chief source of the *intensity* of his illness. His sorrow had found, as it were, a pathological expression in his illness. Whereas, I told him, a normal period of

1 This quality of his will find an explanation later on. [See p. 157 below.]

2 I only produced these arguments so as once more to demonstrate to myself their inefficacy. I cannot understand how other psychotherapists can assert that they successfully combat neuroses with such weapons as these.

mourning would last from one to two years, a pathological one like this would last indefinitely.

This is as much of the present case history as I am able to report in a detailed and consecutive manner. It coincides roughly with the expository portion of the treatment; this lasted in all for more than eleven months.[1]

(E) SOME OBSESSIONAL IDEAS AND THEIR EXPLANATION[t]

Obsessional ideas, as is well known, have an appearance of being either without motive [*unmotiviert*] or without meaning, just as dreams have. The first problem is how to give them a sense and a status in the subject's mental life [*Seelenleben*][T], so as to make them comprehensible and even *Seele*
obvious. The problem of translating [*Übersetzung*][T] them may seem insoluble; but we must never let ourselves be misled by that illusion. The wildest and most eccentric obsessional ideas can be cleared up if they are investigated deeply enough. The solution is effected by bringing the obsessional ideas into temporal relationship with the patient's experiences, that is to say, by enquiring when a particular obsessional idea made its first appearance and in what external circumstances it is apt to recur. When, as so often happens, an obsessional idea has not succeeded in establishing itself permanently, the task of clearing it up is correspondingly simplified. We can easily convince ourselves that, when once the interconnections between an obsessional idea and the patient's experi- [187]
ences have been discovered, there will be no difficulty in obtaining access to whatever else may be puzzling or worth knowing in the pathological structure we are dealing with – its meaning, the mechanism of its origin, and its derivation from the preponderant driving forces [*Triebkräften*][T] of the patient's mind.

As a particularly clear example I will begin with one of the *suicidal impulses* which appeared so frequently in our patient. This instance almost analysed itself in the telling. He had once, he told me, lost some weeks of study owing to his lady's absence: she had gone away to nurse her grandmother, who was seriously ill. Just as he was in the middle of a very hard piece of work the idea had occurred to him: 'If you received a command to take your examination this term at the first possible

1 [Actually the treatment appears to have lasted for nine and a half months. It began on October 1, 1907, and must have ended before Freud left Vienna for his summer holiday on July 15, 1908 – by which time the 'Rat Man' was in full-time employment.]

opportunity, you might manage to obey it. But if you were commanded to cut your throat with a razor, what then?' He had at once become aware that this command had already been given, and was hurrying to the cupboard to fetch his razor when he thought: 'No, it's not so simple as that. You must[1] go and kill the old woman.' Upon that, he had fallen to the ground, beside himself with horror.

In this instance the connection between the compulsive idea and the patient's life is contained in the opening words of his story. His lady was absent, while he was working very hard for an examination so as to bring the possibility of an alliance with her nearer. While he was working he was overcome by a longing for his absent lady, and he thought of the cause of her absence. And now there came over him something which, if he had been a normal man, would probably have been some kind of feeling of annoyance with her grandmother: 'Why must the old woman get ill just at the very moment when I'm longing for *her* so frightfully?' We
[188] must suppose that something similar but far more intense passed through our patient's mind – an unconscious fit of rage which could combine with his longing and find expression in the exclamation: 'Oh, I should like to go and kill that old woman for robbing me of my love!' Thereupon followed the command: 'Kill yourself, as a punishment for these savage and murderous passions!' The whole process then passed into the obsessional patient's consciousness accompanied by the most violent affect and *in a reverse order* – the punitive command coming first, and the mention of the guilty outburst afterwards. I cannot think that this attempt at an explanation will seem forced or that it involves many hypothetical elements.

Another impulse, which might be described as *indirectly* suicidal and which was of longer duration, was not so easily explicable. For its relation to the patient's experiences succeeded in concealing itself behind one of those purely external associations which are so obnoxious to our consciousness. One day while he was away on his summer holidays the idea suddenly occurred to him that he was too fat [German '*dick*'] and that he must *make himself slimmer*. So he began getting up from table before the pudding came round and tearing along the road without a hat in the blazing heat of an August sun. Then he would dash up a mountain at the double, till, dripping with perspiration, he was forced to come to a stop. On one occasion his suicidal intentions actually emerged without any disguise from behind this mania for slimming: as he was standing on

1 The sense requires that the word 'first' should be interpolated here.

the edge of a steep precipice he suddenly received a command to jump over, which would have been certain death. Our patient could think of no explanation for this senseless obsessional behaviour until it suddenly occurred to him that at that time his lady had also been stopping at the same resort; but she had been in the company of an English cousin, who was very attentive to her and of whom the patient had been very jealous. This cousin's name was Richard, and, according to the usual practice in England, he was known as *Dick*.[1] Our patient, then, had wanted to kill this Dick; he had been far more jealous of him and enraged with [189] him than he could admit to himself, and that was why he had imposed on himself this course of slimming by way of a punishment. This obsessional impulse may seem very different from the directly suicidal command which was discussed above, but they have nevertheless one important feature in common. For they both arose as reactions to a tremendous feeling of rage, which was inaccessible to the patient's consciousness and was directed against someone who had cropped up as an interference with the course of his love.[2]

Some other of the patient's obsessions, however, though they too were centred upon his lady, exhibited a different mechanism and owed their origin to a different drive. Besides his slimming mania he produced a whole series of other obsessional activities at the period during which the lady was stopping at his summer resort; and, in part at least, these directly related to her. One day, when he was out with her in a boat and there was a stiff breeze blowing, he was obliged to make her put on his cap, because a command had been formulated in his mind that *nothing must happen to her*.[3] This was a kind of *obsession for protecting*, and it bore other fruit besides this. Another time, as they were sitting together during a thunderstorm, he was obsessed, he could not tell why, with the *necessity for counting* up to forty or fifty between each flash of lightning [190] and its accompanying thunder-clap. On the day of her departure he knocked his foot against a stone lying in the road, and was *obliged* to put it out of the way by the side of the road, because the idea struck him that

1 [Richard (who was actually Gisela's *uncle*) was visiting from New York – where, of course, the same practice applies.]

2 Names and words are not nearly so frequently or so recklessly employed in obsessional neuroses as in hysteria for the purpose of establishing a connection between unconscious thoughts (whether they are impulses or phantasies) and symptoms. I happen, however, to recollect another instance in which the very same name, Richard, was similarly used by a patient whom I analysed a long time since. After a quarrel with his brother he began brooding over the best means of getting rid of his fortune, and declaring that he did not want to have anything more to do with money, and so on. His brother was called Richard, and '*richard*' is the French for 'a rich man'.

3 The words 'for which he might be to blame' must be added to complete the sense.

her carriage would be driving along the same road in a few hours' time and might come to grief against this stone. But a few minutes later it occurred to him that this was absurd, and he was *obliged* to go back and replace the stone in its original position in the middle of the road. After her departure he became a prey to an *obsession for understanding*, which made him a curse to all his companions. He forced himself to understand the precise meaning of every syllable that was addressed to him, as though he might otherwise be missing some priceless treasure. Accordingly he kept asking: 'What was it you said just then?' And after it had been repeated to him he could not help thinking it had sounded different the first time, so he remained dissatisfied.

All of these products of his illness depended upon a certain circumstance which at that time dominated his relations to his lady. When he had been taking leave of her in Vienna before the summer holidays, she had said something which he had construed into a desire on her part to
Verleugnung disown [*verleugnen*][T] him before the rest of the company; and this had made him very unhappy. During her stay at the holiday resort there had been an opportunity for discussing the question, and the lady had been able to prove to him that these words of hers which he had misunderstood had on the contrary been intended to save him from looking ridiculous. This made him very happy again. The clearest allusion to this incident was contained in the obsession for understanding. It was constructed as though he were saying to himself: 'After such an experience you must never misunderstand anyone again, if you want to spare yourself unnecessary distress.' This resolution was not merely a generalization from a single occasion, but it was also displaced – perhaps
[191] on account of the lady's absence – from a single highly valued individual on to all the remaining inferior ones. And the obsession cannot have arisen solely from his satisfaction at the explanation she had given him; it must have expressed something else besides, for it ended in an unsatisfying doubt as to whether what he had heard had been correctly repeated.

The other compulsive commands that have been mentioned put us upon the track of this other element. His obsession for protecting can only have been a reaction – as an expression of remorse and penitence – to a contrary, that is a hostile, impulse which he must have felt towards his lady before they had their *éclaircissement*. His obsession for counting during the thunderstorm can be interpreted, with the help of some material which he produced, as having been a defensive measure against fears that someone was in danger of death. The analysis of the obsessions

which we first considered has already warned us to regard our patient's hostile impulses as particularly violent and as being in the nature of senseless rage; and now we find that even after their reconciliation his rage against the lady continued to play a part in the formation of his obsessions. His doubting mania as to whether he had heard correctly was an expression of the doubt still lurking in his mind, whether he had really understood his lady correctly this time and whether he had been justified in taking her words as a proof of her affection for him. The doubt implied in his obsession for understanding was a doubt of her love. A battle between love and hate was raging in the lover's breast, and the object of both these feelings was one and the same person. The battle was represented in a plastic form by his compulsive and symbolic act of removing the stone from the road along which she was to drive, and then of undoing this deed of love by replacing the stone where it had lain, so that her carriage might come to grief against it and she herself be hurt. We shall not be forming a correct judgement of this second part of the compulsive act if we take it at its face value as having merely been a critical repudi- [192]
ation of a pathological action. The fact that it was accompanied by a sense of compulsion betrays it as having itself been a part of the pathological action, though a part which was determined by a motive contrary to that which produced the first part.

Compulsive acts like this, in two successive stages, of which the second neutralizes [*aufgehoben*][t] the first, are a typical occurrence in obsessional neuroses. The patient's consciousness naturally misunderstands them and puts forward a set of secondary motives to account for them – *rationalizes* them, in short. (Cf. Jones, 1908.) But their true significance lies in their being a representation of a conflict between two opposing impulses of approximately equal strength: and hitherto I have invariably found that this opposition has been one between love and hate. Compulsive acts of this sort are theoretically of special interest, for they show us a new type of method of constructing symptoms. What regularly occurs in hysteria is that a compromise is arrived at which enables both the opposing tendencies to find expression simultaneously – which kills two birds with one stone;[1] whereas here each of the two opposing tendencies finds satisfaction singly, first one and then the other, though naturally an attempt is made to establish some sort of logical connection (often in defiance of all logic) between the antagonists.[2]

1 Cf. 'Hysterical Phantasies and their Relation to Bisexuality' (Freud, 1908*a*) [*RSE*, **9**, 137 ff.].

2 Another obsessional patient once told me the following story. He was walking one day in the park at Schönbrunn [see footnote 1, p. 8 above] when he kicked his foot against a branch that was lying on the ground. He picked it up and flung it into the hedge that bordered the path. On his

[193] The conflict between love and hatred showed itself in our patient by other signs as well. At the time of the revival of his piety [pp. 130 f. above and 226 below] he made up prayers for himself, which took up more and more time and eventually lasted for an hour and a half. The reason for this was that he found, like an inverted Balaam, that something always inserted itself into his pious phrases and turned them into their opposite. [Cf. p. 196 *n*.] E.g., if he said, 'May God protect them', an evil spirit would hurriedly insinuate a 'not'.[1] On one such occasion the idea occurred to him of cursing instead, for in that case, he thought, the contrary words would be sure to creep in. His original intention, which had been repressed by his praying, was forcing its way through in this last idea of his. In the end he found his way out of his embarrassment by giving up the prayers and replacing them with a short formula concocted out of the initial letters or syllables of various prayers. He then recited this formula so quickly that nothing could slip into it. [See p. 171.]

He once brought me a dream which represented the same conflict in relation to his transference on to the physician. He dreamt that my mother was dead; he was anxious to offer me his condolences, but was afraid that in doing so he might break into *an impertinent laugh*, as he had repeatedly done on similar occasions in the past. He preferred, therefore, to leave a card for me with 'p. c.' written on it; but as he was writing them the letters turned into 'p. f.'.[2]

[194] The mutual antagonism between his feelings for his lady was too marked to have escaped his conscious perception entirely, although we may conclude from the obsessions in which it was manifested that he did not rightly appreciate the depth of his negative impulses [*Regungen*][T]. The lady had refused his first proposal, ten years earlier. Since then he had to his own knowledge passed through alternating periods, in which he either believed that he loved her intensely, or felt indifferent to her. Whenever in the course of the treatment he was faced

way home he was suddenly seized with uneasiness that the branch in its new position might perhaps be projecting a little from the hedge and might cause an injury to someone passing by the same place after him. He was obliged to jump off his tram, hurry back to the park, find the place again, and put the branch back in its former position – although anyone else but the patient would have seen that, on the contrary, it was bound to be more dangerous to passers-by in its original position than where he had put it in the hedge. The second and hostile act, which he carried out under compulsion, had clothed itself to his conscious view with the motives that really belonged to the first and philanthropic one.

1 Compare the similar mechanism in the familiar case of sacrilegious thoughts entering the minds of devout persons.

2 [The customary abbreviations for '*pour condoler*' and '*pour féliciter*', respectively.] This dream provides the explanation of the compulsive laughter which so often occurs on mournful occasions and which is regarded as such an unaccountable phenomenon.

with the necessity of taking some step which would bring him nearer the successful end of his courtship, his resistance usually began by taking the form of a conviction that after all he did not very much care for her – though this resistance, it is true, used soon to break down. Once when she was lying seriously ill in bed and he was most deeply concerned about her, there crossed his mind as he looked at her a wish that she might lie like that for ever. He explained this idea by an ingenious piece of sophistry: maintaining that he had wished her to be permanently ill only so that he might be relieved of his intolerable fear that she would have a repeated succession of attacks![1] Now and then he used to occupy his imagination with daydreams, which he himself recognized as 'phantasies of revenge' and felt ashamed of. Believing, for instance, that the lady set great store by the social standing of a suitor, he made up a phantasy in which she was married to a man of that kind, who was in some government office. He himself then entered the same department, and rose much more rapidly than her husband, who eventually became his subordinate. One day, his phantasy proceeded, this man committed some act of dishonesty. The lady threw herself at his feet and implored him to save her husband. He promised to do so, and informed her that it had only been for love of her that he had entered the service, because he [195] had foreseen that such a moment would occur; and now that her husband was saved, his own mission was fulfilled and he would resign his post.

He produced other phantasies in which he did the lady some great service without her knowing that it was he who was doing it. In these he only recognized his affection, without sufficiently appreciating the origin and aim of his magnanimity, which was designed to repress his thirst for revenge, after the manner of Dumas' Count of Monte Cristo. Moreover, he admitted that occasionally he was overcome by quite distinct impulses to do some mischief to the lady he admired. These impulses were mostly in abeyance when she was there, and only[t] appeared in her absence.

(F) THE PRECIPITATING CAUSE OF THE ILLNESS

One day the patient mentioned quite casually an event which I could not fail to recognize as the precipitating cause of his illness, or at least as the immediate occasion of the attack which had begun some six years previously and had persisted to that day. He himself had no notion that he had

1 It cannot be doubted that another contributory motive to this compulsive idea was a wish to know that she was powerless against his designs.

brought forward anything of importance; he could not remember that he had ever attached any importance to the event; and moreover he had never forgotten it. Such an attitude on his part calls for some theoretical consideration.

In hysteria it is the rule that the precipitating causes of the illness are overtaken by amnesia no less than the infantile experiences by whose help the precipitating causes are able to transform their affective energy into symptoms. And where the amnesia cannot be complete, it nevertheless subjects the recent traumatic precipitating cause to a process of erosion and robs it at least of its most important components. In this amnesia we see the evidence of the repression which has taken place. The case is different in obsessional neuroses. The infantile preconditions of
[196] the neurosis may be overtaken by amnesia, though this is often an incomplete one; but the immediate occasions of the illness are, on the contrary, retained in the memory. Repression makes use of another, and in reality a simpler, mechanism. The trauma, instead of being forgotten, is deprived
Besetzung of its affective cathexis [*Affektbesetzung*][T]; so that what remains in consciousness is nothing but its ideational content [*Vorstellungsinhalt*], which is perfectly colourless and is judged to be unimportant. The distinction between what occurs in hysteria and in an obsessional neurosis lies in the psychological processes which we can reconstruct behind the phenomena; the *result* is almost always the same, for the colourless mnemic content is rarely reproduced and plays no part in the patient's mental activity. In order to differentiate between the two kinds of repression we have on the surface nothing to rely upon but the patient's assurance that he has a feeling in the one case of having always known the thing and in the other of having long ago forgotten it.[1]

For this reason, it not uncommonly happens that obsessional neurotics, who are troubled with self-reproaches but have connected their affects with the wrong causes, will also tell the physician the true causes, without any suspicion that their self-reproaches have simply become

1 It must therefore be admitted that in an obsessional neurosis there are two kinds of knowledge, and it is just as reasonable to hold that the patient 'knows' his traumas as that he does *not* 'know' them. For he knows them in that he has not forgotten them, and he does not know them in that he is unaware of their significance. It is often the same in ordinary life. The waiters who used to serve Schopenhauer at his regular restaurant 'knew' him in a certain sense, at a time when, apart from that, he was not known either in Frankfurt or outside it; but they did not 'know' him in the sense in which we speak today of 'knowing' Schopenhauer. – [In *Inhibitions, Symptoms and Anxiety* (1926*d*), Chapter XI, A (*c*); *RSE*, **20**, 144 ff., Freud proposed that the term 'repression' should be restricted in its use to the mechanism found at work in hysteria, and he reintroduced the term 'defence' to cover *all* the various techniques employed in dealing with psychical conflicts. He would accordingly have written later '*two kinds of defence*' in the sentence in the text above instead of 'two kinds of repression'.]

detached from them. In relating such an incident they will sometimes [197]
add with astonishment or even with an air of pride: 'But I think nothing of that.' This happened in the first case of obsessional neurosis which gave me an insight many years ago into the nature of the malady. The patient, who was a government official, was troubled by innumerable scruples. He was the man whose compulsive act in connection with the branch in the park at Schönbrunn I have already described [pp. 147–8 *n.* 2 above]. I was struck by the fact that the florin notes with which he paid his consultation fees were invariably clean and smooth. (This was before we had a silver coinage in Austria.) I once remarked to him that one could always tell a government official by the brand-new florins that he drew from the State treasury, and he then informed me that his florins were by no means new, but that he had them ironed out at home. It was a matter of conscience with him, he explained, not to hand anyone dirty paper florins; for they harboured all sorts of dangerous bacteria and might do some harm to the recipient. At that time I already had a vague suspicion of the connection between neuroses and sexual life, so on another occasion I ventured to ask the patient how he stood in regard to that matter. 'Oh, that's quite all right,' he answered airily, 'I'm not at all badly off in that respect. I play the part of a dear old uncle in a number of respectable families, and now and then I make use of my position to invite some young girl to go out with me for a day's excursion in the country. Then I arrange that we shall miss the train home and be obliged to spend the night out of town. I always engage two rooms – I do things most handsomely; but when the girl has gone to bed I go in to her and masturbate her with my fingers.' – 'But aren't you afraid of doing her some harm, fiddling about in her genitals with your dirty hand?' – At this he flared up: 'Harm? Why, what harm should it do her? It hasn't done a single one of them any harm yet, and they've all of them enjoyed it. Some of them are married now, and it hasn't done them any harm at all.' – He [198]
took my remonstrance in very bad part, and never appeared again. But I could only account for the contrast between his fastidiousness with the paper florins and his unscrupulousness in abusing the girls entrusted to him by supposing that the self-reproachful affect had become *displaced*. The aim of this displacement was obvious enough: if his self-reproaches had been allowed to remain where they belonged he would have had to abandon a form of sexual gratification to which he was probably impelled by some powerful infantile determinants. The displacement therefore ensured his deriving a considerable *gain from illness*.[1]

1 [See footnote 1, p. 88 above.]

But I must now return to a more detailed examination of the precipitating cause of our present patient's illness. His mother was brought up in a wealthy family with which she was distantly connected.[1] This family carried on a large industrial concern. His father, at the time of his marriage, had been taken into the business, and had thus by his marriage made himself a fairly comfortable position. The patient had learnt from some chaff exchanged between his parents (whose marriage was an extremely happy one) that his father, some time before making his mother's acquaintance, had made advances to a pretty but penniless girl of humble birth. So much by way of introduction. After his father's death the patient's mother told him one day that she had been discussing his future with her rich relations, and that one of her cousins had declared himself ready to let him marry one of his daughters when his education was completed; a business connection with the firm would offer him a brilliant opening in his profession. This family plan stirred up in him a conflict as to whether he should remain faithful to the lady he loved in spite of her poverty, or whether he should follow in his father's footsteps and marry the lovely, rich and well-connected girl who had been
[199] assigned to him. And he resolved this conflict, which was, in fact, one between his love and the persisting influence of his father's wishes, by falling ill; or, to put it more correctly, by falling ill he avoided the task of resolving it in real life.[2]

The proof that this view was correct lies in the fact that the chief result of his illness was an obstinate incapacity for work, which allowed him to postpone the completion of his education for years. But the results of such an illness are never unintentional; what appears to be the *consequence* of the illness is in reality the *cause* or *motive* [*die Ursache, das Motiv*][T] of falling ill.

As was to be expected, the patient did not, to begin with, accept my elucidation of the matter. He could not imagine, he said, that the plan of marriage could have had any such effects: it had not made the slightest impression on him at the time. But in the further course of treatment he was forcibly brought to believe in the truth of my suspicion, and in a most singular manner. With the help of a transference phantasy, he experienced, as though it were new and belonged to the present, the very episode from the past which he had forgotten, or which had only passed

1 [The 'Rat Man's' mother was adopted by her distant cousins.]

2 It is worth emphasizing that his flight into illness was made possible by his identifying himself with his father. The identification enabled his affects to regress on to the residues of his childhood. [See Section G. – The phrase 'flight into illness' had already been used by Freud in 'Some General Remarks on Hysterical Attacks' (1909*a*), Section B; *RSE*, **9**, 203.]

through his mind unconsciously. There came an obscure and difficult period in the treatment; eventually it turned out that he had once met a young girl on the stairs in my house and had on the spot promoted her into being my daughter. She had pleased him, and he pictured to himself that the only reason I was so kind and incredibly patient with him was that I wanted to have him for a son-in-law. At the same time he raised the wealth and position of my family to a level which agreed with the model he had in mind. But his undying love for his lady fought against the temptation. After we had gone through a series of the severest resistances [200] and bitterest vituperations on his part, he could no longer remain blind to the overwhelming effect of the perfect analogy between the transference phantasy and the actual state of affairs in the past. I will repeat one of the dreams which he had at this period, so as to give an example of his manner of treating the subject. He dreamt that *he saw my daughter in front of him; she had two patches of dung instead of eyes*. No-one who understands the language of dreams will find much difficulty in translating this one: it declared that *he was marrying my daughter not for her 'beaux yeux' but for her money*.

(G) THE FATHER COMPLEX AND THE SOLUTION OF THE RAT IDEA

From the precipitating cause of the patient's illness in his adult years there was a thread leading back to his childhood. He had found himself in a situation similar to that in which, as he knew or suspected, his father had been before *his* marriage; and he had thus been able to identify himself with his father. But his dead father was involved in his recent attack in yet another way. The conflict at the root of his illness was in essentials a struggle between the persisting influence of his father's wishes and his own amatory predilections. If we take into consideration what the patient reported in the course of the first hours of his treatment, we shall not be able to avoid a suspicion that this struggle was a very ancient one and had arisen as far back as in his childhood.

By all accounts our patient's father was a most excellent man. Before his marriage he had been a non-commissioned officer, and, as relics of that period of his life, he had retained a straightforward soldierly manner and a penchant for using downright language. Apart from those virtues which are celebrated upon every tombstone, he was distinguished by a hearty sense of humour and a kindly tolerance towards his fellow men. [201] That he could be hasty and violent was certainly not inconsistent with

his other qualities, but was rather a necessary complement to them; but it occasionally brought down the most severe castigations upon the children, while they were young and naughty. When they grew up, however, he differed from other fathers in not attempting to exalt himself into a sacrosanct authority, but in sharing with them a knowledge of the little failures and misfortunes of his life with good-natured candour. His son was certainly not exaggerating when he declared that they had lived together like the best of friends, except upon a single point (p. 139 f.). And it must no doubt have been in connection with that very point that thoughts about his father's death had occupied his mind when he was a small boy with unusual and undue intensity (p. 125), and that those thoughts made their appearance in the wording of the obsessional ideas of his childhood; and it can only have been in that same connection that he was able to wish for his father's death, in order that a certain little girl's sympathy might be aroused and that she might behave more kindly towards him (p. 137).

There can be no question that there was something in the sphere of sexuality that stood between the father and son, and that the father had come into some sort of opposition to the son's early developed erotic life. Several years after his father's death, the first time he experienced the pleasurable sensations of copulation, an idea sprang into his mind: 'This is glorious! One might murder one's father for this!' This was at once an echo and an elucidation of the obsessional ideas of his childhood. Moreover, his father, shortly before his death, had directly opposed what later became our patient's dominating passion. He had noticed that his son was always in the lady's company, and had advised him to keep away from her, saying that it was imprudent of him and that he would only make a fool of himself.

[202] To this unimpeachable body of evidence we shall be able to add fresh material, if we turn to the history of the masturbatory side of our patient's sexual activities. There is a conflict between the opinions of doctors and patients on this subject which has not hitherto been properly appreciated. The patients are unanimous in their belief that masturbation, by which they mean masturbation *during puberty*, is the root and origin of all their troubles. The doctors are, upon the whole, unable to decide what line to take; but, influenced by the knowledge that not only neurotics but most normal people pass through a period of masturbation during their puberty, the majority of them are inclined to dismiss the patients' assertions as gross exaggerations. In my opinion the patients are once again nearer to a correct view than the doctors; for the patients

have some glimmering notion of the truth, while the doctors are in danger of overlooking an essential point. The thesis propounded by the patients certainly does not correspond to the facts in the sense in which they themselves construe it, namely, that masturbation during puberty (which may almost be described as a typical occurrence) is responsible for all neurotic disturbances. Their thesis requires interpretation. The masturbation of puberty is in fact no more than a revival of the masturbation of infancy, a subject which has hitherto invariably been neglected. Infantile masturbation reaches a kind of climax, as a rule, between the ages of three and four or five; and it is the clearest expression of a child's sexual constitution, in which the aetiology of subsequent neuroses must be sought. In this disguised way, therefore, the patients are putting the blame for their illnesses upon their infantile sexuality; and they are perfectly right in doing so. On the other hand, the problem of masturbation becomes insoluble if we attempt to treat it as a clinical unit, and forget that it can represent the discharge of every variety of sexual component and of every sort of phantasy to which such components can give rise. The injurious effects of masturbation are only in a very small degree [203]
autonomous – that is to say, determined by its own nature. They are in substance merely part and parcel of the pathogenic significance of the subject's sexual life as a whole. The fact that so many people can tolerate masturbation – that is, a certain amount of it – without injury merely shows that their sexual constitution and the course of development of their sexual life have been such as to allow them to exercise the sexual function within the limits of what is culturally permissible; whereas other people, because their sexual constitution has been less favourable or their development has been disturbed, fall ill as a result of their sexuality – they cannot, that is, achieve the necessary suppression or sublimation of their sexual components without having recourse to inhibitions or substitutes.[1]

Our present patient's behaviour in the matter of masturbation was most remarkable. He did not practise it during puberty [to any extent worth mentioning (p. 122 above)] and therefore, according to one set of views, he might have expected to be exempt from neurosis. On the other hand, an impulsion towards masturbatory activities came over him in his twenty-first year, s*hortly after his father's death*. He felt very much ashamed of himself each time he gave way to this kind of gratification,

1 See *Three Essays on the Theory of Sexuality*, 1905*d* [especially the 'Summary'; *RSE*, **7**, 204 ff. Further remarks on the subject of masturbation and of its possible injurious effects can be found in Freud's contributions to a discussion on that topic held by the Vienna Psychoanalytical Society (Freud, 1912*f*), ibid., **12**, 239 ff.]

and soon forswore the habit. From that time onwards it reappeared only upon rare and extraordinary occasions. It was provoked, he told me, when he experienced especially fine moments, or when he read especially fine passages. It occurred once, for instance, on a lovely summer's afternoon when, in the middle of Vienna, he heard a postilion blowing his horn in the most wonderful way – until a policeman stopped him, because blowing horns is not allowed in the centre of the town. And
[204] another time it happened when he read in *Dichtung und Wahrheit* [III, 11] how the young Goethe had freed himself in a burst of tenderness from the effects of a curse which a jealous mistress had pronounced upon the next woman who should kiss his lips after her; he had long, almost superstitiously, suffered the curse to hold him back, but now he broke his bonds and kissed his love joyfully again and again.

It seemed to the patient not a little strange that he should be impelled to masturbate precisely upon such beautiful and uplifting occasions as these. But I could not help pointing out that these two occasions had something in common – a prohibition, and the defiance of a command.

We must also consider in the same connection his curious behaviour at a time when he was working for an examination and toying with his favourite phantasy that his father was still alive and might at any moment reappear [p. 134 above]. He used to arrange that his working hours should be as late as possible in the night. Between twelve and one o'clock at night he would interrupt his work, and open the front door of the apartment as though his father were standing outside it; then, coming back into the hall, he would take out his penis and look at it in the looking-glass. This crazy conduct becomes intelligible if we suppose that he was acting as though he expected a visit from his father at the hour when ghosts are abroad. He had on the whole been idle at his work during his father's lifetime, and this had often been a cause of annoyance to his father. And now that he was returning as a ghost, he was to be delighted at finding his son hard at work. But it was impossible that his father should be delighted at the other part of his behaviour; in this therefore he must be defying him. Thus, in a single unintelligible obsessional act, he gave expression to the two sides of his relation with his father, just as he did subsequently with regard to his beloved lady by means of his obsessional act with the stone [pp. 145–6].

[205] Starting from these indications and from other data of a similar kind, I ventured to put forward a construction to the effect that when he was a child of under six he had been guilty of some sexual misdemeanour connected with masturbation and had been soundly castigated for it by his

father. This punishment, according to my hypothesis, had, it was true, put an end to his masturbating, but on the other hand it had left behind it an ineradicable grudge against his father and had established him for all time in his role of an interferer with the patient's sexual enjoyment.[1] To my great astonishment the patient then informed me that his mother had repeatedly described to him an occurrence of this kind which dated from his earliest childhood and had evidently escaped being forgotten by her on account of its remarkable consequences. He himself, however, had no recollection of it whatever. The tale was as follows. When he was very small – it became possible to establish the date more exactly owing to its having coincided with the fatal illness of an elder sister [p. 178 below] – he had done something naughty, for which his father had given him a beating. The little boy had flown into a terrible rage and had hurled abuse at his father even while he was under his blows. But as he knew no bad language, he had called him all the names of common objects that he could think of, and had screamed: 'You lamp! You towel! You plate!' and so on. His father, shaken by such an outburst of elemental fury, had stopped beating him, and had declared: 'The child will be either a great man or a great criminal!'[2] The patient believed that the scene made a permanent impression upon himself as well as upon his father. His father, he said, never beat him again; [206] and he also attributed to this experience a part of the change which came over his own character. From that time forward he was a coward [p. 142] – out of fear of the violence of his own rage. His whole life long, moreover, he was terribly afraid of blows, and used to creep away and hide, filled with terror and indignation, when one of his brothers or sisters was beaten.

The patient subsequently questioned his mother again. She confirmed the story, adding that at the time he had been between three and four years old and that he had been given the punishment because he had *bitten* someone. She could remember no further details, except for a very uncertain idea that the person the little boy had hurt might have

1 Compare my suspicions to a similar effect in one of the first sessions (p. 140). – [The importance of 'constructions' such as this in the technique of psychoanalysis was discussed by Freud in one of his last papers (1937*d*), *RSE*, **23**, 233 ff.]

2 These alternatives did not exhaust the possibilities. His father had overlooked the commonest outcome of such premature passions – a neurosis.

been his nurse. In her account there was no suggestion of his misdeed having been of a sexual nature.[1]

1 In psychoanalyses we frequently come across occurrences of this kind, dating back to the earliest years of the patient's childhood, in which his infantile sexual activity appears to reach its climax and often comes to a catastrophic end owing to some misfortune or punishment. Such occurrences are apt to appear in a shadowy way in dreams. Often they will become so clear that the analyst thinks he has a firm hold of them, and will nevertheless evade any final elucidation; and unless he proceeds with the greatest skill and caution he may be compelled to leave it undecided whether or not the scene in question actually took place. It will help to put us upon the right track in interpreting it if we recognize that more than one version of the scene (each often differing greatly from the other) may be detected in the patient's unconscious phantasies. If we do not wish to go astray in our judgement of their historical reality, we must above all bear in mind that people's 'childhood memories' are consolidated only at a later period, usually at the age of puberty; and that this involves a complicated process of remodelling, analogous in every way to the process by which a nation constructs legends about its early history. It at once becomes evident that in his phantasies about his infancy the individual as he grows up *endeavours to efface the recollection of his auto-erotic activities*; and this he does by exalting their memory traces to the level of object love, just as a real historian will view the past in the light of the present. This explains why these phantasies abound in seductions and assaults, where the facts will have been confined to auto-erotic activities and the caresses or punishments that stimulated them. Furthermore, it becomes clear that in constructing phantasies about his childhood the individual *sexualizes his memories*; that is, he brings commonplace experiences into relation with his sexual activity, and extends his sexual interest to them – though in doing this he is probably following upon the traces of a really existing connection. No-one who remembers my 'Analysis of a Phobia in a Five-Year-Old Boy' [1909*b*, p. 78 ff. above] will need to be told that it is not my intention in these remarks to retrospectively detract from the importance which I have hitherto attached to infantile sexuality by reducing it to nothing more than sexual interest at the age of puberty. I merely wish to give some technical advice that may help to clear up a class of phantasy which is calculated to falsify the picture of infantile sexual activity.

It is seldom that we are in the fortunate position of being able, as in the present instance, to establish the facts upon which these tales of the individual's prehistoric past are based, by recourse to the unimpeachable testimony of a grown-up person. Even so, the statement made by our patient's mother leaves the way open to various possibilities. That she did not proclaim the sexual character of the offence for which the child was punished may have been due to the activity of her own censorship; for with all parents it is precisely this sexual element in their children's past that their own censorship is most anxious to eliminate. But it is just as possible that the child was reproved by his nurse or by his mother herself for some commonplace piece of naughtiness of a nonsexual nature, and that his reaction was so violent that he was castigated by his father. In phantasies of this kind nurses and servants are regularly replaced by the superior figure of the mother. A deeper interpretation of the patient's dreams in relation to this episode revealed the clearest traces of the presence in his mind of an imaginative production of a positively epic character. In this his sexual desires for his mother and sister and his sister's premature death were linked up with the young hero's chastisement at his father's hand. It was impossible to unravel this tissue of phantasy thread by thread; the therapeutic success of the treatment was precisely what stood in the way of this. The patient recovered, and his ordinary life began to assert its claims: there were many tasks before him, which he had already neglected far too long, and which were incompatible with a continuation of the treatment. I am not to be blamed, therefore, for this gap in the analysis. The scientific results of psychoanalysis are at present only a by-product of its therapeutic aims, and for that reason it is often just in those cases where treatment fails that most discoveries are made.

The content of the sexual life of infancy consists in auto-erotic activity on the part of the dominant sexual components, in traces of object love, and in the formation of that complex which deserves to be called *the nuclear complex of the neuroses*. It is the complex which comprises the child's earliest impulses, alike tender and hostile, towards its parents and brothers and sisters, after its curiosity has been awakened – usually by the arrival of a new baby brother or sister. The uniformity of the content of the sexual life of children, together with the unvarying character of

A discussion of this childhood scene can be found in the footnote, and [207]
here I will remark only that its emergence shook the patient for the first
time in his refusal to believe that at some prehistoric period in his child-
hood he had been seized with fury (which had subsequently become
latent) against the father whom he loved so much. I must confess that I [208]
had expected it to have a greater effect, for the incident had been
described to him so often – even by his father himself – that there could
be no doubt of its objective reality. But, with that capacity for being
illogical which never fails to bewilder one in such highly intelligent [209]
people as obsessional neurotics, he kept urging against the evidential
value of the story the fact that he himself could not remember the scene.
And so it was only along the painful road of transference that he was able
to reach a conviction that his relation to his father really necessitated the
postulation of this unconscious complement. Things soon reached a
point at which, in his dreams, his waking phantasies and his
associations, he began heaping the grossest and filthiest abuse upon me
and my family, though in his deliberate actions he never treated me with
anything but the greatest respect. His demeanour as he repeated these
insults to me was that of a man in despair. 'How can a gentleman like
you, sir,' he used to ask, 'let yourself be abused in this way by a low, good-
for-nothing fellow like me? You ought to turn me out: that's all I deserve.'
While he talked like this, he would get up from the sofa and roam about
the room – a habit which he explained at first as being due to delicacy of
feeling: he could not bring himself, he said, to utter such horrible things
while he was lying there so comfortably. But soon he himself found a
more cogent explanation, namely, that he was avoiding my proximity for
fear of my giving him a beating. If he stayed on the sofa he behaved like

the modifying tendencies which are later brought to bear upon it, will easily account for the constant sameness which as a rule characterizes the phantasies that are constructed around the period of childhood, irrespective of how greatly or how little real experiences have contributed towards them. It is entirely characteristic of the nuclear complex of infancy that the child's father should be assigned the part of a sexual opponent and of an interferer with auto-erotic sexual activities; and real events are usually to a large extent responsible for bringing this about.

[The distinction between childhood memories and childhood phantasies preoccupied Freud throughout his career. See, for instance, his paper on 'Screen Memories' (1899*a*), *RSE*, **3**, 295 ff., and the discussions on 'primal phantasies' referred to in the additional footnote on pp. 7–8 *n.* 3 above. His doubts as to the validity of childhood memories go back to 1897 (see his letter to Fliess of September 21, Letter 69 in Freud, 1950*a*), though his conclusions on this point were not published till many years later (Freud, 1906*a*; *RSE*, **7**). On the other hand, in some of his very last writings he insists that there is always a grain of historical truth behind apparently mythological phantasies. See, e.g., *Moses and Monotheism* (1939*a*), ibid., **23**, 116 ff. – The term 'nuclear complex' had already been used by Freud, but in another sense, in his paper on 'The Sexual Theories of Children' (1908*c*), ibid., **9**, 187. The term 'Oedipus complex' seems to have been first used by him in his published writings a little later, in the first of his 'Contributions to the Psychology of Love' (1910*h*), ibid., **11**, 158.]

someone in desperate terror trying to save himself from castigations of terrific violence; he would bury his head in his hands, cover his face with his arm, jump up suddenly and rush away, his features distorted with pain, and so on. He recalled that his father had had a passionate temper, and sometimes in his violence had not known where to stop. Thus, little by little, in this school of suffering, the patient won the sense of conviction which he had lacked – though to any disinterested mind the truth would have been almost self-evident.

And now the path was clear to the solution of his rat idea. The treatment had reached its turning point, and a quantity of material information which had hitherto been withheld became available, and so made possible a reconstruction of the whole concatenation of events.

[210]

In my description I shall, as I have already said, content myself with the briefest possible summary of the circumstances. Obviously the first problem to be solved was why the two speeches of the Czech captain – his rat story [p. 128 above], and his request to the patient that he should pay back the money to Lieutenant A. [p. 129] – should have had such an agitating effect on him and should have provoked such violently pathological reactions. The presumption was that it was a question of 'complexive sensitiveness',[1] and that the speeches had jarred upon certain hyperaesthetic spots in his unconscious. And so it proved to be. As always happened with the patient in connection with military matters, he had been in a state of unconscious identification with his father, who had seen many years' service [p. 153] and had been full of stories of his soldiering days. Now it happened by chance – for chance may play a part in the formation of a symptom, just as the wording may help in the making of a joke – that one of his father's little adventures had an important element in common with the captain's request. His father, in his capacity as non-commissioned officer, had control over a small sum of money and had on one occasion lost it at cards. (Thus he had been a '*Spielratte*'.[2]) He would have found himself in a serious position if one of his comrades had not advanced him the amount. After he had left the army and become well-off, he had tried to find this friend in need so as to pay him back the money, but had not managed to trace him. The patient was uncertain whether he had ever succeeded in returning the money. The recollection of this sin of his father's youth was painful to him, for, in spite of appearances, his unconscious was filled with hostile strictures upon his father's

[211]

1 [A term borrowed from the word-association experiments of Jung and his school (Jung, 1906). So, too, below, p. 165.]

2 [Literally 'play-rat'. Colloquial German for 'gambler'.]t

character. The captain's words, 'You must pay back the 3.80 Kronen to Lieutenant A.', had sounded to his ears like an allusion to this unpaid debt of his father's.

But the information that the young lady at the post office at Z—— [Spas] had herself paid the charges due upon the packet, with a complimentary remark about himself [p. 133 above],[1] had intensified his identification with his father in quite another direction. At this stage in the analysis he brought out some new information, to the effect that the landlord of the inn at the little place where the post office was had had a pretty daughter. She had been decidedly encouraging to the smart young officer, so that he had thought of returning there after the manoeuvres were over and of trying his luck with her. Now, however, she had a rival in the shape of the young lady at the post office. Like his father in the tale of his marriage [p. 152], he could afford now to hesitate upon which of the two he should bestow his favours when he had finished his military service. We can see at once that his singular indecision whether he should travel to Vienna or go back to the place where the post office was, and the constant temptation he felt to turn back while he was on the journey (pp. 131–2), were not so senseless as they seemed to us at first. To his conscious mind, the attraction exercised upon him by Z——, the place where the post office was, was explained by the necessity of seeing Lieutenant A. and fulfilling the vow with his assistance. But in reality what was attracting him was the young lady at the post office, and the lieutenant was merely a good substitute for her, since he had[2] lived at the same place and had himself been in charge of the military postal service. And [212]
when subsequently he heard that it was not Lieutenant A. but another officer B., who had been on duty at the post office that day [p. 130], he drew *him* into his combination as well; and he was then able to reproduce in his deliria in connection with the two officers the hesitation he felt between the two girls who were so kindly disposed towards him.[3]

1 It must not be forgotten that he had learnt this *before* the captain, owing to a misapprehension, requested him to pay back the money to Lieutenant A. This circumstance was the vital point of the story, and by suppressing it the patient reduced himself to a state of the most hopeless muddle and for some time prevented me from getting any idea of the meaning of it all.

2 [The 'had' was added in 1924. See footnote 3 below.]

3 [*Footnote added* 1923:] My patient did his very best to throw confusion over the little episode of the repayment of the charges for his pince-nez, so that perhaps my own account of it may also

[213] In elucidating the effects produced by the captain's rat story we must follow the course of the analysis more closely. The patient began by producing an enormous mass of associative material, which at first, however, threw no light upon the circumstances in which the formation of his obsession had taken place. The idea of the punishment carried out by means of rats had acted as a stimulus to a number of his drives and had called up a whole quantity of recollections; so that, in the short interval between the captain's story and his request to him to pay back the money, rats had acquired a series of symbolic meanings, to which, during the period which followed, fresh ones were continually being added. I must confess that I can give only a very incomplete account of the whole business. What the rat punishment stirred up more than anything else was his *anal erotism*, which had played an important part in his childhood and had been kept in activity for many years by a constant irritation due

have failed to clear it up entirely [*ohne Rückstand*][t]. I therefore reproduce here a little map (Fig. 5), by means of which Mr and Mrs Strachey have endeavoured to make the situation at the end of the manoeuvres plainer. [Unfortunately the original map, printed in the German editions of 1924 and later, as well as in the English translation in Volume 3 of Freud's *Collected Papers* (p. 349), was itself totally inconsistent with some of the peculiar data presented in the case history. An entirely new one was therefore constructed for the *SE*; it takes account of fresh material contained in Freud's Original Record of the Case.] My translators have justly observed that the patient's behaviour remains unintelligible so long as a further circumstance is not expressly stated, namely, that Lieutenant A. had formerly lived at the place Z—— where the post office was situated and had been in charge of the military post office there, but that during the last few days he had handed over this billet to Lieutenant B. and had been transferred to another village. The 'cruel' captain had been in ignorance of this transfer, and this was the explanation of his mistake in supposing that the charges had to be paid back to Lieutenant A.

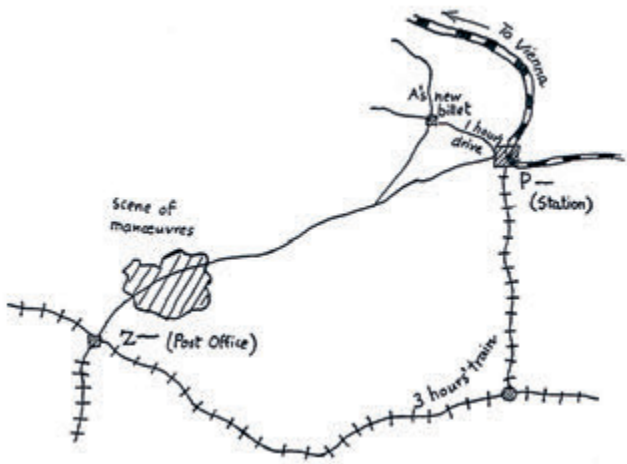

Fig. 5

to worms. In this way rats came to have the meaning of '*money*'.[1] The patient gave an indication of this connection by reacting to the word '*Ratten*' ['rats'] with the association '*Raten*' ['instalments']. In his obsessional deliria he had coined himself a regular rat currency. When, for instance, in reply to a question, I told him the amount of my fee for an hour's treatment, he said to himself (as I learnt six months later): 'So many florins, so many rats'. Little by little he translated into this language the whole complex of money interests which centred round his father's legacy to him; that is to say, all his ideas connected with that subject were, by way of the verbal bridge '*Raten – Ratten*', carried over [214]
into his obsessional life and brought under the dominion of his unconscious. Moreover, the captain's request to him to pay back the charges due upon the packet served to strengthen the money significance of rats, by way of another verbal bridge '*Spielratte*', which led back to his father's gambling debt [p. 160 above].

But the patient was also familiar with the fact that rats are carriers of dangerous infectious diseases; he could therefore employ them as symbols of his dread (justifiable enough in the army) of *syphilitic infection*. This dread concealed all sorts of doubts as to the kind of life his father had led during his term of military service. Again, in another sense, the *penis* itself is a carrier of syphilitic infection; and in this way he could consider the rat as a male organ of sex. It had a further title to be so regarded; for a penis (especially a child's penis) can easily be compared to a *worm*, and the captain's story had been about rats burrowing in someone's anus, just as the large roundworms had in his when he was a child. Thus the penis significance of rats was based, once more, upon anal erotism. And apart from this, the rat is a dirty animal, feeding upon excrement and living in sewers.[2] It is perhaps unnecessary[t] to point out how great an extension of the rat delirium became possible owing to this new meaning. For instance, 'So many rats, so many florins' could serve as an excellent characterization of a certain female profession which he particularly detested. On the other hand, it is certainly not a matter of indifference that the substitution of a penis for a rat in the captain's story resulted in a situation of intercourse *per anum*, which could not fail to be especially revolting to him when brought into connection with his father and the woman he loved. And when we consider that the same situation [215]
was reproduced in the compulsive threat which had formed in his mind

1 See my paper on 'Character and Anal Erotism' (1908*b*) [*RSE*, **9**, 149 ff.].

2 If the reader feels tempted to shake his head at the possibility of such leaps of imagination in the neurotic mind, I may remind him that artists have sometimes indulged in similar freaks of fancy. Such, for instance, are Le Poitevin's *Diableries érotiques*.

after the captain had made his request [p. 129 above], we shall be forcibly reminded of certain curses in use among the Southern Slavs.[1] Moreover, all of this material, and more besides, was woven into the fabric of the rat
Deckerinnerung discussions behind the screen association [*Deckeinfall*]^{T} '*heiraten*' ['to marry'].

The story of the rat punishment, as was shown by the patient's own account of the matter and by his facial expression as he repeated the story to me, had fanned into a flame all his prematurely suppressed impulses of cruelty, egoistic and sexual alike. Yet, in spite of all this wealth of material, no light was thrown upon the meaning of his obsessional idea until one day the Rat Wife in Ibsen's *Little Eyolf* came up in the analysis, and it became impossible to escape the inference that in many of the shapes assumed by his obsessional deliria rats had another meaning still – namely, that of *children*.[2] Enquiry into the origin of this new meaning at once brought me up against some of the earliest and most important roots. Once when the patient was visiting his father's grave he had seen a big beast, which he had taken to be a rat, gliding along over the grave.[3] He assumed that it had actually come out of his father's grave, and had just been having a meal off his corpse. The notion
[216] of a rat is inseparably bound up with the fact that it has sharp teeth with which it gnaws and bites.[4] But rats cannot be sharp-toothed, greedy and dirty with impunity: they are cruelly persecuted and mercilessly put to death by man, as the patient had often observed with horror. He had often pitied the poor creatures. But he himself had been just such a nasty,

1 The exact terms of these curses can be found in the periodical *Anthropophyteia* [**2**, (1905), 421 ff.], edited by F. S. Krauss. [See p. 234 below.]

2 Ibsen's Rat Wife must certainly be derived from the legendary Pied Piper of Hamelin, who first enticed away the rats into the water, and then, by the same means, lured the children out of the town, never to return. So too, Little Eyolf threw himself into the water under the spell of the Rat Wife. In legends generally the rat appears not so much as a disgusting creature but as something uncanny – as a chthonic animal, one might almost say; and it is used to represent the souls of the dead.

3 It was no doubt a weasel, of which there are great numbers in the Zentralfriedhof [the principal cemetery] in Vienna.

4 Compare the words of Mephistopheles [when he wishes to make his way through a door that is guarded by a magic pentagram]:

> Doch dieser Schwelle Zauber zu zerspalten
> Bedarf ich eines Rattenzahns.
> . . . . . .
> Noch einen Biss, so ist's geschehn!
>
> [But to break through the magic of this threshold
> I need a rat's tooth. (*He conjures up a rat.*)
> . . . . . .
> Another bite, and it is done!
>
> GOETHE, *Faust*, Part I (Scene 3).]

dirty little wretch, who was apt to bite people when he was in a rage, and had been fearfully punished for doing so (p. 157 above). He could truly be said to find 'a living likeness of himself' in the rat.[1] It was almost as though Fate, when the captain told him his story, had been putting him through an association test: she had called out a 'complex stimulus word' [see p. 160 *n*. 1], and he had reacted to it with his obsessional idea.

According, then, to his earliest and most momentous experiences, rats were children. And at this point he brought out a piece of information which he had kept away from its context long enough, but which now fully explained the interest he was bound to feel in children. The lady, whose admirer he had been for so many years, but whom he had nevertheless not been able to make up his mind to marry, was condemned to childlessness by reason of a gynaecological operation which had [217] involved the removal of both ovaries. This indeed – for he was extraordinarily fond of children – had been the chief reason for his hesitation.

It was only then that it became possible to understand the inexplicable process by which his obsessional idea had been formed. With the assistance of our knowledge of infantile sexual theories and of symbolism (as learnt from the interpretation of dreams) the whole thing could be translated and given a meaning. When, at the afternoon halt (during which he had lost his pince-nez), the captain had told him about the rat punishment, the patient had been struck at first only by the combined cruelty and lasciviousness of the situation depicted. But immediately afterwards a connection had been set up with the scene from his childhood in which he himself had bitten someone. The captain – a man who could defend such punishments – had become a substitute for his father, and had thus drawn down upon himself a part of the reviving animosity which had burst out, on the original occasion, against his cruel father. The idea which came into his consciousness for a moment, to the effect that something of the sort might happen to someone he was fond of, is probably to be translated into a wish such as 'You ought to have the same thing done to you!' aimed at the teller of the story, but through him at his father. A day and a half later,[2] when the captain had handed him the packet upon

1 [Er sieht in der geschwollnen Ratte
Sein ganz natürlich Ebenbild.
(For in the bloated rat he sees
A living likeness of himself.)
Faust, Part I, Scene in Auerbach's Cellar.]

2 Not that evening, as he first told me. It was quite impossible that the pince-nez he had ordered could have arrived the same day. The patient shortened the interval of time retrospectively, because it was the period during which the decisive mental connections had been set up, and

which the charges were due and had requested him to pay back the 3.80 Kronen to Lieutenant A. [p. 129 above], he had already been aware
[218] that his 'cruel superior' was making a mistake, and that the only person he owed anything to was the young lady at the post office. It might easily, therefore, have occurred to him to think of some derisive reply, such as, 'Will I, though?' or 'Pay your grandmother!' or 'Yes! You bet I'll pay him back the money!' – answers which would have been subject to no compulsive force. But instead, out of the stirrings of his father complex and out of his memory of the scene from his childhood, there formed in his mind some such answer as: 'Yes! I'll pay back the money to A. when my father and the lady have children!' or 'As sure as my father and the lady can have children, I'll pay him back the money!' In short, a derisive affirmation attached to an absurd condition which could never be fulfilled.[1]

But now the crime had been committed; he had insulted the two persons who were dearest to him – his father and his lady. The deed had called for punishment, and the penalty had consisted in his binding himself by a vow which it was impossible for him to fulfil and which entailed literal obedience to his superior's ill-founded request. The vow ran as follows: '*Now you must really pay back the money to A.*' In his convulsive obedience he had repressed his better knowledge that the captain's request had been based upon erroneous premises: 'Yes, you must pay back the money to A., as your father's surrogate has required. Your father cannot be mistaken.' So too the king cannot be mistaken; if he addresses one of his subjects by a title which is not his, the subject bears that title ever afterwards.

Only vague intelligence of these events reached the patient's consciousness. But his revolt against the captain's order and the sudden transformation of that revolt into its opposite were both represented there. First had come the idea that he was *not* to pay back the money, or
[219] it (that is, the rat punishment) would happen; and then had come the transformation of this idea into a vow to the opposite effect, as a punishment for his revolt [p. 129].

Let us, further, picture to ourselves the general conditions under which the formation of the patient's great obsessional idea occurred.

during which the repressed episode had taken place – the episode of his interview with the officer who told him of the friendly conduct of the young lady at the post office [p. 133 above].

[Since the manoeuvres ended on Monday, September 7, 1907, and the halt took place two days earlier, on Saturday afternoon, it is equally impossible that the pince-nez could have arrived a day and a half after he ordered them. This leaves insufficient time for the numerous events that followed the delivery of the pince-nez.]

1 Thus absurdity signifies derision in the language of obsessional thought, just as it does in dreams. See my *Interpretation of Dreams* [1900*a*, Chapter VI, Section G; *RSE*, **5**, 396–7].

His libido had been increased by a long period of abstinence coupled with the friendly welcome which a young officer can always reckon upon receiving when he goes among women. Moreover, at the time when he had started for the manoeuvres, there had been a certain coolness between himself and his lady. This intensification of his libido had inclined him to a renewal of his ancient struggle against his father's authority, and he had dared to think of having sexual intercourse with other women. His loyalty to his father's memory had grown weaker, his doubts as to his lady's merits had increased; and in that frame of mind he let himself be dragged into insulting the two of them, and had then punished himself for it. In doing so he had copied an old model. And when at the end of the manoeuvres he had hesitated so long whether he should travel to Vienna or whether he should stop and fulfil his vow, he had represented in a single picture the two conflicts by which he had from the very first been torn – whether or not he should remain obedient to his father and whether or not he should remain faithful to his beloved.[1]

I may add a word upon the interpretation of the 'sanction' which, it will be remembered, was to the effect that 'otherwise the rat punishment will be carried out on both of them'. It was based upon the influence of two infantile sexual theories, which I have discussed elsewhere.[2] The [220]
first of these theories is that babies come out of the anus; and the second, which follows logically from the first, is that men can have babies just as well as women. According to the technical rules for interpreting dreams, the notion of coming *out of* the rectum can be represented by the opposite notion of creeping *into* the rectum (as in the rat punishment), and *vice versa*.

We should not be justified in expecting such severe obsessional ideas as were present in this case to be cleared up in any simpler manner or by any other means. When we reached the solution that has been described above, the patient's rat delirium disappeared.

1 It is perhaps not uninteresting to observe that once again obedience to his father coincided with abandoning the lady. If he had stopped and paid back the money to A., he would have made atonement to his father, and at the same time he would have deserted his lady in favour of someone else more attractive. In this conflict the lady had been victorious – with the assistance, to be sure, of the patient's own normal good sense.
